PHYSICS ABSTRACTS

Physics Abstracts is one of a series of abstracts publications produced by INSPEC. Published twice monthly by the Institution of Electrical Engineers, it forms the world's major English-language abstracting service for the physics community.

SUBJECT SCOPE & COVERAGE

Physics Abstracts covers the whole field of physics. An impression of its scope can be gained from the classification scheme. The information contained in *Physics Abstracts* is derived from a wide range of sources including journals, reports, books, dissertations and conference papers published in all countries and languages of the world.

The number of items included is currently running at over 100,000 per year.

JOURNALS SCANNED

A list of the journals scanned for the INSPEC services is published with the twice-yearly author indexes to *Physics Abstracts*. Additions and amendments to this list are included in *Physics Abstracts* towards the end of the first issue for each month.

FORM OF ENTRY

All entries in *Physics Abstracts* follow the same basic pattern. The following example identifies the individual parts of a typical entry for an article from a journal.

Entry No. in PA ↓ **Title of paper** ↓

87093 PAC study of molecular rotational motions in dilute solutions.

Authors → A.Baudry, P.Boyer, J.D.Fabris, P.Vulliet (Lab. d'Interactions Hyperfines, CENG, Grenoble, France). ← **Author's affiliation**

Source of paper → *Hyperfine Interactions (Netherlands)*, vol.10, no.1-4, p.1057-62 (June 1981). (Proceedings of the Fifth International Conference on Hyperfine Interactions, Berlin, Germany, 21-25 July 1980).

The rotational tumbling of neutral chelates of hafnium dissolved in several organic solvents was studied via ^{181}Ta DPAC experiments. The results are compared with the predictions of a hydrodynamic model with partial slip boundary conditions. The influence of solute-solvent interactions and/or associations on the quadrupole relaxation is discussed. (16 refs.) } **Abstract**

Entries for other types of material differ mainly in the reference to the source, e.g., a report will refer to the report series and the number of the individual report. A conference paper on the other hand will normally refer to the title, place and date of the conference at which the paper was given.

SUBJECT ARRANGEMENT & SUBJECT GUIDE

The abstracts are arranged by subject in accordance with the scheme in the CLASSIFICATION and CONTENTS which appears opposite. The page number for the start of each subject section is given. An alphabetical index to the scheme—the SUBJECT GUIDE—follows the CLASSIFICATION and CONTENTS.

SUBJECT INDEXES

Detailed twice-yearly subject indexes to the individual entries are provided separately, covering the periods January-June and July-December. In these SUBJECT INDEXES each major concept occurring in each paper abstracted is indexed under headings drawn from the INSPEC Thesaurus.

AUTHOR INDEX

At the end of each issue, an alphabetical index of authors is provided showing the entry number of the items written by them. These indexes are cumulated every six months and, with the addition of the title of the individual papers, are published separately to cover the periods January-June and July-December of each year.

SUBSIDIARY INDEXES

Where appropriate, the following subsidiary indexes are included for the convenience of users:

Bibliography index of articles where a significant list of references or bibliography is contained.

Book index of books received and abstracted.

Corporate Author index where a corporate organisation rather than an individual is responsible for publication. This index includes all reports.

Conference index with reference to individual papers.

Subscription prices and ordering procedure are shown on the inside back cover.

PHYSICS ABSTRACTS is published twice monthly by the Institution of Electrical Engineers in association with the Institute of Electrical and Electronics Engineers Inc. Printed by Unwin Brothers Limited, The Gresham Press, Old Woking, Surrey. 2nd Class postage paid at Piscataway, N.J. 08854, USA. POSTMASTER: Send address changes to INSPEC/IEEE SERVICE CENTER, 445 Hoes Lane, Piscataway, N.J. 08854.

Physics Abstracts

CLASSIFICATION AND CONTENTS

The abstracts are arranged by subject in accordance with the following scheme. The page number for each section is given. The CLASSIFICATION AND CONTENTS is followed by an alphabetical guide to the scheme, the SUBJECT GUIDE.

The classification scheme is the result of cooperation between INSPEC, the American Institute of Physics, the European Physical Society and the Physics Working Group of the ICSU-AB.

0765 Optical spectroscopy and spectrometers 8427
0765E *UV and visible spectroscopy and spectrometers* 8428
0765G *IR spectroscopy and spectrometers* 8428
0768 Photography, photographic instruments and techniques 8428
0775 Mass spectrometers and mass spectrometry techniques 8430
0777 Particle beam production and handling; targets 8430
0780 Electron and ion microscopes and techniques 8430
0785 X-ray, gamma-ray instruments and techniques 8431
0790 Other topics in specialised instrumentation 8432

1000 **THE PHYSICS OF ELEMENTARY PARTICLES AND FIELDS** 8432

1100 GENERAL THEORY OF FIELDS AND PARTICLES 8432
1110 Field theory 8432
1120 S-matrix theory 8435
1130 Symmetry and conservation laws 8435
1140 Currents and their properties 8437
1150 Dispersion relations and sum rules 8437
1160 Complex angular momentum; Regge formalism —
1180 Relativistic scattering theory 8437
1190 Other topics in general field and particle theory —

1200 SPECIFIC THEORIES AND INTERACTION MODELS; PARTICLE SYSTEMATICS 8437
1210 Unified field theories and models 8437
1220 Models of electromagnetic interactions 8438
1220D *Specific calculations and limits of quantum electrodynamics* 8438
1220F *Experimental tests of quantum electrodynamics* 8439
1225 Models for gravitational interactions —
1230 Models of weak interactions 8439
1235 Composite models of particles 8439
1235C *General properties of quantum chromodynamics (dynamics, confinement, etc.)* 8439
1235E *Applications of quantum chromodynamics to particle properties and reactions* 8440
1235H *Phenomenological composite models of particle structure and reactions (partons, bags, etc.)* 8441
1235K *Other composite models* 8442

page
1240 Models of strong interactions 8442
1240E *Statistical models* 8442
1240F *Bootstrap models* 8442
1240H *Duality and dual models* 8442
1240K *Hadron classification schemes* —
1240M *Complex angular momentum plane; Regge poles and cuts (Reggeons)* 8442
1240P *Absorptive, optical, and eikonal models* —
1240Q *Potential models* 8443
1240R *Peripheral models (one or more particle exchange)* 8443
1240S *Multiperipheral and multi-Regge models* —
1240V *Vector-meson dominance* 8443
1270 Hadron mass formulas 8443
1290 Miscellaneous theoretical ideas and models —

1300 SPECIFIC REACTIONS AND PHENOMENOLOGY 8443
1310 Weak and electromagnetic interactions of leptons 8443
1315 Neutrino interactions 8443
1320 Leptonic and semileptonic decays of mesons 8444
1325 Hadronic decays of mesons 8444
1330 Decays of baryons 8444
1335 Decays of leptons 8444
1340 Electromagnetic processes and properties 8445
1340D *Electromagnetic mass differences* 8445
1340F *Electromagnetic form factors; electric and magnetic moments* 8445
1340H *Electromagnetic decays* 8446
1340K *Electromagnetic corrections to strong and weak interaction processes* 8446
1360 Photon and charged-lepton interactions with hadrons 8446
1360F *Elastic and Compton scattering* 8446
1360H *Total and inclusive cross sections* 8446
1360K *Meson production* —
1360M *Meson-resonance production* 8446
1360P *Baryon and baryon resonance production* 8446
1365 Hadron production by electron-positron collisions 8446
1375 Hadron-induced low- and intermediate-energy reactions and scattering, energy $\leq$ 10 GeV 8447
1375C *Nucleon-nucleon interactions, including antinucleon, deuteron, etc. (energy $\leq$ 10 GeV)* 8447
1375E *Hyperon-nucleon interactions (energy $\leq$ 10 GeV)* —
1375G *Pion-baryon interactions (energy $\leq$ 10 GeV)* 8447
1375J *Kaon-baryon interactions (energy $\leq$ 10 GeV)* 8447
1375L *Meson-meson interactions (energy $\leq$ 10 GeV)* —
1385 Hadron-induced high- and super-high-energy interactions, energy $>$ 10 GeV 8447
1385D *Elastic scattering (energy $>$ 10 GeV)* 8447
1385F *Inelastic scattering, two-particle final states (energy $>$ 10 GeV)* —
1385H *Inelastic scattering, many-particle final states (energy$>$10GeV)* 8448
1385K *Inclusive reactions, including total cross sections, (energy $>$ 10 GeV)* 8448
1385M *Cosmic ray interactions* 8450
1388 Polarisation in interactions and scattering 8450
1390 Other topics in specific reactions and phenomenology of elementary particles 8450

1400 PROPERTIES OF SPECIFIC PARTICLES AND RESONANCES 8450
1420 Baryons and baryon resonances 8450
1440 Mesons and meson resonances 8451
1460 Leptons 8451
1480 Other and hypothetical particles 8451

2000 **NUCLEAR PHYSICS** 8452

2100 NUCLEAR STRUCTURE 8452
2110 General and average properties of nuclei; properties of nuclear energy levels 8452
2110D *Binding energy and masses* 8453
2110F *Shape, charge, radius and form factors* 8453
2110H *Spin, parity, and isobaric spin* 8454
2110J *Spectroscopic factors* 8454
2110K *Electromagnetic moments* 8454
2110M *Level density and structure* 8455
2130 Nuclear forces 8455
2140 Few-nucleon systems 8456
2160 Nuclear-structure models and methods 8456
2160C *Shell model* 8456
2160E *Collective models* 8456
2160F *Models based on group theory* 8457
2160G *Cluster models* 8458
2160J *Hartree-Fock and random-phase approximations* 8458
2165 Nuclear matter 8458
2180 Hypernuclei 8458
2190 Other topics in nuclear structure —

2300 RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS 8459
2320 Electromagnetic transitions 8459
2320C *Lifetimes and transition probabilities* 8459
2320N *Internal conversion and extranuclear effects* —
2340 beta decay; electron and muon capture 8459
2360 alpha decay 8459
2390 Other topics in nuclear decay and radioactivity 8460

2400 NUCLEAR REACTIONS AND SCATTERING: GENERAL 8460
2410 Nuclear reaction and scattering models and methods 8460
2410H *Optical and diffraction models* 8461
2430 Resonance reactions and scattering 8461
2450 Direct reactions 8462
2460 Statistical theory and fluctuations 8462
2470 Polarization in reactions and scattering 8463
2475 General properties of fission 8463
2490 Other topics in nuclear reactions and scattering, general —

2500 NUCLEAR REACTIONS AND SCATTERING: SPECIFIC REACTIONS 8463
2510 Nuclear reactions and scattering involving few-nucleon systems 8463
2520 Photonuclear reactions and photon scattering 8464
2530 Lepton-induced reactions and scattering 8464
2540 Nucleon-induced reactions and scattering 8464
2550 ^{2}H- and ^{3}H-induced reactions and scattering 8466
2560 ^{3}He- and ^{4}He-induced reactions and scattering 8467
2570 Heavy ion induced reactions and scattering 8468
2580 Meson- and hyperon-induced reactions and scattering 8470
2585 Fission reactions 8471
2588 Fusion reactions 8471
2590 Other topics in nuclear reactions and scattering: specific reactions 8471

2700 PROPERTIES OF SPECIFIC NUCLEI LISTED BY MASS RANGES 8471
2710 $A \leq 5$ 8471
2720 $6 \leq A \leq 19$ 8471
2730 $20 \leq A \leq 38$ 8472
2740 $39 \leq A \leq 58$ 8472
2750 $59 \leq A \leq 89$ 8472
2760 $90 \leq A \leq 149$ 8472
2770 $150 \leq A \leq 189$ 8473
2780 $190 \leq A \leq 219$ 8473
2790 $220 \leq A$ 8473

2800 NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES 8473
2820 Neutron physics 8473
2841 Fission reactor theory and design 8473
2842 Fission reactor materials 8474
2842H *Fuel preparation and reprocessing* 8482
2843 Fission reactor operation 8483
2844 Fission reactor protection systems, safety and accidents 8485
2850 Fission reactor types and applications 8488
2852 Fusion reactors 8489
2858 Integrated reactor systems 8490
2870 Nuclear explosions —
2880 Radiation technology, including shielding 8490
2890 Other topics in nuclear engineering and nuclear power studies 8491

2900 EXPERIMENTAL METHODS AND INSTRUMENTATION FOR ELEMENTARY-PARTICLE AND NUCLEAR PHYSICS 8491
2910 Preacceleration (injection) —
2915 Electrostatic and linear particle accelerators 8491
2920 Cyclic accelerators and storage facilities 8491
2925 Particle sources and targets, preparation and technology 8491
2930 Radiation spectrometers and spectroscopic techniques 8492
2940 Radiation detectors 8493
2960 Counting circuits and nuclear electronics 8495
2970 Radiation measurement, detection and counting 8495
2975 Polarization analysis —
2980 Nuclear information processing 8496
2990 Other topics in high-energy and nuclear experimental methods and instrumentation 8496

3000 **ATOMIC AND MOLECULAR PHYSICS** 8496

3100 THEORY OF ATOMS AND MOLECULES 8496
3110 General theory of structure, transitions and chemical binding 8496
3115 General mathematical and computational developments 8497
3120 Specific calculations and results 8497
3120D *Complete ab initio calculations (exact or nearly exact calculations on small species)* —
3120E *Ab initio LCAO and GO SCF calculations* 8499
3120G *Other accurate, or nearly ab initio calculations (DIM method, SAMO method, etc.)* 8499
3120L *Statistical model calculations (Thomas-Fermi and Thomas-Fermi-Dirac models)* 8499
3120N *Semi-empirical NDO calculations (CNDO, INDO, MINDO, PCILO methods, etc.)* 8499

page
3120P *Other semi-empirical calculations (Hückel, generalized Hückel, PPP methods, etc.)* 8500
3120R *Valence bond calculations (ab initio or not)* 8500
3120T *Electron correlation and CI calculations* 8500
3120W *Empirical methods (nonquantum methods for conformations, as Wiberg method, Westheimer method, etc.)* —
3130 Corrections to electronic structure 8500
3150 Excited states 8501
3170 Effects of molecular interactions on electronic structure 8502
3170D *Environmental and solvent effects* 8502
3170F *Potential-energy surfaces for collisions* 8502
3170H *Time-dependent phenomena: excitation and relaxation processes, and reaction rates* —
3170K *Molecular solids* —
3190 Other topics in the theory of atoms and molecules 8502

3200 ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS 8502
3220 Atomic spectra grouped by wavelength ranges 8502
3220B *Radiofrequency, microwave, and infrared spectra* —
3220J *Visible and ultraviolet spectra* 8502
3220R *X-ray spectra* 8503
3250 Fluorescence, phosphorescence 8503
3260 Zeeman and Stark effects 8503
3270 Spectral line shapes and intensities 8503
3280 Photon interactions with atoms 8504
3280B *Level crossing and optical pumping* 8504
3280D *Autoionization* 8504
3280F *Photoionization and photodetachment* 8505
3280H *Auger effect and inner-shell ionization* 8505
3280K *Multiphoton processes* 8505
3290 Other topics in atomic spectra and interactions with photons 8506

3300 MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS 8506
3310 Calculation of molecular spectra 8506
3320 Molecular spectra grouped by wavelength ranges 8507
3320B *Radiofrequency and microwave spectra* 8507
3320E *Infrared spectra* 8508
3320F *Raman and Rayleigh spectra* 8509
3320K *Visible spectra* 8510
3320L *Ultraviolet spectra* 8510
3320N *Vacuum ultraviolet spectra* —
3320R *X-ray spectra* 8511
3325 Nuclear magnetic resonance and relaxation; nuclear quadrupole resonance (NQR) 8511
3330 Electron paramagnetic resonance and relaxation 8513
3335 Double resonances and other multiple resonances 8513
3335H *MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)* 8513
3340 Mössbauer spectra 8514
3345 Magneto-optical and electro-optical spectra; dichroism 8514
3345B *Zeeman and Stark effects* 8514
3345C *Magnetic circular dichroism* 8514
3350 Fluorescence, phosphorescence; radiationless transitions (intersystem crossing, internal conversion) 8514
3365 Photoelectron spectra 8515
3370 Intensities and shapes of molecular spectral lines and bands 8515
3380 Photon interactions with molecules 8516
3380B *Level crossing and optical pumping* 8516
3380E *Autoionization, photoionization, and photodetachment* 8516
3380G *Diffuse spectra; predissociation, photodissociation* 8517
3380K *Multiphoton processes* 8517
3390 Other topics in molecular spectra and interactions with photons —

3400 ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS 8517
3410 General theories and models —
3420 Interatomic and intermolecular potentials and forces 8517
3440 Elastic scattering of atoms and molecules 8518
3450 Inelastic scattering of atoms and molecules 8518
3450E *Rotational and vibrational energy transfer* 8519
3450H *Electronic excitation and ionization (inc. beam-foil excitation and ionization)* 8519
3450L *Chemical reactions, energy disposal, and angular distribution, as studied by atomic and molecular beams* 8520
3470 Charge transfer 8520
3480 Electron scattering 8521
3480B *Elastic scattering of electrons by atoms and molecules* 8522
3480D *Atomic excitation and ionization by electron impact* 8522
3480G *Molecular excitation, ionization, and dissociation by electron impact* 8523
3490 Other topics in atomic and molecular collision processes and interactions 8524

page
3500 PROPERTIES OF ATOMS AND MOLECULES; INSTRUMENTS AND TECHNIQUES 8524
3510 Atoms 8524
3510B *Atomic masses, mass spectra, abundances, and isotopes* 8524
3510D *Electric and magnetic moments, polarizability* 8524
3510F *Relativistic corrections, fine- and hyperfine-structure constants* 8524
3510H *Ionization potentials, electron affinities* 8525
3510W *Weak Interactions* —
3520 Molecules 8525
3520B *General molecular conformation and symmetry; stereochemistry* 8525
3520D *Interatomic distances and angles* 8525
3520G *Bond strengths, dissociation energies, hydrogen bonding, etc* 8525
3520J *Barrier heights (internal rotation, inversion); rotational isomerism, conformational dynamics* 8525
3520M *Electric and magnetic moments (and derivatives), polarizability, and magnetic susceptibility* 8526
3520P *Rotation, vibration, and vibration-rotation constants* 8526
3520S *Hyperfine and fine-structure constants* 8526
3520V *Ionization potentials, electron affinities, molecular core binding energy* 8526
3520W *Weak interactions* —
3520X *Mass spectra* 8526

7510 General theory and models of magnetic ordering 8689
7510D *Crystal-field theory and spin Hamiltonians* 8689
7510H *Ising and other classical spin models* 8689

page
7510J *Heisenberg and other quantized localized spin models* 8690
7510L *Band and itinerant models* 8690
7520 Diamagnetism and paramagnetism 8690
7520C *Nonmetals* 8690
7520E *Metals and alloys* 8690
7520H *Local moment in dilute alloys; Kondo effect* 8691
7525 Spin arrangements in magnetically ordered materials (neutron studies, etc) 8691
7530 Magnetically ordered materials, other intrinsic properties 8692
7530C *Saturation moments and magnetic susceptibility* 8692
7530D *Spin waves* 8693
7530E *Exchange and superexchange interactions* 8694
7530G *Anisotropy* 8694
7530H *Magnetic impurity interactions* —
7530K *Magnetic phase boundaries* 8694
7530S *Magnetocaloric effect* 8695
7540 Critical-point effects, specific heats, short-range order 8695
7540D *Ising and other classical spin models* 8697
7540F *Heisenberg and other quantized spin models* 8697
7550 Studies of specific magnetic materials 8697
7550B *Ferromagnetism of Fe and its alloys* 8697
7550C *Ferromagnetism of other metals* 8698
7550D *Ferromagnetism of nonmetals* 8698
7550E *Antiferromagnetics* 8698
7550G *Ferrimagnetics* 8698
7550K *Amorphous magnetic materials* 8698
7550M *Magnetic liquids* 8699
7560 Domain effects, magnetization curves, and hysteresis 8699
7560C *Domain walls and domain structure* 8699
7560E *Magnetization curves, hysteresis, Barkhausen and related effects* 8699
7560G *High coercivity materials* 8700
7560J *Fine-particle systems* 8700
7560L *Magnetic aftereffects* 8700
7560N *Magnetic annealing and temperature-hysteresis effects* 8700
7570 Magnetic films and plates 8700
7570K *Domain structure (magnetic bubbles)* 8701
7580 Magnetomechanical and magnetoelectric effects, magnetostriction 8701
7590 Other topics in magnetic properties and materials —

7600 MAGNETIC RESONANCES AND RELAXATION IN CONDENSED MATTER; MÖSSBAUER EFFECT 8701
7620 General theory of resonances and relaxation 8701
7630 Electron paramagnetic resonance and relaxation 8702
7630D *Ions and impurities: general* 8702
7630F *Iron group (3d) ions and impurities (Ti-Cu)* 8702
7630H *Platinum and palladium group (4d and 5d) ions and impurities (Zr-Ag and Hf-Au)* 8703
7630K *Rare-earth ions and impurities* 8703
7630L *Other ions and impurities* 8703
7630M *Colour centres and other defects* 8703
7630P *Conduction electrons* —
7630R *Free radicals* 8704
7640 Diamagnetic and cyclotron resonances 8704
7650 Ferromagnetic, antiferromagnetic, and ferrimagnetic resonances; spin wave resonance 8704
7660 Nuclear magnetic resonance and relaxation 8704
7660C *Chemical and Knight shifts* 8705
7660E *Relaxation effects* 8706
7660G *Quadrupole resonance* 8707
7660L *Spin echoes* 8707
7670 Magnetic double resonances and cross effects 8708
7670D *Electron-nuclear double resonance (ENDOR)* 8708
7670E *Dynamical nuclear polarization* —
7670F *Double nuclear magnetic resonance (DNMR)* 8708
7670H *Optical double magnetic resonance (ODMR)* 8708
7670K *Electron double resonance (ELDOR)* —
7680 Mössbauer effect; other gamma-ray spectroscopy 8708
7690 Other topics in magnetic resonances and relaxation 8709

7700 DIELECTRIC PROPERTIES AND MATERIALS 8709
7720 Permittivity 8709
7730 Polarization and depolarization effects 8710
7740 Dielectric loss and relaxation 8710
7750 Dielectric breakdown and space-charge effects 8711
7755 Dielectric thin films 8711
7760 Piezoelectricity and electrostriction 8711
7770 Pyroelectric and electrocaloric effects 8711
7780 Ferroelectricity and antiferroelectricity 8711
7780B *Transitions and Curie point* 8712
7780D *Domain structure and effects; hysteresis* 8712
7785 Electrical resonances —
7790 Other topics in dielectric properties and materials 8713

7800 OPTICAL PROPERTIES AND CONDENSED MATTER SPECTROSCOPY AND OTHER INTERACTIONS OF MATTER WITH PARTICLES AND RADIATION 8713
7820 Optical properties and materials 8713
7820B *General theory (for pure homogeneous materials)* —

page
7820D *Optical constants and parameters* 8713
7820E *Optical rotatory power* 8714
7820F *Birefringence* 8714
7820H *Piezo-, elasto- and acousto-optical effects* 8714
7820J *Electro-optical effects* 8715
7820L *Magneto-optical effects* 8715
7820N *Thermo-optical effects* 8715
7830 Infrared and Raman spectra and scattering 8715
7835 Brillouin and Rayleigh scattering 8717
7840 Visible and ultraviolet spectra 8718
7845 Stimulated emission 8719
7850 Impurity and defect absorption in solids 8719
7855 Photoluminescence 8719
7860 Other luminescence spectra and radiative recombination 8722
7860F *Electroluminescence* 8722
7860H *Cathodoluminescence, ionoluminescence* 8722
7860K *Thermoluminescence* 8722
7860M *Sonoluminescence, triboluminescence* —
7860P *Chemiluminescence* —
7865 Optical properties of thin films 8722
7870 Other interactions of matter with particles and radiation 8723
7870B *Positron annihilation* 8723
7870C *X-ray scattering* 8724
7870D *X-ray absorption and absorption edges* 8724
7870E *X-ray emission threshold and fluorescence* 8724
7870G *Microwave and radiofrequency interactions* —
7890 Other topics in optical properties of condensed matter and other interactions of matter with particles and radiation —

7900 ELECTRON AND ION EMISSION BY LIQUIDS AND SOLIDS; IMPACT PHENOMENA 8725
7920 Impact phenomena 8725
7920D *Laser-light impact phenomena* 8725
7920F *Electron impact: Auger emission* 8725
7920H *Electron impact: secondary emission* 8726
7920K *Other electron impact phenomena* 8726
7920N *Atom, molecule, and ion impact* 8727
7920R *Atomic and molecular beam interactions* 8728
7940 Thermionic emission 8728
7960 Photoemission and photoelectron spectra 8728
7970 Field emission and field ionization 8730
7975 Exoelectron emission 8730
7980 Resonance tunnelling —
7990 Other topics in emission and impact phenomena in condensed matter 8730

8000 CROSS-DISCIPLINARY PHYSICS AND RELATED AREAS OF SCIENCE AND TECHNOLOGY 8731

8100 MATERIALS SCIENCE 8731
8110 Methods of crystal growth and purification 8731
8110B *Growth from vapour* 8731
8110D *Growth from solutions* 8731
8110F *Growth from melts* 8731
8110H *Zone melting and zone refining* 8732
8110J *Growth from solid phases* 8732
8115 Methods of thin film deposition 8733
8115C *Deposition by cathodic sputtering* 8733
8115G *Vacuum deposition* 8733
8115H *Chemical vapour deposition* 8734
8115J *Ion plating and other vapour deposition* 8734
8115L *Deposition from liquid phases (melts and solutions)* 8735
8120 Other methods of preparation of materials 8735
8120C *Vacuum methods* —
8120E *Powder techniques, compaction and sintering* 8735
8120G *Specific metals and alloys (compacts, pseudoalloys)* 8736
8120J *Dispersion-fibre-, and platelet-reinforced metal-based composites* 8736
8120L *Ceramics and refractories* 8737
8120N *Cermets, ceramic and refractory composites* 8738
8120P *Glasses* 8738
8120Q *Glass-based composites, vitroceramics* —
8120S *Polymers* 8738
8120T *Reinforced polymers and polymer-based composites* 8738
8130 Phase diagrams and microstructures developed by solidification and solid-solid phase transformations 8738
8130B *Phase diagrams of metals and alloys* 8738
8130D *Phase diagrams of other materials* 8740
8130F *Solidification* 8742
8130H *Constant-composition solid-solid phase transformations: polymorphic, massive, and order-disorder* 8743
8130K *Martensitic transformations* 8743
8130M *Precipitation* 8744
8140 Treatment of materials and its effects on microstructures and properties 8745
8140C *Solid solution hardening, precipitation hardening, dispersion hardening* 8745

page
8140E *Cold working, work hardening; annealing, recovery and recrystallisation; textures* 8746
8140G *Other heat and thermomechanical treatments* 8747
8140J *Elasticity and anelasticity* 8751
8140L *Deformation, plasticity and creep* 8751
8140N *Fatigue, embrittlement, and fracture* 8756
8140P *Friction, lubrication, and wear* 8762
8140R *Electrical and magnetic properties (related to treatment conditions)* 8764
8140T *Optical properties (related to treatment conditions)* 8764
8160 Corrosion, oxidation and surface treatments 8764
8160B *Metals and alloys* 8765
8170 Materials testing 8769
8190 Other topics in materials science 8775

8200 PHYSICAL CHEMISTRY 8775
8220 Chemical kinetics 8775
8220K *Potential energy surfaces for chemical reactions* 8776
8220M *Nonequilibrium kinetics* —
8220R *Energy distribution and transfer, relaxation* 8776
8230 Specific chemical reactions; reaction mechanisms 8776
8235 Polymer reactions and polymerization 8778
8240 Chemical kinetics and reactions: special regimes 8778
8240D *Atomic and molecular beam reactions* 8779
8240T *Chemiluminescence and chemical laser kinetics* 8779
8245 Electrochemistry and electrophoresis 8779
8250 Photochemistry and radiation chemistry 8780
8250E *Photodissociation, photoionization as studied by luminescence and radiationless transitions* 8781
8255 Radiochemistry 8782
8260 Chemical thermodynamics 8782
8265 Surface processes 8783
8270 Disperse systems 8784
8280 Chemical analysis and related physical methods of analysis 8785
8290 Other topics in physical chemistry 8786

8600 ENERGY RESEARCH AND ENVIRONMENTAL SCIENCE 8787
8610 Energy resources and their utilisation 8787
8610B *Fossil and other fuels* 8787
8610D *Wind energy* 8787
8610F *Tidal and flow energy* —
8610H *Geothermal energy* 8787
8610K *Solar energy* 8787
8610N *Nuclear energy* 8788
8610Z *Other topics* —
8630 Energy conversion 8788
8630D *Electrochemical conversion: general* 8788
8630E *Primary cells* 8788
8630F *Secondary cells* 8789
8630G *Fuel cells* 8789
8630J *Photoelectric conversion: solar cells and arrays* 8790
8630K *Photoelectrochemical conversion* 8791
8630L *Electrogasdynamic and magnetohydrodynamic conversion* 8791
8630M *Thermoelectric conversion* 8791
8630N *Thermionic conversion* 8791
8630P *Photosynthesis* 8791
8630Q *Chemical energy conversion* 8791
8630R *Thermal energy conversion (heat engines and heat pumps)* 8791
8630S *Photothermal conversion* 8792
8630Z *Other topics* —
8640 Energy storage (secondary energy) 8792
8640C *Storage in mechanical energy* —
8640F *Storage in thermal energy* 8792
8640H *Storage in chemical energy* —
8640K *Hydrogen storage and technology* 8792
8640Z *Other topics* —
8660 Requirement for energy: ecological aspects —
8670 Environmental science 8793
8670C *Soil* 8793
8670E *Water* 8793
8670G *Atmosphere* 8793
8670J *Noise* 8794
8670L *Measurement techniques in environmental science* 8794
8670Z *Other topics* 8795

SUBSIDIARY INDEXES

SUBJECT GUIDE

The SUBJECT GUIDE is an alphabetical index to subjects covered in the classification scheme, by which the abstracts are arranged. The numbers given are classification codes. The CLASSIFICATION AND CONTENTS, which precede the Guide, gives the page number for each section.

	Classification
A mesons	1440
Ab initio calculations	3120
Aberrations	4180, 4230, 4278
Abrasion	4630P, 6220P, 8140P
Absorptive models	1240P
Acceleration measurement	0630G
Accumulation layers	7320, 7340Q
Acoustic devices	4385
Acoustic holography	4363
Acoustic noise	4350, 4360, 4388, 8670J
Acoustic nuclear magnetic resonance	7660
Acoustic paramagnetic resonance	7630
Acoustic properties of gases	5140
Acoustic properties of liquids	6260
Acoustic properties of solids	6265
Acoustic signal processing	4360
Acoustic wave propagation	4320, 4325, 5140, 6260, 6265
Acoustics	43
Acousto-optical effects	5140, 5170, 7820H
Acoustoelectric effects	4388, 5140, 5150, 7250
Adaptive optics	42
Adherence	4630P
Adhesion	4630P, 6825, 8190
Adsorption	6845, 8265
Aerodynamics	4740
Aeroelasticity	4630C, 4630M
Aeronomy	94
Aerosols	4755K, 8270, 92
Aerospace	9480, 9555
Aerospace biophysics	8765
Ageing	8140G
Airglow	9410Q
Algebra	0210
Alpha decay	2360
Alpha particle-nucleus reactions	2560
Alpha particle-nucleus scattering	2560
Alpha particle spectroscopy	2930
Alpha particles	2140, 2710
Amorphous semiconductors	6140, 7125M, 7220, 7280N
Amorphous state	6140, 81
Anderson model	7110, 7125M, 7155
Anelasticity	4630J, 6240, 8140J
Anemometers	4780, 9385
Angular measurement	0630C
Annealing	8140E, 8140G
Anodisation	8160, 8245
Antiferrimagnetism	7530
Antiferroelectric materials	7780
Antiferromagnetic properties of substances	75, 7550E
Antiferromagnetic resonance	7650
Antiphase boundaries	81
Antiphase domains	81
Antireflection coatings	4270, 4278H, 4280
Appearance potential spectroscopy	0785, 7870E
APW calculations	7110, 7125C
Architectural acoustics	4355
Artificial limbs	8770J
Artificial organs	8770J
Association	6120, 6125, 8230
Asteroids	9630H
Astroarchaeology	9590
Astrometry	95, 9555

105007 Lecture to American College of Radiology [medical image processing]. C.C.Jaffe (Dept. of Diagnostic Radiology, Yale Univ. of School of Medicine, New Haven, CT, USA).
IEEE Trans. Med. Imaging (USA), vol.MI-1, no.4, p.226-9 (Dec. 1982). [received: Sept. 1983]
Image processing applied to medicine is more constrained than in other fields. Lacking means of verification, as is often the case, it is difficult to judge what constitutes a success or how the ideal image should look. Most successful processing efforts to date have been directed at correcting distortions introduced by shortcomings in the imaging equipment itself or methods for filling in missing data sets. Some important headway has been made in processing which is directed at providing a better match to human visual psychophysics particularly in matrix images. The greatest future opportunities appear to lie in image integration of several different imaging modalities of the same body part and utilization of a priori information as a factor in image formation. (no refs.)

105008 Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions.
Prog. Theor. Phys. Suppl. (Japan), no.74-75 (1983).
Conference held at: Kyoto, Japan. Date 12-16 July 1982. Sponsors: Yukawa Found.; Yamada Sci. Found. The Summer Institute is devoted to recent developments of microscopic theories for collective states of transitional nuclei and giant resonance states, covering the topics such as algebraic approach, boson-fermion expansion, mode-mode coupling theory, nuclear field theory, nuclear response theory, sum rule approach, TDHF and its extension. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

01.30C Conference proceedings

105009 4th Italian National Meeting on Applied Electromagnetics.
Alta Freq. (Italy), vol.52, no.3 (May-June 1983).
Conference held at: Florence, Italy. Date 4-6 Oct. 1982. The following topics were dealt with: scattering and inverse problems; antennas; MM waves; nonlinear EM problems; bioelectromagnetics; microwave circuits and components; optical fibres; integrated and micro-optics; propagation in natural media; remote sensing. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105010 3rd Tri-Service Cathode Workshop.
Appl. Surf. Sci. (Netherlands), vol.16, no.1-2 (May-June 1983).
Conference held at: Fort Monmouth, NJ, USA. Date 23-26 March 1982. The following topics were dealt with: tungsten based dispenser cathodes; M-type cathode activation; impregnated cathodes; Ba thin films; $BaO-CaO-Al_2O_3$ dispenser cathode impregnants; Ba-O-W cathode characterization; diode characteristics and cathode emission capability; work function distribution; laser excited high emission cathodes; high current photocathodes; field emission cathode arrays; Spindt-type field emitting cathodes; and secondary emission properties. 20 papers are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105011 Proceedings of the British Institute of Radiology, Radiobiology Work-in-Progress Meeting (papers in summary form only received).
Br. J. Radiol. (GB), vol.56, no.669 (Sept. 1983).
Conference held at: London, England. Date 18 Feb. 1983. Papers in summary form only received. The topics dealt with included: the radiation response of V79 and human tumour multicellular spheroids; the relation of clonogenic cell survival to functional impairment by irradiation of self-renewing normal tissues; some early effects of thoracic irradiation in mice; fractionated response of mouse kidneys to irradiation; nonstochastic effects of beta-irradiation of mouse skin; the interaction of neutrons and X-rays on mouse skin; life shortening in mice following inhalation of sized aerosols of $^{239}PuO_2$. 11 papers were presented.

105012 162nd Meeting of the American Astronomical Society (papers in summary form only received).
Bull. Am. Astron. Soc. (USA), vol.15, no.2 (1983).
Conference held at: St. Paul, MN, USA. Date 19-22 June 1983. The following topics were dealt with: supernovae, variable stars, planets, interstellar matter, Sun, instruments, stars, active galaxies, quasars, Solar System, dust, stellar atmospheres, white dwarf, galaxies, binary stars, massive stars, pulsars, X-ray sources and galactic structure.

105013 Annual Meeting of the Division on Solar Physics of the American Astronomical Society.
Bull. Am. Astron. Soc. (USA), vol.15, no.2 (1983).
Conference held at: Pasadena, CA, USA. Date 22-24 June 1983. The following topics were dealt with: flare observations and spectral line effects, rotation, activity cycle, heliosphere, heating, magnetic reconnection, magnetic fields, chromosphere, corona, waves, oscillations, loops, transients, beams, evaporation, NASA programs, Solar Optical Telescope, interior, convection, active regions, prominences, quiet radio Sun, instrumentation, and velocity fields.

105014 Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1 (15 July 1983).
Conference held at: Jerusalem, Israel. Date 6-8 June 1982. The following topics were dealt with: HgI_2 crystal growth and detector fabrication; HgI_2 detector characterisation and applications. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

105015 Proceedings of Symposium 2 of the COSPAR Twenty-Fourth Plenary Meeting.
Adv. Space Res. (GB), vol.3, no.4 (1983).
Conference held at: Ottawa, Canada. Date 16 May-2 June 1982. Sponsors: COSPAR; IAU. This symposium reviews the current observational status of gamma ray astronomy, emphasizing the objectives to be obtained by future instrumentation, and reviews the instruments currently being developed, as well as the future directions which new instrumentation might take. The four traditional domains of gamma ray astronomy gave rise to four sessions: (1) The first session was devoted to high energy gamma ray astronomy, with a review of the SAS 2 and COS B results on the diffuse galactic and extragalactic component, and on sources. It is clear that for the study of sources, future detectors must not only be more sensitive, but also have better resolution for localizing the emission. (2) The second session, on medium energy gamma ray astronomy, treated the observational results which, although scarce, are very interesting. One result of this session was the proposal to use coded aperture imaging to help identify the sources and associate them with objects known at other wavelengths. (3) The third session was on gamma ray spectroscopy. For studying the fine structure of energy spectra future instruments will still rely on the use of germanium detectors, whose performance and characteristics are improving continually. (4) The fourth session treated gamma ray bursts. 32 papers were presented which are published in full in the present proceedings.

105016 Biostereometrics '82.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.361 (1983).
Conference held at: San Diego, CA, USA. Date 24-27 Aug. 1982. The following topics were dealt with: stereometric data acquisition; photogrammetry and moire interferometry techniques; stereometric analysis and display; stereometric radiography; biomechanics including human locomotion; and the eye and the brain. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105017 10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3 (July-Sept. 1983).
Conference held at: Santa Fe, NM, USA. Date 25-27 Jan. 1983. The following topics were dealt with: Schottky barriers; heterojunctions; semiconductor surface studies and techniques; chemisorption and oxidation at semiconductor surfaces and interfaces. The main semiconductor materials studied are Si, Ge, GaAs, GaP, InP, GaAlAs and InGaAs. 72 papers were presented, of which 64 are published in full in the present proceedings, and 8 as abstracts only. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105018 Application of Nuclear Techniques in Geothermal Investigations Consultants Meeting.
Geothermics (GB), vol.12, no.2-3 (1983).
Conference held at: Vienna, Austria. Date 3-6 Nov. 1981. The papers presented at this conference describe how radioactive and nuclear techniques may be employed to study geothermal systems. Some of the papers describe the nuclear techniques and others describe studies of geothermal areas performed using the nuclear techniques. 15 papers are presented.

105019 Applied Radionuclide Metrology.
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8 (1983).
Conference held at: Geel, Belgium. Date 16-17 May 1983. The topics dealt with included: needs for radioactivity standards and measurement; multi-gamma-ray calibration sources; the variation of Ge-detector efficiency with source diameter and radial source position; the development of radioactive gas standards at IMRI; standardisation of ^{137}Cs; standardisation of ^{18}F for use in positron emission tomography; half-life measurements at the PTB; standardisation and decay rate of ^{169}Yb; the measurement of the beta-ray spectra of ^{90}Sr-^{90}Y; assay of radionuclide sources by energetic ion beams; a versatile solid-state detector spectrometer. 33 papers were presented, all of which are published in full in the present proceedings.

105020 Yamada Conference VI on Neutron Scattering in Condensed Matter.
Physica B & C (Netherlands), vol.120B+C, no.1-3 (May 1983).
Conference held at: Hakone, Japan. Date 1-4 Sept. 1982. The following topics were dealt with: pulsed neutron sources; neutron spin echo and spin modulation techniques; optical devices; neutron spectrometers; magnetic structure and magnetic excitations; spin density distributions; solitons; phase transitions; and lattice dynamics; nonperiodic and nonequilibrium systems; polymers and biological systems. 95 papers were presented, of which 85 are published in full in the present proceedings, and 8 as abstracts only. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105021 Institute of Statisticians International Conference on Practical Bayesian Statistics.
Statistician (GB), vol.32, no.1-2 (March-June 1983).
Conference held at: Cambridge, England. Date 21-24 July 1982. The following topics were dealt with: Bayesian statistics, theory, practice and applications to economics, medicine, education, insurance, law, industrial research, auditing, software engineering, road safety, inventory problems, advertising, system reliability, and hydrology. 39 papers were presented, of which 36 are

published in full in the present proceedings, and three as extended abstracts only. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

105022 11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s'.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1 (1983).
Conference held at: Scottsdale, AZ, USA. Date 1-3 Aug. 1983. The following topics were dealt with: training, research and test reactors; radioactive materials management; plant startup experiences; computer applications; personnel training; emergency planning; reactor operations; human factors. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

105023 1982 Meeting of the European Geophysical Society Symposium on Palaeomagnetism of Orogenic Belts.
Tectonophysics (Netherlands), vol.98, no.1-2 (1983).
Conference held at: Leeds, England. Date 1982. The following topics were dealt with: the rotation of both small and large scale tectonic blocks, the effects of strain and deformation on magnetization directions, the relationships between magnetic anisotropy and strain and how apparent polar wander can indicate relative continental movements.

105024 Surface Imaging and Analysis with High Spatial Resolution.
Ultramicroscopy (Netherlands), vol.11, no.2-3 (1983).
Conference held at: Wickenburg Inn, AZ, USA. Date 12-15 Jan. 1983. The following topics were dealt with: Si surface phase transitions studied by reflection electron microscopy; analysis of surface structural defects using LEED and RHEED; surface studies with supported metal particles and clusters; high energy transmission electron diffraction and imaging of Si surface structure; TEM imaging of atomic steps on ultrathin Au films; STEM imaging and analysis of surfaces; surface reactions and excitations; UHV-SEM studies of surface processes; surface imaging by scanning tunnelling microscopy; unstained DNA on a metal substrate; reflection electron microscopy of vicinal surfaces of FCC metals; surface step height measurement by STEM low-loss imaging; surface excitations and EELS; electron- and photon-stimulated desorption; work function measurements; photoelectron emission microscopy; and glancing reflection EELS from bulk crystals. 17 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105025 Otto-Schott-Colloquium on the State of Optical Glass Research 1982.
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.2-3 (1983).
Conference held at: Jena, Germany. Date 1982. The following topics were dealt with: influence of elementary structure defects on the optical properties of glasses; gradient index optical materials; recent advances in optical fibre materials; oxide and halide laser glasses; glass-forming in ternary telluride systems; reacting and optical properties of silicate glass surfaces; solid electrolyte batteries and fast ion conducting glasses; fundamental models of electronic transport in amorphous semiconductors; diffusion processes in glasses and glass melts; crystallisation behaviour of rapidly quenched iron oxide containing glasses with regard to thermal and magnetic properties; relaxation properties in inorganic glasses; NMR studies of structure and ion motion in glasses; structure and intrinsic disorder of glassforming compounds; structure of one phase glasses and melts; crack resistance a sensitive parameter for characterisation of the mechanical strength of glasses in the surface region; phase separation and crystallisation of zirconium and titanium containing lithium-aluminosilicate glasses; structure-property relations of optical glasses with abnormal partial dispersion; development of optical fluorophosphate glasses; bioactive implantates based on glass ceramic materials and machinable bioactive glass-ceramics. 29 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105026 Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings.
Geneva, Switzerland: CERN (1983), xi+584 pp.
Conference held at: Rome, Italy. Date 12-14 Jan. 1983. Sponsors: Istituto Nazionale di Fisica Nucl.; Univ. Rome. The following topics were dealt with: CERN collider with minimum bias trigger; search for fractionally charged relativistic particles at CERN $\bar{p}p$ collider; UA5 results; multiplicity correlations in $\bar{p}p$; hadron jets and large transverse momentum electrons at SPS; elastic and total cross sections; small angle pp and $\bar{p}p$ elastic scattering; fermilab $p\bar{p}$ collider; QCD in $p\bar{p}$ collider physics; hadron versus e^+e^- colliders; intermediate vector boson parameters; very heavy flavours; transverse energy production; QCD radiation; weak interactions in the fermi scale region; limitations in usable collider luminosity. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105027 Planetary Nebulae. International Astronomical Union Symposium No.103.
Dordrecht, Netherlands: Reidel (1983), xxi+557 pp. [90 277 1558 0]
Conference held at: London, England. Date 9-13 Aug. 1982. Discusses planetary nebulae observations, kinematics, morphology, bipolar nebulae, NGC 2346, radio observations, IR emission lines, molecules, dust, UV, atomic parameters, ionisation equilibrium, plasma, recombination, radiative transfer, spectra, abundances, S, red giants, evolution, long period variable stars, mass loss, winds, symbiotic star, model atmosphere, Magellanic Clouds, HR diagram, distances, metallicity and mass.

105028 Heavy-Ion Collisions. Proceedings of the International Summer School.
Berlin, Germany: Springer-Verlag (1982), vi+429 pp. [3 540 11945 0]
Conference held at: La Rabida, Spain. Date 7-18 June 1982. The following topics were dealt with: heavy ion collisions; effective interactions; potential model descriptions; folding models; elastic scattering; inelastic scattering; polarisation; transfer reactions; charge and matter distributions; selfconsistent models; dissipative collisions; deep inelastic peripheral collisions; fission; preequilibrium processes; nuclear far from stability; proton decay; high spin states; nuclear shape; moment of inertia; fusion; compound nuclei; nuclear molecular states; quasimolecules; quasiatoms. 24 papers were presented, of which 23 are published in full in the present proceedings, and 1 as abstract only. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105029 Internal Kinematics and Dynamics of Galaxies. International Astronomical Union Symposium No.100.
Dordrecht, Netherlands: Reidel (1983), xvi+432 pp. [90 277 1547 5]
Conference held at: Besancon, France. Date 9-13 Aug. 1982. Discusses H II rotation curves, H I velocity fields, TAURUS, spectrometer, galaxy, molecular clouds, CO, Milky Way, galactic nuclei, mass model, warp, disc thickness, dark haloes, missing mass, spiral structure, instabilities, disc heating, star formation, cloud-particle dynamics, ballistic particle model, bubbles, angular momentum, shocks, corotation, Virgo cluster, magnetic fields, density waves, periodic orbits, stellar kinematics, dynamics, stochasticity, gas flow, bar forcing, hydrodynamics, rings, lenses, bulges, interstellar matter, gaseous emission, radiogalaxies, mergers, velocity field, shells, collisions, tidal encounters, globular clusters, Hubble type and superclusters.

105030 Highlights of Astronomy as Presented at the XVIII General Assembly of the IAU. Vol.6.
Dordrecht, Netherlands: Reidel (1983), viii+817 pp. [90 277 1565 3]
Conference held at: Patras, Greece. Date 17-26 Aug. 1982. Discusses ancient Greek astronomy, Sun and planetary system origin and early history, stellar evolution, cosmology, solar flares, solar luminosity variations, stellar populations, globular cluster abundances, ages, halo field star composition, spiral galaxies nuclei, elliptical galaxies, star formation, Hubble type, distance scale, Magellanic Clouds, Cepheids, Virgo Cluster, Universe, Tully-Fisher relation, Hubble constant, comets, ices, grains, Oort cloud, asteroids, meteorite, meteors, zodiacal light, dust, Saturn, active galactic nuclei, X-ray source, mass loss, stellar wind, interstellar matter, novae, supernovae, quasars, H II regions, X-ray binaries, close binaries, background radiation, molecular clouds, beams, jets, supercluster, stellar spectra and plasma.

105031 Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute.
New York, USA: Plenum (1983), xi+538 pp. [0 306 41105 9]
Conference held at: Baddeck, NS, Canada. Date 13-26 Sept. 1981. The following topics in collision processes were dealt with: electron-impact excitation of ions; electron-impact ionisation of ions; electron-ion recombination; ion-ion charge exchange; ion confinement; ion-ion recombination; dissociative recombination. The relevance of the work to laboratory plasmas, astrophysics and thermonuclear fusion is also discussed. 12 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105032 Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191).
Paris, France: ESA (1983), viii+440 pp.
Conference held at: Madrid, Spain. Date 5-8 April 1983. Sponsors: ESA; UPM; ELGRA; COSPAR. The following topics were dealt with: fluid physics under reduced gravity; composites and heterogeneous phases; experimental facilities and programmes; transport phenomena; combustion; gas/liquid interfaces; liquid/solid interfaces and critical-point phenomena. 66 papers were presented, of which 54 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

105033 Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium.
Paris, France: ESA (1983), xiv+493 pp.
Conference held at: Louvain-la-Neuve, Belgium. Date 9-15 June 1983. Sponsors: ESA; CEC. The following topics were dealt with: clear air refractivity and turbulence, rain and dust characteristics, attenuation and crosspolarisation of microwaves, radar and radiometer measurements, surface and volume scattering, multipath effects, applications to remote sensing and inversion methods. 64 papers were presented, all of which are published in full in the present proceedings.

105034 Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School.
Amsterdam, Netherlands: North-Holland (1983), xxv+510 pp. [0 444 86560 8]
Conference held at: France. Date 2-21 June 1982. Discusses gravitational radiation theory, the motion of compact bodies, positivity of total gravitational energy at retarded times, initial value problems and dynamics, numerical relativity, sources, extragalactic origins, interferometric detectors, resonant bar detectors, Weber-type gravitational antennae, asymptotically flat empty spaces, motion equations, gauge conditions, rotating stars general relativistic collapse, low temperature wave detector, optical detectors, EM tracked free mass antennas and linear models for detector analysis.

105035 Proceedings 1983 International Symposium on Urban Hydrology, Hydraulics and Sediment Control.
Lexington, KY, USA: OES Publications (1983), 531 pp. [0 89779 056 1]
Conference held at: Lexington, KY, USA. Date 25-28 July 1983. Sponsors: Univ. Kentucky; Coll. Engng; et al. The following topics were dealt with: hydrology; stormwater management—planning and analysis; stormwater quality; water distribution systems; hydraulics of sewers; flood plain considerations; erosion and sediment transport; detention facilities; and economic, legal and institutional aspects. 58 papers were presented, all of which are published in full in the present proceedings.

105036 Third Joint Conference on Applications of Air Pollution Meteorology.
Boston, MA, USA: American Meteorological Soc. (1983), 311 pp.
Conference held at: San Antonio, TX, USA. Date 12-15 Jan. 1982. Sponsors: American Meteorological Soc.; Air Pollution Control Assoc. The following topics were dealt with: ozone and long-range transport; long-range transport and photochemistry; acid rain and visibility; source and input data; regulatory aspects; new model development; accident and emergency applications; remote sensing and instrumentation; complex terrain; power plants; major studies; RAPS and physical modelling; model comparisons; and model evaluation. All papers were presented as abstracts only.

105037 Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V.
Amsterdam, Netherlands: North-Holland (1982), xx+991 pp. [0 444 86529 2]
Conference held at: Kyoto, Japan. Date 16-20 Nov. 1981. The following topics were dealt with: advances in techniques; electronic theory of atomic defects; self-interstitials; interstitials and vacancies solutes in metals, point defect solute interactions diffusion; high-concentration alloys; defect clusters; interaction with dislocation and grain bonding; radiation damage. Abstracts of individual papers can be found under relevant classification codes in this or future issues.

01.30E Monographs, and collections

105038 Basaltic volcanism on the terrestrial planets. W.M.Kaula, J.W.Head,III, R.B.Merrill, R.O.Pepin, S.C.Solomon, D.Walker, C.A.Wood [Ed.]
New York, USA: Pergamon (1981), 1286 pp.
Discusses terrestrial planets basaltic volcanism, petrology, chemistry, meteorites, lunar rock, tectonics, isotope analysis, radiometric chronology, cratering, thermal histories, planetary bodies evolution.

105039 Constrained dynamics with applications to Yang-Mills theory, general relativity, classical spin, dual string model. K.Sundermeyer.
Berlin, Germany: Springer-Verlag (1982), iv+318 pp. [3 540 11947 7]
The author considers constrained dynamic systems with applications to Yang-Mills theory, general relativity, classical spin, and the dual string model.

01.30K Handbooks, dictionaries, tables and data compilation

105040 Tables of Auger transition amplitudes. I.Chorkendorff (Fysisk Inst., Odense Univ., Odense, Denmark).
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.1, p.1-57 (Aug. 1983).
A short review of the theory of the Auger transition in a mixed coupling scheme is given, and an expression for the transition probability in terms of transition amplitudes has been derived. The amplitudes for all Auger transitions in systems with initially filled shells have been calculated and are tabulated in terms of D and E radial integrals. (27 refs.)

105041 The solubility of oxygen and ozone in liquids. R.Battino, T.R.Rettich, T.Tominaga (Dept. of Chem., Wright State Univ., Dayton, OH, USA).
J. Phys. & Chem. Ref. Data (USA), vol.12, no.2, p.163-78 (1983).
Reviews the solubility of oxygen and ozone in liquids as a function of temperature and pressure. Solubility data for individual systems were critically evaluated and recommended or tentative values presented in many cases. The trend of solubilities in homologous series or related solvents is discussed. Liquids include water; seawater; aqueous salt solutions; mixed solvents; hydrocarbons; organic compounds containing oxygen, halogen, sulfur, nitrogen, or silicon; olive oil; and human blood. For ozone, only its solubility in water is presented. (106 refs.)

105042 Recommended values for the thermal expansivity of silicon from 0 to 1000K. C.A.Swenson (Dept. of Phys., Iowa State Univ., Ames, IA, USA).
J. Phys. & Chem. Ref. Data (USA), vol.12, no.2, p.179-82 (1983).
Silicon, a high melting point, low expansivity, cubic material which can be obtained readily in high purity form, provides an excellent thermal expansion standard. Various absolute determinations of the thermal expansivity of both single crystal and polycrystalline silicon are used to establish a smooth relationship from 90 to 850K which is believed to be reliable to roughly $10^{-8}K^{-1}$, and which is extrapolated to 1000K. Values also are suggested for temperatures to absolute zero. (18 refs.)

105043 Electrical resistivity of ten selected binary alloy systems. C.Y.Ho, M.W.Ackerman, K.Y.Wu, T.N.Havill, R.H.Bogaard, R.A.Matula, S.G.Oh, H.M.James (Center for Information & Numerical Data Analysis & Synthesis, Purdue Univ., West Lafayette, IN, USA).
J. Phys. & Chem. Ref. Data (USA), vol.12, no.2, p.183-322 (1983).
Compiles, reviews, and discusses the available data and information on the electrical resistivity of ten selected binary alloy systems and presents the recommended values resulting from critical evaluation, correlation, analysis, and synthesis of the available data and information. The ten binary alloy systems selected are the systems of aluminum-copper, aluminum-magnesium, copper-gold, copper-nickel, copper-palladium, copper-zinc, gold-palladium, gold-silver, iron-nickel, and silver-palladium. The recommended values of each of the ten binary alloy systems except three (aluminum-copper, aluminum-magnesium, and copper-zinc) are given for 27 compositions: 0 (pure element), 0.5, 1.3, 5, 10(5)95, 97, 99, 99.5, and 100% (pure element). For aluminum-copper, aluminum-magnesium, and copper-zinc alloy systems, the recommended values are given for 26, 12, and 11 compositions, respectively. For most of the alloy systems the recommended values cover the temperature range from 1K to the solidus temperature of the alloys or to about 1200K. For most of the nine elements constituting the alloy systems, the recommended values cover the temperature range from 1K to above the melting point into the molten state. The estimated uncertainties in most of the recommended values are about $\pm 3\%$ to $\pm 5\%$. (408 refs.)

105044 Energy levels of silicon, Si I through Si XIV. W.C.Martin, R.Zalubas (Center for Radiation Res., Nat. Measurement Lab., NBS, Washington, DC, USA).
J. Phys. & Chem. Ref. Data (USA), vol.12, no.2, p.323-80 (1983).
Energy level data are given for the atom and all positive ions of silicon ($Z=14$). These data have been critically compiled, mainly from published material on measurements and analyses of the optical spectra. The authors have derived or recalculated the levels for a number of the ions. In addition to the level value in cm^{-1} and the parity, the J value and the configuration and term assignments are listed if known. Leading percentages from the calculated eigenvectors are tabulated or quoted wherever available. Ionization energies are given for all spectra. (6 refs.)

105045 Evaluation of binary PTxy vapor-liquid equilibrium data for C_6 hydrocarbons. Benzene+hexane. B.D.Smith, O.Muthu, A.Dewan (Thermodynamics Res. Lab., Washington Univ., St. Louis, MO, USA).
J. Phys. & Chem. Ref. Data (USA), vol.12, no.2, p.381-7 (1983).
The binary *PTxy* vapor-liquid equilibrium data for the benzene+hexane system are evaluated. The needs for new experimental data are defined. (5 refs.)

105046 Evaluation of binary excess enthalpy data for C_6 hydrocarbons. Benzene+hexane. B.D.Smith, O.Muthu, A.Dewan (Thermodynamics Res. Lab., Washington Univ., St. Louis, MO, USA).
J. Phys. & Chem. Ref. Data (USA), vol.12, no.2, p.389-93 (1983).
The excess enthalpy data for the benzene+hexane system are evaluated. The needs for new experimental data are defined. (3 refs.)

105047 Evaluation of binary excess volume data for C_6 hydrocarbons. Benzene+hexane. B.D.Smith, O.Muthu, A.Dewan (Thermodynamics Res. Lab., Washington Univ., St. Louis, MO, USA).
J. Phys. & Chem. Ref. Data (USA), vol.12, no.2, p.395-401 (1983).
The excess volume data for the benzene+hexane system are evaluated. The needs for new experimental data are defined. (4 refs.)

105048 PHAB—an alloy phase diagram bibliographic database: a part of the ASM/NBS data program for alloy phase diagrams. J.R.Cuthill, H.Baker (American Soc. for Metals, Metals Park, OH, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.429-32
PHAB is intended to be a complete bibliographic file of the phase diagram data papers pertaining to the experimental determination, evaluation and calculation of phase diagrams of binary, ternary and higher-order alloy systems. Metastable as well as stable equilibrium data, crystal structure, thermodynamic and high pressure data are included. The database will provide a service to the scientific community as well as serving the ASM/NBS data program for alloy phase diagrams. The PHAB database will serve as a source of data to the other activities and outputs of the program, including alloy system evaluations, the bulletin of alloy phase diagrams and bound volumes of evaluated phase diagrams, as well as other databases. (3 refs.)

01.30M Textbooks for graduates and researchers

105049 Vibrational spectra and structure. A series of advances. Vol.12. J.R.Durig [Ed.]
Amsterdam, Netherlands: Elsevier (1983), xvi+497 pp. [0 444 42197 1]
The author presents papers on: infrared studies of site structure and dynamics of matrix isolated molecules; force fields for large molecules; molecular electronic excited state structure by resonance Raman spectroscopy; vibrational spectra and conformational analysis of three membered ring compounds; vibrational spectra of small matrix isolated molecules; Raman difference spectroscopy.

105050 Atmosphere-ocean dynamics. A.E.Gill.
New York, USA: Academic Press (1982), 662 pp.
The following topics are dealt with: the input of energy from the Sun and the subsequent redistribution of heat by the atmosphere and ocean, the interchanges of properties (mass, heat, and momentum) between atmosphere and ocean, the thermodynamics and motion equations of ocean and atmosphere, gravity waves in non-rotating systems and gravity wave adjustment to geostrophic steady flows in rotating systems, tropical motions, mid-latitude meteorology and oceanography, barotropic and baroclinic instability processes, fronts in the atmosphere and ocean, and the atmospheric general circulation. Appendices list units, constants, properties of moist air and sea water, and atlases and other data sources. (>1500 refs.).

105051 Elastic media with microstructure I. One-dimensional models. I.A.Kunin.
Berlin, Germany: Springer-Verlag (1982), viii+291 pp. [0 387 11145 x]
Crystals and polycrystals, composites and polymers, grids and multibar systems can be considered as examples of media with microstructure. A characteristic feature of all such models is the existence of scale parameters which are connected with microgeometry or long-range interacting forces. As a result the corresponding theory must essentially be a nonlocal one. The book is devoted to a systematic investigation of effects of microstructure, inner degrees of freedom and nonlocality in elastic media. The propagation of linear and nonlinear waves in dispersive media, static problems, and the theory of defects are considered in detail. Much attention is paid to approximate models and limiting transitions to classical elasticity.

01.30P Textbooks for undergraduates

105052 Fundamentals of molecular spectroscopy. Third edition. C.N.Banwell.
Maidenhead, Berks., England: McGraw-Hill (1983), xii+338 pp. [0 07 084139 X]
The author discusses the basic theory of spectroscopy and the elements of practical spectroscopy, including Fourier transform spectroscopy, signal to noise ratios and resolving power, spectrum enhancement and computer averaging, stimulated emission and lasing. He describes microwave, infrared and Raman spectroscopy, electronic spectroscopy of atoms and molecules, electron and nuclear spin resonance spectroscopy and Mossbauer spectroscopy. (12 refs.)

105053 Thunderstorms: A social scientific and technological documentary. Vol. 2. Thunderstorm morphology and dynamics. E.Kessler [Ed.]
Washington, DC, USA: U.S. Government Printing Office (1982), 603 pp.
Discusses thunderstorm morphology and dynamics, cumulus convection, climatology, weather modification, energetics, gust fronts, tornadoes, hail, electrical phenomena, mesoscale processes and sea thunderstorms.

105054 Geoelectromagnetic investigation of the Earth's crust and mantle. I.I.Rokityansky.
Berlin, Germany: Springer-Verlag (1982), xiii+381 pp. [3 540 10630 8]
Discusses geoelectromagnetic fields, elements of the theory of electromagnetic fields, the inverse problem, global and regional geomagnetic deep sounding, magnetotelluric sounding, magnetic variation profiling (MVP), electrical conductivity anomalies, geomagnetic observatories of world-wide network.

01.30R Surveys and tutorial papers; resource letters

105055 Hydromagnetic waves in the magnetosphere. W.J.Hughes (Dept. of Astron., Boston Univ., Boston, MA, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.2, p.508-20 (March 1983).
The review is divided into three main sections, dealing in turn with waves at or around the ion gyrofrequency, waves with frequencies much below the ion gyrofrequency and waves associated with magnetospheric substorms. The author concludes with two smaller sections, one describing attempts to artificially generate hydromagnetic waves (or the inadvertent generation or stimulation by man) and the other on the recent application of data analysis techniques which may well have a large impact on the field. The review covers a wide subject in which over 300 papers have been published during the 1979-82 period. (338 refs.)

01.30T Bibliographies

105056 Fuel cycles: A bibliography of AECL publications.
Report AECL-6425 Rev.1, Atomic Energy Canada Ltd., Chalk River, Ont. (May 1983), 32 pp.
AECL publications, from the open literature, on fuels and fuel cycles used in CANDU reactors are listed in this bibliography. The accompanying index is by subject.

01.40 EDUCATION

105057 Biomedical engineering training in Dundee. S.Hughes (School of Biomedical Engng., Univ. of Dundee, Dundee, Scotland).
Eng. Med. (GB), vol.12, no.3, p.145-7 (July 1983).
A brief outline of the activities and supporting departments involved in biomedical engineering is presented together with a description of existing and potential training facilities. (no refs.)

105058 Education in bioengineering: experience at the University of Leeds. V.Wright, D.Dowson (Univ. of Leeds, Leeds, England).
Eng. Med. (GB), vol.12, no.3, p.151-3 (July 1983).
At the University of Leeds, bioengineering has developed mainly as a postgraduate discipline, but undergraduate students are given a taste of the subject both in formal teaching and in final year projects. The multi-disciplinary field of biomedical engineering has a substantial appeal to graduates in engineering and science. The University of Leeds has responded to the position through the provision of undergraduate courses in bioengineering in both the mechanical engineering and mechanical schemes of study, short courses of both introductory and specialist nature, laboratory facilities and opportunities for postgraduate research in several aspects of the subject, the formation of an informal Bioengineering Group for the Study of Human Joints in 1966,

and the creation of a University Centre for Studies in Medical Engineering in 1971. (18 refs.)

105059 Medical biophysics in Manchester. B.R.Pullan, J.A.Chapman, A.R.Williams, C.J.Taylor, D.W.L.Hukins, H.Sharma (Dept. of Medical Biophys., Univ. of Manchester, Manchester, England).
Eng. Med. (GB), vol.12, no.3, p.155-6 (July 1983).
The Department of Medical Biophysics in the University of Manchester provides research training in the application of physical and engineering sciences to biomedical problems. A wide range of projects is available for students who wish to work for MSc and PhD degrees. (11 refs.)

105060 The masters degree in bioengineering at the University of Strathclyde. J.P.Paul (Bioengng. Unit, Univ. of Strathclyde, Glasgow, Scotland).
Eng. Med. (GB), vol.12, no.3, p.157-61 (July 1983).
Discusses a number of matters relating to University courses in Bioengineering at MSc level. The experience at the University of Strathclyde over the past twenty years is reviewed with regard to entrants and their qualifications, material presented and employment prospects. (no refs.)

105061 The Microelectronics Education Programme (MEP) the half-term report (1981-82). J.S.A.Anderson.
Wescon/82 Conference Record, Anaheim, CA, USA, 14-16 Sept. 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.13-1/1-8
The report covers the 'half-term' of the UK national government initiative to stimulate microelectronics education in British schools in England, Wales and Northern Ireland. Originally announced on 4 March 1980 by the Minister of State at the national government's Department of Education and Science (DES), it was intended to run for four years at £9 million sterling. The overall aim of the Programme is to help schools to prepare children for life in a society in which devices and systems based on microelectronics are commonplace and pervasive. In May 1982 the Programme had established a plateau of achievement and provided a sound foundation for further innovation and dissemination. The Programme is under active consideration for immediate extension to 1985 and beyond. (4 refs.)

105062 The BBC Computer Literacy Project. R.Salkeld (BBC, Leeds, England).
Wescon/82 Conference Record, Anaheim, CA, USA, 14-16 Sept. 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.13-3/1-4
The author discusses the BBC Computer Literacy Project. This was launched on 11th January 1982 with the first public screening of 'The Computer Programme'—a ten part television series produced by the BBC's Continuing Education Television Department and designed to provide a beginner's guide to computers and computing. These ten programmes form the central core of the project providing an easily available introduction from which anyone, regardless of their previous knowledge, can begin to gain some insight into computers and their applications. But the project is multi-layered, offering the interested viewer opportunities to become very much more involved with computers and computing than simply watching a few hours of television. A key note of the whole project is what has come to be known as 'hands-on experience', the opportunity to learn about computers by actually operating one yourself. (no refs.)

01.50 EDUCATIONAL AIDS

105063 In vino veritas: a study of wineglass acoustics. A.P.French (Phys. Dept., MIT, Cambridge, MA, USA).
Am. J. Phys. (USA), vol.51, no.8, p.688-94 (Aug. 1983).
Describes an investigation of the natural resonant frequencies of vessels such as wineglasses. Measurements on a number of glasses are interpreted with the help of theoretical predictions based on the analysis of vibrating systems by means of the energy method. Results and analysis are given for empty glasses and for glasses containing different amounts of liquid. Evidence for vibrational modes above the lowest is presented. (6 refs.)

105064 An electrostatic example to illustrate dimensional regularization and renormalization group technique. M.Hans (Phys. Theorique et Math., Univ. de Liege, Liege, Belgium).
Am. J. Phys. (USA), vol.51, no.8, p.694-8 (Aug. 1983).
An easy and intuitive introduction to the regularization and renormalization techniques in elementary particle physics is given. It is based on the use of a simple electrostatic problem. (19 refs.)

105065 Photon mass experiment. R.E.Crandall (Dept. of Phys., Reed Coll., Portland, OR, USA).
Am. J. Phys. (USA), vol.51, no.8, p.698-702 (Aug. 1983).
A Coulomb null experiment is described that enables physics students to obtain rigorous upper bounds on photon mass. The experimenter searches for subnanovolt signals that would escape a closed shell were photon mass to be positive. The approach can be adapted for several college levels. At the simplest level, a 'miniature' low-cost experiment allows a student to verify the exponent '-2' in Coulomb's law to eight or more decimal places. An advanced student given a full-size apparatus (at greater cost) can obtain mass bounds very close to the established laboratory limit. (13 refs.)

105066 Exactly solvable three-dimensional scattering problem. C.Eftimiu (McDonnell Douglas Res. Labs., St. Louis, MO, USA).
Am. J. Phys. (USA), vol.51, no.8, p.709-11 (Aug. 1983).
Schrodinger's equation is solved exactly for a potential vanishing outside a prolate spheroid. The potential is then reconstructed from the first Born approximation for the scattering amplitude. (5 refs.)

105067 Universal variables in the two-body problem. E.Everhart (Phys. Dept., Univ. of Denver, Denver, CO, USA), E.T.Pitkin.
Am. J. Phys. (USA), vol.51, no.8, p.712-17 (Aug. 1983).
Universal variables offer a considerable improvement on classical methods of solving the two body problem. The method has the same structure regardless of whether the orbit is an ellipse, parabola, or hyperbola. The near-parabolic orbit is handled with ease. Universal variables are particularly useful when starting with a position-velocity vector at time zero and finding this vector at any other time. This paper is tutorial, written in the belief that this method should be better known. A laboratory exercise is described which uses universal variables in plotting orbits in the Solar System. The Appendix contains a concise derivation of the equations for universal variables. (23 refs.)

105068 Center-of-mass properties of composite systems subject to nonlinear external interactions. J.A.Lock (Dept. of Phys., Cleveland State Univ., Cleveland, OH, USA).
Am. J. Phys. (USA), vol.51, no.8, p.717-21 (Aug. 1983).
If two bound nonrelativistic quantum particles are each subject to a nonlinear external potential, their Schrodinger equation does not separate in relative and center-of-mass coordinates. For this case, the details of internal state of the composite affect its center-of-mass properties. The extent of this internal state influence is examined for an exactly soluble one-dimensional model system. (8 refs.)

105069 The simple pendulum in a rotating frame. A.-M.M.Abdel-Rahman (Dept. of Phys., Faculty of Sci., King Saud Univ., Riyadh, Saudi Arabia).
Am. J. Phys. (USA), vol.51, no.8, p.721-4 (Aug. 1983).
The classical, semiclassical, and quantum aspects of the motion of a simple pendulum rotating in the direction perpendicular to its plane of oscillations and having negative total energy in its rotating frame are considered. The system is studied for angular velocities that barely exceed the value at which spontaneous symmetry breaking sets in, as well as for angular velocities away from this value. In the former case the semiclassical methods give the energy levels and in the latter they indicate that the quantum effects manifest themselves when the velocity of rotation is very high. The solutions of the Schrodinger equation in this limit are discussed and it is noted, in contrast to the plane pendulum system, that both odd- and even-order periodic Mathieu functions are admissible eigenfunctions. (10 refs.)

105070 The photoelectric determination of h/e: a new approach to an old problem. A.W.Knudsen (Phys. Dept., Univ. of Calgary, Calgary, Alberta, Canada).
Am. J. Phys. (USA), vol.51, no.8, p.725-9 (Aug. 1983).
A method is described for the photoelectric determination of h/e, based on Fowler's classic theory of the frequency-dependent photoelectric yield. In this method, the geometrical arrangement of the electrodes in the h/e phototube is found to be of fundamental importance, and great care was taken to ensure that plane-parallel geometry was maintained. This method, which provides a value of h/e to within $^2/_3$% of the accepted value, is objective and accurate and is considered to be a very suitable experiment for an advanced undergraduate physics laboratory. (13 refs.)

105071 Quantum theory of an electron in external fields using unitary transformations. R.M.O.Galvao, L.C.M.Miranda (Centro Tecnico Aerospacial, Inst. de Estudos Avancados, Sao Paulo, Brazil).
Am. J. Phys. (USA), vol.51, no.8, p.729-33 (Aug. 1983).
The technique of using unitary transformations to solve quantum-mechanical problems involving nontrivial time-dependent Hamiltonians is discussed. After introducing the basic ideas in simple examples, the technique is used to solve the problem of an electron in crossed magnetic and electric static fields plus laser (plane wave) field. (5 refs.)

105072 Le Chatelier reciprocal relations and the mechanical analog. R.Gilmore (Dept. of Phys. & Atmospheric Sci., Drexel Univ., Philadelphia, PA, USA).
Am. J. Phys. (USA), vol.51, no.8, p.733-43 (Aug. 1983).
Le Chatelier's principle is discussed carefully in terms of two sets of simple thermodynamic examples. The principle is then formulated quantitatively for general thermodynamic systems. The formulation is in terms of a perturbation-response matrix, the Le Chatelier matrix $[L]$. Le Chatelier's principle is contained in the diagonal elements of this matrix, all of which exceed one. These matrix elements describe the response of a system to a perturbation of either its extensive or intensive variables. These response ratios are inverses of each other. The Le Chatelier matrix is symmetric, so that a new set of thermodynamic reciprocal relations is derived. This quantitative formulation is illustrated by a single simple example which includes the original examples and shows the reciprocities among them. The assumptions underlying this new quantitative formulation of Le Chatelier's principle are general and applicable to a wide variety of nonthermodynamic systems. Le Chatelier's principle is formulated quantitatively for mechanical systems in static equilibrium, and mechanical examples of this formulation are given. (10 refs.)

105073 APL and the numerical solution of high-order linear differential equations. N.A.Gershenfeld (Bell Labs., Murray Hill, NJ, USA), E.H.Schadler, O.M.Bilaniuk.
Am. J. Phys. (USA), vol.51, no.8, p.743-6 (Aug. 1983).
An Nth-order linear ordinary differential equation is rewritten as a first-order equation in an $N \times N$ matrix. Taking advantage of the matrix manipulation strength of the APL language this equation is then solved directly, yielding a great simplification over the standard procedure of solving N coupled first-order scalar equations. This eases programming and results in a more intuitive algorithm. Example applications of a program using the technique are given from quantum mechanics and control theory. (12 refs.)

105074 Solar escape. A.Z.Handel (Dept. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).
Am. J. Phys. (USA), vol.51, no.8, p.746-8 (Aug. 1983).
If one tries to calculate the minimum velocity a spaceship needs to escape from the solar gravitational field one is likely to get a wrong answer. The author illustrates the difficulties with several examples and gives a simple method to solve a certain class of problems. (1 ref.)

105075 Astronautical velocities. A.Diaz-Jimenez (Investigador Cientifico, Bogota, Colombia).
Am. J. Phys. (USA), vol.51, no.8, p.749 (Aug. 1983).
A space vehicle moving in a circular orbit or radius r_1 transfers to a circular orbit of radius r_2 by means of a elliptical path between A and B. This transfer path is known as the Hohman transfer ellipse. The author considers the problem of getting from Earth [orbital speed $V_{c1} = (GM_s/R_{es})^{1/2} = 29.8$ km/s] to the planet B [orbital speed $V_{c2} = (GM_s/R_{Bs})^{1/2}$]. He uses the good approximation that the orbits of the planets are circles with the sun at their common center. (6 refs.)

105076 Space-time symmetries and photon selection rules. G.E.Stedman (Dept. of Phys., Univ. of Canterbury, Christchurch, New Zealand).
Am. J. Phys. (USA), vol.51, no.8, p.750-5 (Aug. 1983).
The effects of time and space inversion, and also spatial rotation, on photons and their interaction with matter are discussed. Simple analyses are given for spinorial sign reversal effects and for various selection rules on the interaction with matter. Several rules require for their interpretation a judicious combination of arguments from spatial and temporal symmetry operations. (55 refs.)

105077 Instructional laboratory experiment on the sound field of a small ultrasonic transducer. I.Kinyuy, F.B.Stumpf (Phys. Dept., Ohio Univ., Athens, OH, USA).
Am. J. Phys. (USA), vol.51, no.8, p.756-7 (Aug. 1983).
The directivity pattern and the axial-pressure profile were measured for a small ultrasonic transducer. This is a useful basic experiment for an undergraduate course in sound or musical acoustics. (5 refs.)

105078 Fixed points in torque-angular momentum relations. G.Faucher (Dept. of Engng. Phys., Ecole Polytech., Montreal, Canada).
Am. J. Phys. (USA), vol.51, no.8, p.758-9 (Aug. 1983).
The use of relation $\tau_A = \dot{\mathbf{L}}_A$, where τ_A is the resultant torque of the external forces applied on a body and $\mathbf{L}_A$ is the resultant angular momentum, is straightforward when both quantities refer to a fixed point A. However, these quantities are often referred to a point which is not fixed; though incorrect in general, the relation is valid in many cases. Generally students do not under-

stand under what conditions the relation is valid. The author derives the general expression and states the conditions under which it can be reduced to the simpler form given above. (10 refs.)

105079 A linkage for representing sine, cosine, and the reference circle. R.D.Ayers (Dept. of Phys. Astron., California State Univ., Long Beach, CA, USA).
Am. J. Phys. (USA), vol.51, no.8, p.760-1 (Aug. 1983).
The resolution of the complex exponential $e^{i\theta}$ into its real and imaginary parts is demonstrated dynamically with a simple linkage. This model also illustrates how those real and imaginary parts are composed from linear combinations of $e^{i\theta}$ and $e^{-i\theta}$. A 12-in-diam., version has proved large enough for classroom demonstrations and sturdy enough for use in a hands-on museum. (no refs.)

105080 Radioactive half-life measurements in a freshman or sophomore laboratory. F.W.Supon, J.J.Kraushaar (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).
Am. J. Phys. (USA), vol.51, no.8, p.761-3 (Aug. 1983).
Elementary modern physics laboratories frequently include an experiment on the measurement of a radioactive half-life. While a number of possible experiments can be designed, there are usually the constraints that the half-life involved be measurable in the two- or three-hour laboratory period and that the students are exposed to a minimum of radiation. Because it was felt desirable to have the students become acquainted with electronic counting devices, random counting statistics and modern detectors, a new type of experiment has been designed that is not being used successfully. The alpha detector is patterned after the detectors used by the US Bureau of Mines for monitoring randon. (3 refs.)

105081 A microcomputer air-track timer. J.B.Rafert, R.C.Nicklin (Dept. of Phys. Astron., Appalachian State Univ., Boone, NC, USA).
Am. J. Phys. (USA), vol.51, no.8, p.763-4 (Aug. 1983).
The authors have used a microcomputer equipped with an analog to digital converter (ADC) to measure times as air-track gliders pass a pair of photodetectors. This has produced a versatile timing instrument which allows measurements as good as any reported in the air-track literature. The cost is reasonable if a microcomputer is already available. (12 refs.)

105082 Some experiments in partially coherent imaging and modulation transfer function evaluation. G.Indebetouw (Dept. of Phys., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Appl. Phys. B (Germany), vol.B32, no.1, p.21-4 (Sept. 1983).
A relatively simple and inexpensive scanning optical system is described as a versatile tool for the demonstration and analysis of a variety of optical imaging properties. Some examples of partially coherent imaging and modulation transfer function (MTF) evaluation are presented. (8 refs.)

105083 Audiovisual environments and equipment standards for education. A.J.Powell (McGill Univ., Montreal, Canada).
SMPTE J. (USA), vol.92, no.7, p.735-8 (July 1983).
Using the proposed Engineering Committee Recommendations ECR 3, Standards for Conference Facilities, as a starting point, the paper traces the design relationships between the architectural and projection parameters of learning spaces for front projection within the topic of audio-visual environments. The two sets of parameters are combined to illustrate professional techniques used in reaching optimum image dimensions for the learning spaces. The effects on projection equipment performance are shown. The design process is reviewed as involving the necessary application of three distinct standards. Further research into the subject is proposed, to develop a media facilities specification standard for the construction industry. (11 refs.)

01.60 BIOGRAPHICAL, HISTORICAL, AND PERSONAL NOTES

105084 Photography and the long-focus visual refractor: three American case studies, 1885-1914. J.Lankford (Univ. of Missouri, Columbia, MO, USA).
J. Hist. Astron. (GB), vol.14, pt.2, p.77-91 (June 1983).
Examines the process of adapting large refracting telescopes for astronomical photography and to demonstrate how the experience led to the construction of the first large photographic refractor in the United States, the Thaw refractor. (71 refs.)

01.65 HISTORY OF SCIENCE

105085 An interdisciplinary science-humanities course. B.G.Dick (Dept. of Phys., Univ. of Utah, Salt Lake City, UT, USA).
Am. J. Phys. (USA), vol.51, no.8, p.702-8 (Aug. 1983).
A course in the intellectual tradition of the West containing a generous amount of the history of science is described. It has been successfully taught by scientist-humanist teams of two for the last seven years. A selected bibliography of books and articles which have proved to be useful is given. (5 refs.)

105086 Quantum physics and the stars. I. The establishment of a stellar temperature scale. D.H.DeVorkin, R.Kenat.
J. Hist. Astron. (GB), vol.14, pt.2, p.102-32 (June 1983).
After a review of the temperature-scale problem, and the establishment of a perceived need for an absolute calibration and physical interpretation of stellar spectra, the authors turn to the application of the quantum theory by Meg Nad Saha and the development of his theory of ionization, in which he identified for the first time a theoretical rationale for the Harvard spectral sequence. Finally, the authors examine how Saha's theory was elaborated and refined by Russell, by E.A. Milne, and by Cecilia Payne in her elucidation of the temperature scale represented by the spectral sequence of the stars. (109 refs.)

02.00 MATHEMATICAL METHODS IN PHYSICS

02.10 ALGEBRA, SET THEORY, AND GRAPH THEORY

105088 An upper bound on the Fibonacci number of a maximal outerplanar graph. A.F.Alameddine (Dept. of Math. Sci., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia).
Arabian J. Sci. & Eng. (GB), vol.8, no.2, p.129-31 (April 1983).
The Fibonacci number $f(G)$ of a simple graph G is the number of complete subgraphs of the complement graph of G. An upper bound on f is established for all maximal outerplanar graphs and this bound is proved to be the best possible. In particular, it is shown that $f(G) \leq F_n + 1$, where G is a maximal outerplanar graph of order $n \geq 3$ and F_n is the nth number in the Fibonacci sequence. (5 refs.)

105089 Semi-commutative operators for nonlinear evolution equations. N.Asano (Dept. of Engng. Maths., Utsunomiya Univ., Utsunomiya, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2320-4 (July 1983).
In local jet space, the author has constructed a pair of operators commuting on a given arbitrary manifold. The algorithm is applied to the nonlinear evolution equation of the polynominal type to obtain the Lax pair and the condition necessary and sufficient for the existence of the pair is given in the formal theory.

02.20 GROUP THEORY

(for algebraic methods in quantum mechanics, see 03.65; for symmetries in elementary particle physics, see 11.30)

105090 Contact super-algebra Lie-coarse. G.S.Shmelev.
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.5, p.569-70 (1983). In Russian.
As in the Lie-algebra, a space $H^2(g;g)$ describes the infinitesimal deformation of the super-algebra, Lie g. Since the quantisation is localised WRT the domain, the deformation of the Poisson super-algebra naturally would suggest that it is possible to 'quantize' over the space with an uneven number of even variables, as the contact super-algebra-analogue of the Poisson super-algebra is coarse. 'g' $= K(2n+1, m)$ — is the Lie contact super-algebra with standard filtering and OK, the corresponding scaling. The theorem $H^2(g;g)=0$ is supported by the three following lemmas: (i) the corresponding representative ω in $CU^2(g;g)$ of an element in $H^2(g;g)$ can be selected so that $\omega(K_0, k_-1 \oplus K_{-2})=0$ and $\omega(K_{-1}, K_{-1})=0$, (ii) with g: $K_{-1} \oplus K_{-1} \rightarrow K_{-2} \oplus K_{-1}$, there is such a linear operator so that $Z_i g(1) = 1g(z_i)$, $z_j g(z_j)$-$(-1)^{p(2i)p(2j)} Z_i g(Z_i) = g([Z,Z,])$, where 1-generatrix into K_{-2} and Z_i are homogeneous generatrices into K_{-1}. Then there is a singular element $1 \in K$ so that $g(x)=[x,1]$, (iii) if ω satisfies lemma(i) then ω is fine. (1 ref.) *R.H.*

105091 The Casimir operators of inhmogeneous groups. M.Chaichian (Dept. of High Energy Phys., Univ. of Helsinki, Helsinki, Finland), A.P.Demichev, N.F.Nelipa.
Commun. Math. Phys. (Germany), vol.90, no.3, p.353-72 (1983).
The authors have found the number of invariant operators for the inhomogeneous groups $IGL(n,R)$, $ISL(n,R)$, $ISO(p,q)$, $IU(p,q)$, $ISU(p,q)$, $ISp(2n)$, i.e. the inhomogeneous groups with the classical homogeneous subgroups, and also for the Weyl group $W(p,q)$. For some special cases explicit forms of the invariant operators are obtained. They also discuss the methods applied, together with problems in some cases, possible further developments and relevance for the supersymmetric theories. (21 refs.)

105092 Determination of the Weyl invariants and calculation of the coupling coefficients for unitary groups. M.Hage Hassen (Inst. de Phys. Nucleaire, Univ. Claude Bernard Lyon I, Villeurbanne, France).
J. Phys. A (GB), vol.16, no.13, p.2891-903 (11 Sept. 1983). In French.
The author presents a new approach for determining the Weyl invariants of unitary groups. Such an approach is based on the generating function of the basis of the representation for unitary groups built in an earlier work (Hage Hassan 1983). The author obtains two expressions for the Weyl invariants, both including the parameters involved in the generating function. Coupling coefficients appear in one of the expressions. The comparison of the development of the two expressions allows the calculation of the coupling coefficients. The application of this approach to the calculation of the coupling coefficients for the direct product $[\lambda^1 0] \otimes [\lambda^2 \mu^2]$ of SU(3) leads to an expression of the isoscalar factor where no summation occurs in contradistinction with the known expression for the coupling coefficients which involve five summations. (13 refs.)

105093 A family of groups generalising the Poincare group and their physical applications. A.O.Barut, M.A.Weiss (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).
J. Phys. A (GB), vol.16, no.13, p.2905-15 (11 Sept. 1983).
A family of groups $P^{(m,n)}$ parametrised by non-negative integers $m>n$ is studied generalising the Poincare group $P^{(1,1)}$. The action of finite-dimensional irreducible real representations of $SL(2, C)$ is used to form semi-direct products. The authors define the complete list of unitary irreducible representations for each $P^{(m,n)}$ by finding all sub-groups of $SL(2, C)$ which are little groups; some of the subgroups do not occur in the Poincare group. The geometry of the $SL(2, C)$ action and the classification of $SL(2, C)$ invariant tensors is considered. These groups are appropriate symmetry groups for field

theories in higher dimensions and generalise the notion of elementary relativistic quantum systems. (14 refs.)

02.30 FUNCTION THEORY, ANALYSIS

105094 On the dimension of the solution space of systems of linear differential equations. E.Akyildiz (Dept. of Maths., Middle East Tech. Univ., Ankara, Turkey).
Arabian J. Sci. & Eng. (GB), vol.8, no.2, p.133-7 (April 1983).
The author considers the systems of linear differential equations in n unknown functions on an open interval I in R $A_0Y^{(m)}+A_1Y^{(m-1)}+\ldots+A_mY=0$, where A_i is an $n\times n$ real matrix for each $i=0, 1,\ldots,m$, and $Y^{(k)}=[(d^ky_1)/(dx^k)]\ldots(d^ky_n)/(dx^k)]$, $k=0, 1,\ldots,m$. Writing D^k for d^k/dx^k, $k=0,1,\ldots,m$, system (1) can be written as $L(D)Y=0$, where $L(D)=A_0D^m+A_1D^{m-1}+\ldots+A_m$. $C_n{}^m(I)$ is taken as the space of m-times differentiable $n\times 1$ real matrix-valued functions on I, and $V=\{Y\in C_n{}^m(I):L(D)Y=0\}$. It is one of the classical theorems of the theory of differential equations that if A_0 is nonsingular, V is a finite-dimensional vector space, and $\dim V=mn$. The author discusses the case when A_0 is singular. The main theorem is then as follows: If the determinant of $L(t)$ is not equal to zero, then V is a finite-dimensional vector space, and in fact the dimension of V is equal to the degree of the determinant of $L(t)$. (2 refs.)

105095 Laplace transforms of Airy functions via their integral definitions. P.G.L.Leach (Dept. of Appl. Maths., La Trobe Univ., Bundoora, Australia).
J. Phys. A (GB), vol.16, no.13, p.L451-3 (11 Sept. 1983).
The Laplace transforms of the functions $\mathrm{Ai}(\pm\eta)$ and $\mathrm{Bi}(-\eta)$ are obtained using the integral definitions of these functions and a correction made to a recent derivation of the results of $\mathrm{Ai}(-\eta)$ and $\mathrm{Bi}(-\eta)$. (4 refs.)

105096 On the extremality of the action integral. A.Galindo, G.G.Alcaine (Dept. de Fisica Teorica, Facultad de Ciencias Fisicas, Ciudad Univ., Madrid, Spain).
J. Phys. A (GB), vol.16, no.13, p.2923-37 (11 Sept. 1983).
Some necessary and sufficient conditions for a critical point of the action integral to be locally or globally extremal are proved. Applications to systems with finite or infinite number of degrees of freedom are discussed. (36 refs.)

105097 Periodic solutions of some nonlinear evolution equations. G.Cicogna (Dipartimento di Fisica, Univ. di Pisa, Pisa, Italy).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.15, p.529-32 (13 Aug. 1983).
The author considers nonlinear evolution equations, and studies how steady bifurcating solutions can be transformed into time-dependent solutions as an effect of some symmetry-breaking perturbation. (18 refs.)

105098 Direct linearization of nonlinear difference-difference equations. F.W.Nijhoff, G.R.W.Quispel, H.W.Capel (Inst. Lorentz voor Theoretische Natuurkunde, Leiden, Netherlands).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.125-8 (22 Aug. 1983).
Starting from the linear integral equation for the solutions of the Korteweg-de Vries (KdV) equation, the authors obtain the direct linearization of a general nonlinear difference-difference equation. In a continuum limit this equation reduces to a general integrable differential-difference equation which contains e.g. the Toda equation and the discrete KdV and MKdV as special cases. (19 refs.)

105099 On the analytic solution of certain functional and difference equations. K.Mahler (Math. Dept., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1796, p.1-13 (8 Sept. 1983).
Let $P(u,v)$ be an irreducible polynomial with complex coefficients and let $q\geq 2$ be an integer. The author establishes the necessary and sufficient conditions under which the functional equation (F): $P(f(z),f(z^q))=0$, has a non-constant analytic solution that is either regular in a neighbourhood of the point $z=0$ or has a pole at this point (theorem 1). By a simple change of variable, the difference equation $P(F(Z),F(Z+1))=0$, can be proved under the same restrictions to have a non-constant solution of the form $F(Z)=\Sigma_{j=1}{}^{\infty}f_j\exp(-jq^z)$, $\mathrm{Re}\ Z\geq X_0$, $|\mathrm{Im}\ Z|<\pi/2\ \ln q$, if X_0 is sufficiently large (theorem 2). 03.00 CLASSICAL AND QUANTUM PHYSICS; MECHANICS AND FIELDS

105100 Nonconvex energy functions. Hemivariational inequalities and substationarity principles. P.D.Panagiotopoulos (Aristotle Univ., Thessaloniki, Greece).
Acta Mech. (Austria), vol.48, no.3-4, p.111-30 (1983).
The author derives certain new classes of variational principles for material laws and boundary conditions resulting from nonconvex, generally nondifferentiable, potentials. To this end two recently defined notions are employed, the 'generalized gradient' of Clarke and the 'derivate container' of Warga. Several general classes of problems are discussed and the respective variational forms called hemivariational inequalities are derived. For the respective static problems the equivalence of these forms to the 'substationarity' of the potential and complementary energy is discussed. Finally an integral inclusion formulation for certain classes of static problems is presented. (42 refs.)

03.20 CLASSICAL MECHANICS OF DISCRETE SYSTEMS: GENERAL MATHEMATICAL ASPECTS

(for applied classical mechanics of discrete systems, see 46.10; for celestial mechanics, see 95.10)

105101 Damped nonlinear oscillations modeled by a 3-dimensional differential system. G.N.Bojadziev (Simon Fraser Univ., Burnaby, British Columbia, Canada).
Acta Mech. (Austria), vol.48, no.3-4, p.193-201 (1983).
The asymptotic solution in the sense of Krylov-Bogoliubov-Mitropolskii of a 3-dimensional weakly nonlinear autonomous differential system is investigated. The system models oscillating processes characterized by strong damping. (9 refs.)

105102 Lagrangian mechanics and the geometry of configuration spacetime. M.Trumper (Max-Planck-Inst. fur Phys. und Astrophys., Garching, Germany).
Ann. Phys. (USA), vol.149, no.1, p.203-33 (Aug. 1983).
Holonomic rheonomic systems having a finite number of degrees of freedom are considered in classical nonrelativistic mechanics. It is shown that the configuration spacetime manifold $\mathfrak{M}$ of such a system can be furnished with a linear symmetric connection in such a way that the worldline of the system is a geodesic on $\mathfrak{M}$. The connection is based upon a degenerate metric structure which in turn is uniquely determined by the system and the forces acting on it. The connection is compatible with the generalised Galilei structure in the sense that the covariant derivatives of the latter vanish. Systems which can be described in terms of a Lagrangian give rise to a particularly interesting class of dynamical connections, called 'Lagrange connections', whose geometry is studied in some detail. Within the class of generalised Galilei connections they are characterised by a geometrical condition imposed on the affine curvature tensor. Noether symmetries of the dynamical system turn out to be equivalent to 'isometries' of the generalised Galilei structure together with the collineations of the Lagrange connection. They form a Lie group. Spacelike generators of Noether symmetries are linked to the existence of 'conservors'. Timelike generators of Noether symmetries give rise to (second rank) Killing tensors. (25 refs.)

105103 Damping estimation method using the spectral analysis technique based on the auto-regressive model fitting. K.Suzuki, A.Nakashima (Faculty of Technol., Tokyo Metropolitan Univ., Tokyo, Japan).
Bull. JSME (Japan), vol.26, no.215, p.832-8 (May 1983).
A practical method whereby the damping ratio of a structure subjected to random excitations can be estimated is proposed. This method is based on the characteristics of the AR spectral analysis technique by H. Akaike (1972). Using good correspondence of the shape of the frequency response function around the dominant peaks in the proposed method to that in the linear structural theory, estimation of the damping ratio to the fundamental vibration modes can be satisfactorily carried out by using curve-fitting technique. As a practical example, the damping ratio for the ground model which is necessarily used for the generation of an artificial earthquake motion is estimated and quite good results are obtained. It is expected that this method will be widely applicable to other technical dynamic problems in which estimation of damping is required. (14 refs.)

105104 A weighted least squares method for circle fitting to frequency response data. J.A.Brandon, A.Cowley (Mfg. & Machine Tool Div., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
J. Sound & Vib. (GB), vol.89, no.3, p.419-24 (8 Aug. 1983).
Despite the recent development of powerful multidegree of freedom curve fitting programs the advent of the microcomputer has meant that there is still scope for improvement of simpler single degree of freedom models. A weighted least squares curves fitting method, based on a well known conformal mapping, is described. This method is shown to have important theoretical advantages over some established methods. (8 refs.)

105105 Periodically forced linear oscillator with impacts: chaos and long-period motions. S.W.Shaw, P.Holmes (Dept. of Theoretical & Appl. Mech., Cornell Univ., Ithaca, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.623-6 (22 Aug. 1983).
A simple model is discussed for a periodically forced oscillator with a constraint which leads to motions with impacts. For 'perfectly plastic' impacts the dynamics is represented by a discontinuous map defined on the circle. The map is shown to undergo period-doubling bifurcations followed by complex sequences of transitions, due to the discontinuities, in which arbitrarily long superstable periodic motions occur. (12 refs.)

105106 Two uniform asymptotic expansions of $d_{MN}^{I}(\beta)$ for high values of I (angular momentum). N.Grama, S.Stoica (Central Inst. of Phys., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.4, p.289-94 (1983).
Based on the method of matched asymptotic expansions, two uniform asymptotic expansions of $d_{MN}^{I}(\beta)$ for high I ($M \ll I$, $N \ll I$) are established. (11 refs.)

03.30 SPECIAL RELATIVITY

105107 The arrow of electromagnetic time and the generalized absorber theory. J.G.Cramer (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
Found. Phys. (USA), vol.13, no.9, p.887-902 (Sept. 1983).
The problem of the direction of electromagnetic time, i.e. the complete dominance of retarded electromagnetic radiation over advanced radiation in the Universe, is considered in the context of a generalized form of the Wheeler-Feynman absorber theory in an open expanding Universe with a singularity at T=0. It is shown that the application of a four-vector reflection boundary condition at the singularity leads to the observed dominance of retarded radiation; it also clarifies the role of advanced and retarded waves in the emission of very weakly absorbed radiation such as neutrinos. (24 refs.)

105108 Anisotropic speed of light and four-dimensional symmetry of physical laws. J.P.Hsu (Phys. Dept., Southeastern Massachusetts Univ., North Dartmouth, MA, USA).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.137-9 (22 Aug. 1983).
The author demonstrates that Earth's west-east motion will not be detected by a recently proposed laser experiment. Within the four-dimensional symmetry framework, there is anisotropy of the one-way speed of light when one uses clock systems which differ from the relativistic clock systems; however, the two-way speed of light is still isotropic. (3 refs.)

Lorentz invariance in relativistic potential theory ....See Entry 105522

03.40 CLASSICAL MECHANICS OF CONTINUOUS MEDIA: GENERAL MATHEMATICAL ASPECTS

105109 Interfacial operators in the mechanics of composite media. R.Hill (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
J. Mech. & Phys. Solids (GB), vol.31, no.4, p.347-57 (1983).
Stress discontinuities in composite media can be treated systematically by splitting second-rank tensors at an interface into exterior and interior parts. With anisotropic response the decomposition needs support by an appropriate algebra of fourth-rank interfacial operators. This topic is reviewed by the author and some fresh standpoints are proposed. These lead to a reorganization of the algebra and its further development. The main new application is to elastoplastic composite whose response is subject to the normality flow-rule. Contact is also made with existing theories of incipient discontinuities in hyperbolic states of plastic deformation. (5 refs.)

105110 Coupled fields and nonclassical continuous media. D.Rogula.
Mech. Teor. & Stosow. (Poland), vol.20, no.1-2, p.19-28 (1982). In Polish.
Classical and non-classical continuous media theories are briefly reviewed referring to basic theories and authors. Recent contributions to a continuum theory (microstructures, momentary and hyperstresses, asymmetric sensors etc.) are briefly discussed. Micropolar elasticity theory is elaborated deriving basic mathematical expressions. Coupled fields are magneto-thermo-elasticity theories are similarly treated. An extensive bibliography is included. 105111 Homogenization with Fourier series. H.Dumontet (Univ. Pierre et Marie Curie, Paris, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.21, p.1625-8 (13 June 1983). In French.
Considers an elastic matrix with periodic elastic inclusions. The homogenized law is obtained by means of Fourier analysis. The computation of the homogenized behaviour requires the resolution of an infinite system of linear equations which depends on the geometry of the inclusion. (1 ref.)

105112 Thermoelasticity problems. W.Nowacki.
Mech. Teor. & Stosow. (Poland), vol.20, no.1-2, p.5-17 (1982). In Polish.
A mathematical analysis of thermoelasticity is presented, highlighting recent works of Polish scientists in this field. Basic equations of thermal elasticity are derived referring to the original contributors and explaining physical theories of elasticity. Stress wave propagation theories are reviewed. Asymmetric thermoelasticity and coupling effect theories are elaborated with reference to piezo- and magneto-thermoelasticity. An extensive bibliography is included. (64 refs.) *T.H.*

105113 Construction of a working model in the finite-element method for solution of three-dimensional problems of elasticity theory. G.A.Koklyuev (All-Union Thermotech. Sci.-Res. Inst., Moscow, USSR).
Strength Mater. (USA), vol.14, no.10, p.1404-6 (Oct. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.10, p.102-3 (Oct. 1982). [received: Sept. 1983]
An algorithm is proposed for the numbering of nodes of arbitrary three-dimensional grids of second-order finite elements, which ensures convenient interpretation of the working model. A method of representing a body of arbitrary shape in the form of large-scale curvilinear finite elements (first-level grid), which are then divided into smaller elements (second-level grid) is proposed on the basis of this algorithm. (5 refs.)

105114 On the stability of nonconservative differential equations. W.Kliem (Danmarks Ingeniorakademi, Lyngby, Denmark).
Z. Angew. Math. & Mech. (Germany), vol.63, no.7, p.329-31 (1983). In German.
An application of Gerschgorin's law to equations of type: $A\ddot{q}+B\dot{q}+Cq=0$ where A, B and C are matrices. Stability ensues when the Cassini curve lies to the left of a vertical line whose position is deduced from the coefficients. Two examples are given: one of a matrix equation and one to determine the stability of an elastically mounted motor with internal damping and elasticity. (10 refs.) *N.C.*

03.40G Fluid dynamics: general mathematical aspects

(see also 47. Fluid dynamics)

105115 Finite element techniques for computational fluid mechanics. B.Haggblad, M.Mattsson.
ASEA J. (Sweden), vol.56, no.1, p.32-9 (1983).
An overview is given of the basic steps in the application of the finite element method to a class of fluid flow problems commonly occurring at ASEA. Numerical techniques widely used for the solution of the resulting nonlinear equations are discussed and the experience gained in their use is reported. Some procedures for avoiding frequently experienced difficulties are described and demonstrated with the aid of a model problem. Laminar flow solutions to some engineering problems are presented. New solution strategies on larger and faster computers will have a great impact on computational work within industry. (2 refs.)

105116 Slowly rotating fluid spheres in the Einstein-Yukawa theory. K.D.Krori, A.R.Sheikh (Math. Phys. Forum, Cotton Coll., Gauhati, India).
Can. J. Phys. (Canada), vol.61, no.9, p.1324-7 (Sept. 1983).
The authors introduce slow rotation to a solution given by Krori et al. (1983) which represents fluid spheres in the Einstein-Yukawa theory, and present two new analytic solutions which are nonsingular and satisfy physical conditions throughout the spheres. One of the interior solutions represents uniformly rotating spheres and the other represents differentially rotating spheres. The authors also match the interior and exterior solutions on the boundary. (6 refs.)

105117 Many-sphere hydrodynamic interactions. II. Mobilities at finite frequencies. W.Van Saarloos, P.Mazur (Inst. Lorentz, Rijksuniv. te Leiden, Leiden, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.77-102 (1983).
For pt.I see ibid., vol.115, p.21 (1982). The authors extend their previously developed scheme to evaluate the static mobility tensors of an arbitrary number of spheres in a viscous fluid, to the case of finite frequencies. (27 refs.)

105118 Statistical mechanics of nonlinear hydrodynamic fluctuations. D.N.Zubarev, V.G.Morozov (V.A. Steklov Math. Inst., Acad. of Sci., Moscow, USSR).
Physica A (Netherlands), vol.120A, no.1-2, p.411-67 (1983).
The paper studies nonlinear hydrodynamic fluctuations by the methods of nonequilibrium statistical mechanics. The generalized Fokker-Planck equation for the distribution function of coarse-grained densities of conserved quantities is derived from the Liouville equation and then is investigated by using the gradient expansions in the flux correlation matrix. The authors have obtained the functional-differential Fokker-Planck equation describing the nonlinear hydrodynamic fluctuations in spatially nonuniform systems to second order in gradients of coarse-grained fluctuating fields. An outline of the derivation of Fokker-Planck equations containing the Burnett terms is also given. The explicit coordinate representations for the hydrodynamic Fokker-Planck equation is discussed in the case of one-component simple fluid. The general scheme of a change of coarse-grained functional variables is developed for hydrodynamic Fokker-Planck equations. The corresponding transformation rules are found for 'drift' terms, 'diffusion coefficients' and thermodynamic forces. The dynamical equations and stationary conditions for averages of functions (functionals) of hydrodynamic fields are discussed by using the Fokker-Planck operators acting on such functions. The explicit form of these operators are found for various sets of fluctuating fields. As an application of the formalism the calculation of the stationary correlation functions is presented for a simple nonequilibrium steady state. (28 refs.)

03.40K Waves and wave propagation: general mathematical aspects

(see also 46.30M Mechanical and elastic waves, 43.20 General linear acoustics)

105119 Basic methods for stability analysis of nonlinear oscillations and waves. F.M.Hamzeh (Dept. of Phys., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia).
Arabian J. Sci. & Eng. (GB), vol.8, no.2, p.87-97 (April 1983).
Linear stability analysis, Lyapunov analysis, and the Nyquist diagram are powerful tools to study plasma stability. Their applications, however, are not limited to the field of plasma physics. The paper presents a comprehensive (nonspecialized) discussion of these methods for stability analysis of nonlinear oscillations and waves. (8 refs.)

105120 On wave propagation in random particulate composites. A.I.Beltzer (Holon Technol. Inst. Holon, Israel), C.W.Bert, A.G.Striz.
Int. J. Solids & Struct. (GB), vol.19, no.9, p.785-91 (1983).
A new method is presented for analysis of wave propagation in random particulate viscoelastic composites. The method incorporates both the scattering effect and viscoelastic losses as well as the Kramers-Kronig relationships valid for any casual linear system. Explicit expressions for the attenuation and dispersion are given and compared with available experimental data. (21 refs.)

105121 Cylindrical Korteweg de Vries equation and Painleve property. W.-H.Steeb, M.Kloke, B.M.Spieker, W.Oevel (Theoretische Phys., Univ. Paderborn, Paderborn, Germany).
J. Phys. A (GB), vol.16, no.13, p.L447-50 (11 Sept. 1983).
The authors demonstrate that the Lax representation for the cylindrical Korteweg de Vries equation can be obtained with the help of the Painleve property of this equation. (6 refs.)

105122 Integral and Backlund transforms within symmetry groups of certain families of nonlinear differential equations. L.Hlavaty (Inst. de Investigaciones en Matematicas Aplicadas y en Sistemas, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), K.B.Wolf, S.Steinberg.
J. Phys. A (GB), vol.16, no.13, p.2917-22 (11 Sept. 1983).
The authors consider the symmetry groups for Burgers-type and KdV-type equations, as well as their intertwining under the Hopf-Cole and Miura transformations. It is shown that Lie point symmetries of the one equation in the family may be mapped into integral or Backlund transformations of another equation in the family. (11 refs.)

105123 Comparison of averaging methods for scalar wave propagation in a random elastic layer. B.Lenoach (Dublin Inst. for Advanced Studies, Dublin, Ireland).
J. Phys. A (GB), vol.16, no.13, p.2979-86 (11 Sept. 1983).
The problem of elastic wave propagation in a random layer overlying a homogeneous half-space is treated using an averaging method and the Born approximation. The wave is assumed to propagate normally to the layer so that the equations of motion are ordinary differential equations with random coefficients The two methods are shown to have different ranges of validity; the averaging method applies in the range where stochastic effects are important. (8 refs.)

105124 Molecular dynamics of interacting kinks. I. T.Nagai (Dept. of General Education, Kyushu Kyoritsu Univ., Kitakyushu, Japan), K.Kawasaki.
Physica A (Netherlands), vol.120A, no.1-2, p.587-99 (1983).
A system consisting of a large number (up to 40000) of kinks and antikinks moving under attractive interactions, which are annihilated on contacting each other, is studied using the method of molecular dynamics computer simulation. The average distance between neighboring kinks increases logarithmically in time after a short initial transient period. The size distribution function of domains between neighboring kinks is also computed and found to develop a characteristic cut-off structure. Interpretation of the results in terms of simple kinetic models is given. The results are compared with the recent neutron scattering experiments on layered antiferromagnets by Ikeda. (5 refs.)

105125 On the integration of a three-wave set of equations. R.O.Dendy, D.Ter Haar (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.129-30 (22 Aug. 1983).
It is shown that a certain set of equations describing the evolution of a three-wave system can be derived from a Hamiltonian. The authors show that this set has three integrals of motion which are in involution, so that the system is integrable. They then show how the equations can be integrated. (5 refs.)

105126 Ideal gas of particle-like excitations at low temperatures. V.K.Fedyanin, V.G.Makhankov (Joint Inst. for Nuclear Res., Lab. of Computation Techn. & Automation, Dubna, USSR).
Phys. Scr. (Sweden), vol.28, no.2, p.221-8 (Aug. 1983).
A phenomenological approach to the description of the equilibrium characteristics of 'kink' gas is proposed, which is based on model of lattice gas. A general simple technique for obtaining the dynamical structure factors (DSF) of solitons and bions in the 'gas' approximation is developed. The DSF defined by soliton excitations in the framework of the Klein-Gordon equation are obtained and discussed. It is shown that at low temperatures the bion type excitations dominate the contribution to the central peak (CP) as well as give rise to the satellites to appear at harmonics of the main bion frequency. Both the frequency of bions, Ω and their average density are defined by the temperature of a system. A possibility is discussed to generalize the results to (2+1) and (3+1) dimensional modes. (27 refs.)

105127 Soliton propagation in a randomly inhomogeneous medium. F.G.Bass, Yu.A.Sinitsyn (Inst. of Radiophys. & Electronics, Acad. of Sci., Ukrainian SSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.933-9 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1302-9 (Nov. 1982). [received: Sept. 1983]
Propagation of a one-dimensional soliton through a layer of three-dimensional random inhomogeneities is considered using the Sine-Gordon equation in the Born approximation. The structure and correlation functions of the soliton-resonator eigenmode are studied, as well as the fields which propagate in both directions from the soliton upon its transit through the inhomogeneous layer. (8 refs.)

105128 Nonlinear dispersive systems: theory and examples. F.A.Howes (Dept. of Math., Univ. of California, Davis, CA, USA).
Stud. Appl. Math. (USA), vol.69, no.1, p.75-97 (Aug. 1983).
Some recent results in the asymptotic theory of differential equations are applied to certain third-order scalar and vector boundary-value problems that model various nonlinear physicochemical and dispersive wave phenomena. The key to the author's approach is the reduction of the third-order problems to asymptotically equivalent second-order ones which are more amenable to analysis. Many examples are discussed, including the problem of solitary-wave solutions of generalized Korteweg-de Vries equations and coupled systems of such equations. (21 refs.)

105129 Evolution scheme to compute periodic solutions of first-order nonlinear equations containing translation operators. J.J.Keller, W.Egli (Brown Boveri Res. Centre, Baden, Switzerland).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.4, p.510-33 (July 1983).
An evolution scheme is proposed to compute periodic solutions of equations of the general form $f(df/dt)+Lf=0$ where L is a linear operator which may include translations. The convergence properties of the proposed scheme are investigated and compared with the convergence properties of alternative numerical solution methods. The application of the evolution scheme is illustrated with the computation of solutions of equations arising in nonlinear wave propagation. (7 refs.)

105130 Derivation of the nonlinear Schrodinger equation for shoaling wave-groups. M.Stiassnie (Ralph M. Parsons Lab., MIT, Cambridge, MA, USA).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.4, p.534-44 (July 1983).
A nonlinear Schrodinger equation with varying coefficients, describing the evolution of surface wave groups moving over an uneven bottom, is derived from Whitham's modulation equations (1974). The derivation yields new expressions for the wave-induced mean flow field. (6 refs.)

105131 Physics of vibrations and waves. 3rd edition. H.J.Pain.
Chichester, West Sussex, England: Wiley (1983), xvi+416 pp. [0 471 90182 2]
The book is written at undergraduate level and comprises 12 chapters dealing with the following subjects: simple and damped simple harmonic motion; the forced oscillator; coupled oscillations; transverse wave motion; longitudinal waves; waves on transmission lines; electromagnetic waves; waves in more than one dimension; Fourier methods; waves in optical systems; nonlinear oscillations; wave mechanics.

03.50 CLASSICAL FIELD THEORY

105132 Existence, uniqueness and iterative construction of motions of charged particles with retarded interactions. E.Eder (Max-Planck-Inst. fur Phys. und Astrophys., Garching, Germany).
Ann. Inst. Henri Poincare Sect. A (France), vol.39, no.1, p.1-27 (1983).
The author provides an existence and uniqueness proof and an iterative construction with an error estimate for the solution of a system of truncated equations of motion for the scattering problem of classical electrodynamics with initial conditions in the infinite past. It is assumed that the fields produced by the particles are given by the velocity-dependent terms of the retarded Lienard-Wiechert fields and that each particle moves according to the Lorentz force corresponding to the field produced by the other particle or particles. The acceleration-dependent parts of the retarded Lienard-Wiechert fields as well as the radiation reaction terms are disregarded. It is proved that one can choose, as initial values, the three components of the velocity of each particle and, in addition, three real numbers for each particle which can be looked at as initial values for the location of the particle in the infinite past. (4 refs.)

105133 Cerenkov radiation from periodic electron bunches. F.R.Buskirk, J.R.Neighbours (Phys. Dept., Naval Postgraduate School, Monterey, CA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1531-8 (Sept. 1983).
Cerenkov radiation is calculated for electron beams which exceed the velocity of radiation in a nondispersive dielectric medium. The electron beam is assumed to be bunched as emitted from a traveling-wave accelerator, and the emission region is assumed to be finite. Predictions include (a) emission at harmonics of the bunch rate, (b) coherence of radiation at low frequencies, (c) smearing of the emission angle for finite emission regions, and (d) explicit evaluation of the power spectrum in terms of bunch dimensions. The results apply to microwave emission from fast electrons in air or other dielectrics. (13 refs.)

03.65 QUANTUM THEORY; QUANTUM MECHANICS

(see also 05.30 Quantum statistical mechanics; for relativistic wave equations, see 11.10)

105134 A reinterpretation of quantum mechanics. A.H.Anastassov (Faculty of Phys., Sofia Univ., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.5, p.583-5 (1983).
A solution of the problem of corpuscular-wave dualism is proposed. It consists in the establishment of a continual-discrete, stochastic-deterministic space-time model of the 'particle in a quantum-mechanical sense'. This solution differs radically from the so-called Copenhagen interpretation. It has points of contact with de Broglie's double solution as well as with the fluid models (Schrodinger, Madelung, Janossy, etc.), but avoids their shortcomings. The main shortcoming of the double solution is that it retains the particle's trajectory while in the fluid models there is no trace of discreteness. Moreover, when two or more interacting particles are involved, the wave function and the corresponding fluid both lose their physical reality, being defined in a configurational rather than in a real physical space. The corpuscular-wave object described will be called a poletron. Mathematically, this is a pair of geometric objects in the space-time of the relativity theory. However, at the partial expense of depth and naturalness, a poletron can also be described classically, although its behaviour runs counter to the classical rules. This non-relativistic description will be given here. It is based on the notion of a quanton. A quanton is a classical particle (material point) which, however, is supershortliving (a 'particle-phantom'). (4 refs.)

105135 Algebraic representation for multiple anharmonic oscillators via compact and non-compact unitary groups. M.E.Kellman (Dept. of Chem., Northeastern Univ., Boston, MA, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.437-41 (19 Aug. 1983).
Couling of two and three Morse oscillators is treated algebraically using the compact and non-compact Lie groups $SU(n)$ and $SU(n,1)$. A model Hamiltonian which separates into harmonic, anharmonic, and coupling terms is expressed simply in terms of the ground generators. (29 refs.)

105136 Almost periodic Schrodinger operators. III. The absolutely continuous spectrum in one dimension. P.Deift, B.Simon (Dept. of Math., California Inst. of Technol., Pasadena, CA, USA).
Commun. Math. Phys. (Germany), vol.90, no.3, p.389-411 (1983).
For pt.II see Duice Math. J., vol.50, p.369-391 (1983). The authors discuss the absolutely continuous spectrum of $H=-d^2/dx^2+V(x)$ with V almost periodic, and its discrete analog $(hu)(n)=u(n+1)+u(n-1)+V(n)u(n)$. Special attention is paid to the set, A, of energies where the Lyaponov exponent vanishes; this set is known to be the essential support of the a.c. part of the spectral measure. They also provide a new proof of the Pastur-Ishii theorem and that the multiplicity of the absolutely continuous spectrum is 2. (19 refs.)

105137 $1/N$ expansion for invariant potentials in quantum mechanics. J.Avan, H.J.de Vega (Lab. de Phys., Theorique et Hautes Energies, Paris, France).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.1, p.61-80 (29 Aug. 1983).
The $1/N$ series for a general $O(N)$ invariant potential in quantum mechanics is analyzed in the functional integral approach. The authors solve the stationary-point equation (here it is a non-linear and non-local equation). The instanton solutions and their action are expressed in closed form. Potentials of different shapes are analyzed. The Kth order of the $1/N$ expansion for the ground state energy is obtained from the instanton solution up to order K^{-1}. This asymptotic formula reads in terms of quadratures of the potential. The series appears to be Borel summable for a wide class of potentials. (17 refs.)

105138 Some remarks on Coulomb and oscillator problems in R^N. H.Grinberg, J.Maranon, H.Vucetich (Dept. de Fisica, Univ. Nacional de la Plata, La Plata, Argentina).
KINAM Rev. Fis. (Mexico), vol.5, no.2, p.127-34 (1983).
The generalization of the Coulomb and harmonic oscillator problems to N dimensions, which easily follows from the basic commutation relations that are satisfied by any pair of mutually conjugate generalized coordinates and momenta, is used to generate connection for any dimension $N \geq 2$. (6 refs.)

105139 Some properties of the solutions of the Schrodinger equation with von Neumann boundary conditions. F.M.Fernandez, E.A.Castro (Seccion Quimica Teorica, INIFTA, La Plata, Argentina).
KINAM Rev. Fis. (Mexico), vol.5, no.2, p.179-84 (1983).
One of the best known approximations used in the study of the physical properties of alkaline metals consists in solving the Schrodinger equation for an electron moving within a spherical box. The volume of the sphere is taken as the atomic volume, and interactions are those with the nucleus and the remaining electrons. The solutions of the differential equation must satisfy the von Neumann boundary conditions (VNBC) on the spherical surface. This procedure has been widely applied, but up to now the analysis made about the eigenvalues and eigenfunctions have not shown their relevant properties with sufficient clearness. The purpose of the note is to show in a rigorous way the dependence of the eigenvalues as a function of the radius of the sphere. (12 refs.)

105140 Discussion of several analytical approximate expressions for the eigenvalues of the bounded harmonic oscillator and hydrogen atom. G.A.Arteca, S.A.Maluendes, F.M.Fernandez, E.A.Castro (Seccion Quimica Teorica, INIFTA, La Plata, Argentina).

Int. J. Quantum Chem. (USA), vol.24, no.2, p.169-84 (Aug. 1983).

Several approximate analytical formulas for the multidimensional isotropic bounded oscillators and the bounded hydrogen atom are compared. Numerical results show that the coth z method is in both cases better than the Pade approximants method. Perturbational polynomials, necessary in order to build the approximate eigenvalues, are obtained through the hypervirial perturbative method. (57 refs.)

105141 Fractional angular momentum, fractional charge, and oscillators. E.Lubkin (Dept. of Phys., Univ. of Wisconsin, Milwaukee, WI, USA).

Int. J. Theor. Phys. (USA), vol.22, no.7, p.653-75 (July 1983).

The monoaxial torsional pendulum's angle Θ relative to the lab is free real, neither mod 2π nor 4π. Hence the conjugate angular momentum is also free real, even quantum mechanically. If the ${}^1/_2 k\Theta^2$ potential is relaxed at large Θ to $2\pi N$ periodicity, then the quantum of angular momentum is partially reestablished, to fractional $\hbar/N$. If the pendulum were built by tensor product from designated constituent atoms, addition of angular momentum would deny the foregoing; however, the tie to atoms is as a collective mode instead. Similarly, the L-C oscillator has free real electric charge Q on one plate of the capacitor. The other plate, accommodating $-Q$, is here 'the lab' or 'ground'; observability of current breaks superselection of charge. These comments should alternatively develop from a Born-Oppenheimer approximation. (27 refs.)

105142 Computational complementarity. D.Finkelstein, S.R.Finkelstein (School of Phys., Georgia Inst. of Technol., Atlanta, GA, USA).

Int. J. Theor. Phys. (USA), vol.22, no.8, p.753-79 (Aug. 1983).

Interactivity generates paradox in that the interactive control by one system C of predicates about another system-under-study S may falsify these predicates. The authors formulate an 'interactive logic' to resolve this paradox of interactivity. The construction generalizes one, the Galois connection, used by Von Neumann for the similar quantum paradox. The authors apply the construction to a transition system, a concept that includes general systems, automata, and quantum systems. In some (classical) automata S, the interactive predicates about S show quantumlike complementarity arising from interactivity. The interactive paradox generates the quantum paradox. Some classical Ss have noncommutative algebras of interactively observable coordinates similar to the Heisenberg algebra of a quantum system. It is conceivable that some quantum effects in nature arise from interactivity. (24 refs.)

105143 Limiting absorption principle for some Schrodinger operators with exploding potentials. II. W.Jager (Univ. Heidelberg, Heidelberg, Germany), P.Rejto.

J. Math. Anal. & Appl. (USA), vol.95, no.1, p.169-94 (Aug. 1983).

For pt.I see ibid., vol.91, no.1, p.192 (1983). In part I, the authors used the assumption that for real $\mu=\lambda$ the solution of their basic equation is unique in the class of smooth functions which satisfy their adjustment of the Sommerfield radiation condition. This adjustment was defined with the aid of an approximate phase, introduced in conditions I-V of part I. They prove this uniqueness property. Their proof is, essentially, an adjustment of that of Kato (1959) concerning growth properties of the solutions of the reduced wave equation. Their description of these growth properties is with the aid of their approximate phase, which for the case of a short range potential gives the usual one. (12 refs.)

105144 The nonlinear Schrodinger-type equations reducible to the second Painleve equation. S.Kawamoto.

J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2613-16 (Aug. 1983).

It is shown that similarity solutions of the nonlinear Schrodinger equation with an inhomogeneous term satisfy the second Painleve equation, and a new nonlinear partial differential equation reducible to the second Painleve equation can be derived through the similarity variables.

105145 Contact symmetries of general linear second-order ordinary differential equations. R.Martini, P.H.M.Kersten (Dept. of Appl. Maths., Twente Univ. of Technol., Enschede, Netherlands).

J. Phys. A (GB), vol.16, no.13, p.L455-60 (11 Sept. 1983).

Using 1-1 mappings, the complete symmetry groups of contact transformations of general linear second-order ordinary differential equations are determined from two independent solutions of those equations, and applied to the harmonic oscillator with and without damping. (7 refs.)

105146 On the radius of convergence of Rayleigh-Schrodinger perturbative solutions for quantum oscillators in circular and spherical boxes. V.C.Aguilera-Navarro (Inst. de Fisica Teorica, Sao Paulo, Brazil), J.F.Gomes, A.H.Zimerman, K.Ley Koo.

J. Phys. A (GB), vol.16, no.13, p.2943-52 (11 Sept. 1983).

The energy eigenvalues of harmonic oscillators in circular and spherical boxes are obtained through the Rayleigh-Schrodinger perturbative expansion, taking the free particle in a box as the non-perturbed system. The perturbative series is shown to be convergent for small boxes, and an upper bound for the radius of convergence is established. Pade-approximant solutions are also constructed for boxes of any size. Numerical comparison with the exact eigenvalues—which are obtained by constructing and diagonalising the Hamiltonian in the basis of the eigenfunctions of the free particle in a box—corroborates the accuracy and range of validity of the approximate solutions, particularly the convergence and the radius of convergence of the perturbative series. (13 refs.)

105147 On the applicability of the Hill determinant method. A.Hautot, M.Nicolas (Inst. of Phys., Univ. of Liege, Liege, Belgium).

J. Phys. A (GB), vol.16, no.13, p.2953-9 (11 Sept. 1983).

The authors show that, contrarily to what Flessas and Anagnostatos claim (1982), the so-called Hill determinant method is perfectly suited to the numerical resolution of Schrodinger's equation. (19 refs.)

105148 Radiation damping in the pilot wave interpretation of quantum mechanics. M.C.Robinson, C.E.Aveledo, L.A.Lameda, D.Bonyuet-Lee (Dept. de Fisica, Univ. de Oriente, Cumana, Venezuela).

J. Phys. A (GB), vol.16, no.13, p.2987-91 (11 Sept. 1983).

To avoid the internal contradiction in the pilot wave interpretation inherent in the assumption of a charged particle moving in a closed orbit without radiating, it is proposed that the wavefunctions, $\psi_n(\mathbf{r})$, corresponding to stationary states be real, implying that the particle is stationary. If the effect of radiation damping is included, the Hamiltonian contains a nonlinear term resulting in the stability of the stationary states. (5 refs.)

105149 Quantum decay and the Mandelstam-Tamm-energy inequality. K.Bhattacharyya (Dept. of Phys. Chem., Indian Association for the Cultivation of Sci., Jadavpur, Calcutta, India).

J. Phys. A (GB), vol.16, no.13, p.2993-6 (11 Sept. 1983).

The Mandelstam-Tamm time-energy inequality is exploited to obtain a transparent expression of the lifetime-energy uncertainty relation for decaying quantum systems along with some useful features of the quantum non-decay probability. (13 refs.)

105150 Exact propagator for reflectionless potentials. R.E.Crandall (Dept. of Phys., Reed Coll., Portland, OR, USA).

J. Phys. A (GB), vol.16, no.13, p.3005-11 (11 Sept. 1983).

The exact space-time propagation for a general reflectionless potential is obtained in closed form involving error functions. It is indicated how bound states and transmission coefficients may be recovered from asymptotic behaviour of the propagator. A sum rule is derived that shows how the leading terms of the short-time form of the propagator can be used rigorously in a Feynman path integral formalism. (15 refs.)

105151 The close-coupling equations for three-particle Coulomb system with finite masses. M.Gailitis (Inst.of Phys., Acad. of Sci., Riga-Salaspils, Latvian SSR).

J. Phys. B (GB), vol.16, no.17, p.3201-12 (14 Sept. 1983).

In scattering processes with three charged finite mass particles the close-coupling approximation equations are derived separating the angular part and transforming the exchange terms to the form without derivatives. General expressions are obtained to compute the potentials and exchange kernels between any bound two-particle Coulomb states at any masses, charges and total angular momentum. (17 refs.)

105152 A coarse grained description of time evolution: irreversible state reduction and time-energy relation. R.Bonifacio (Dipartimento di Fisica, Univ. di Milano, Milano, Italy).

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.14, p.481-9 (6 Aug. 1983).

Shows that proper coarse grained description of time evolution leads to a finite-difference equation with step τ for the density operator. This implies state reduction to the diagonal form in the energy representation and a quasi-ergodic behaviour of quantum-mechanical ensemble averages. An intrinsic time-energy relation $\tau_{\triangle}E \geq \hbar/2$ is proposed and its equivalence to a time quantization discussed. (4 refs.)

105153 A conceivable lattice structure of the Coulomb law. E.Papp, R.M.Santilli (Inst. for Basic Res., Cambridge, MA, USA).

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.14, p.505-8 (6 Aug. 1983).

Presents a few heuristic remarks on recent extensions of the Coulomb law via effective potentials and other means, which appear to admit a lattice structure in time and space whose spacings are given by the characteristic period of the electron and its Compton wavelength, respectively. (12 refs.)

105154 Dispersion approach to the quantum-mechanical stability. E.Papp (Inst. for Basic Res., Cambridge, MA, USA).

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.17, p.593-9 (27 Aug. 1983).

Proofs have been given that it is possible to define valuable quantum-mechanical stability constraints on the coupling constants or on the rest mass values in terms of underlying controllability requirements of the dispersion-shifts due to the interactions. The evaluation of such dispersions is accomplished by using suitable non-Hermitian operators which belong generally to a nonassociative algebra. (20 refs.)

105155 A Darboux-Backlund transformation associated with a discrete nonlinear Schrodinger equation. A.R.Chowdhury, G.Mahato (Dept. of Phys., Jadavpur Univ., Calcutta, India).

Lett. Math. Phys. (Netherlands), vol.7, no.4, p.313-17 (July 1983).

A Darboux-Backlund transformation for the differential-difference nonlinear Schrodinger equation is deduced. It is observed that it is also possible to derive the analogue of the usual Backlund transformation giving the direct connection between the two sets of the old and new nonlinear field variables, from the Darboux-Backlund itself. Also, it is seen that the different polynomial dependence of the B matrix on the eigenvalue parameter gives rise to various kinds of Backlund transformations—a phenomena not encountered in the usual derivation of the Backlund transformation. (3 refs.)

105156 Stochastic processes and the evolution of quantum observables. J.Bertrand, G.Rideau (Univ. Paris VII, Paris, France).

Lett. Math. Phys. (Netherlands), vol.7, no.4, p.327-37 (July 1983).

The classical results of stochastic calculus are extended to the equations giving the evolution of quantum observables in terms of their Weyl symbols, when the free Hamiltonian in $h_0(p)+qh_1(p)$ or $(p^2/2m)+(m\omega^2/2)q^2$ and the interaction potential is the Fourier transform of a bounded measure. The arising stochastic processes are purely jump processes. (5 refs.)

105157 Contractive states and the standard quantum limit for monitoring free-mass positions. H.P.Yuen (Dept. of Electrical Engng. & Computer Sci., Northwestern Univ., Evanston, IL, USA).

Phys. Rev. Lett. (USA), vol.51, no.9, p.719-22 (29 Aug. 1983).

The familiar minimum-uncertainty wave packets for masses are generalized in analogy with the two-photon coherent states of the radiation field. The free evolution of a subclass of these states, the contractive states, leads to a narrowing of the position uncertainty in contrast with the usual minimum-uncertainty wave packets. As a consequence the standard quantum limit for monitoring the positions of a free mass can be breached. Further implications on quantum nondemolition measurements are discussed. (15 refs.)

105158 Distribution of energy eigenvalues in the irregular spectrum. P.Pechukas (Dept. of Chem., Columbia Univ., New York, NY, USA).

Phys. Rev. Lett. (USA), vol.51, no.11, p.943-6 (12 Sept. 1983).

The distribution of energy eigenvalues in the irregular spectrum is derived in the semiclassical unit $\hbar \to 0$ by use of a plausible assumption on the spatial distribution of the corresponding eigenfunctions. (21 refs.)

105159 Quantum Kolmogorov-Arnol'd-Moser-like theorem: fundamentals of localization in quantum theory. G.Hose, H.S.Taylor (Fundamenteel Onderzoek der Materie, Inst. voor Atoom-en Molecuulfysica, Amsterdam, Netherlands).

Phys. Rev. Lett. (USA), vol.51, no.11, p.947-50 (12 Sept. 1983).

A quantum Kolmogorov-Arnol'd-Moser-like theorem is formulated with use of an existence condition of a unique transformation between eigenstates of integrable and nonintegrable Hamiltonians. This condition determines the ability to assign local quantum numbers to eigenstates of nonintegrable Hamiltonians and explains localization phenomena. (11 refs.)

105160 A new three-body equation. A.V.Matveenko (Joint Inst. for Nuclear Res., Dubna, USSR).

Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.11-14 (15 Sept. 1983).

The author starts with the Schrodinger equation for the three-body problem in the molecular state approach. A new representation is built, which 'kills' cross derivatives in the Schrodinger equation. This new equation has a simple form and 'good' asymptotic properties. It may be interpreted as an equation for quasiparticles with masses depending on coordinates. Moreover, a potential energy term is modified and acquires the form of the three-particle interaction. This modification is of kinematic nature. (6 refs.)

105161 Sturmian expansion approximation to three-body scattering. D.Eyre, H.G.Miller (Nat. Res. Inst. for Math. Sci., CSIR, Pretoria, S Africa).
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.15-17 (15 Sept. 1983).
An L^2 discretization of continuum effects using sturmian functions is tested in a model three-body problem. Numerical results are obtained in the low energy scattering region for a system of three bosons interacting via nonseparable pairwise interactions. The present results suggest that the method may be applicable to solving the more general N-body case. (4 refs.)

105162 Aharonov-Bohm effect for trapped ions. R.R.Lewis (Dept. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1228-36 (Sept. 1983).
The role of the Aharonov-Bohm effect is analyzed for the bound states of a charged particle in the superposition of two fields: a uniform magnetic field plus the vector potential of a solenoid. Exact solutions are given for a solenoid of zero size and the corrections due to finite size are discussed. It is shown that a series of new 'betatron resonances' appear in the spectrum, dependent on the flux quantum number $f=e\Phi/hc$. The fundamental betatron resonance remains narrow and unshifted for solenoid radii large enough to broaden and shift the cyclotron resonance. (16 refs.)

105163 Kinetic equation for correlation functions of a quantum system interacting with a Gaussian thermostat. S.A.Dyagilev (Gor'kii State Univ., Gor'kii, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.12, p.1029-35 (Dec. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.12, p.1455-63 (Dec. 1982). [received: Sept. 1983]
An exact kinetic equation is found for the correlators of a quantum system interacting with a Gaussian thermostat. In the case when the energy of interaction of the system and thermostat is small, one-moment and two-moment approximations are constructed and regression equations for the fluctuations are obtained. The expressions found are illustrated on the example of the non-Markov relaxation of a quantum harmonic oscillator. (14 refs.)

03.70 THEORY OF QUANTIZED FIELDS
(see also 11.10 Field theory)

105164 On one effective realisation of the canonical calculations procedure in quantum field theory using as an example the self-energies in n-dimensional models of scalar neutral fields. V.I.Kucheryavii.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.5, p.62-4 (1983). In Ukrainian.
Obtains explicit expressions for regular (finite) values of self-energies for n-dimensional neutral scalar field models with self-interaction $L_{int}=g_0\phi^N(x)$. The author also proposes an effective realisation of a canonical subtraction procedure which uses some properties of special functions. (9 refs.)

Quantization of the tensor gauge field of second rank in any gauge ....See Entry 105463

03.80 GENERAL THEORY OF SCATTERING
(see also 11.20 S-matrix theory, and 11.80 Relativistic scattering)

105165 Multiple scattering in closely packed systems of arbitrary non-overlapping shapes. B.D.Keister (TRIUMF, Vancouver, BC, Canada).
Ann. Phys. (USA), vol.149, no.1, p.162-78 (Aug. 1983).
It has long been known that the multiple scattering of waves from a system of obstacles of finite extent can be described completely with a knowledge of the on-shell amplitudes of the individual scatterers, provided that the minimally enclosing spheres concentric with the scattering centres do not overlap. It is shown that on-shell amplitudes alone suffice for a wider class of scattering configurations, in which the individual scatterers do not overlap, but their geometries do not satisfy the above condition. These extended geometries require a careful treatment of certain partial wave sums. An example is also discussed in which a pair of non-overlapping scatterers requires more than the on-shell amplitudes for a solution. (28 refs.)

105166 Geometrical characterisation of asymptotic wavefronts in *N*-body scattering. S.Servadio (Istituto di Fisica, Univ. di Pisa, Pisa, Italy).
J. Phys. A (GB), vol.16, no.13, p.2997-3003 (11 Sept. 1983).
The differential geometry of admissible wavefronts of N-body scattering is investigated for each term of the multiple scattering series and within angular sectors of uniform asymptotic behaviour. The differential equations are dimension independent in form and thus investigated in R_n. A general theorem is proved stating that, if not spherical, the wavefront must be a (ruled) $K=0$ surface tangent to a sphere around the origin. For $n=3$ a rather simple geometrical description is given of the most general structure. (10 refs.)

105167 Extending the region of convergence of the iteration method of solution of the inverse refraction problem. S.V.Baikov, V.A.Burov, A.A.Goryunov, A.V.Saskovets (Dept. of Acoustics, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.24-8 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.22-6 (1982).
The authors consider the determination of the inhomogeneity of the velocity of propagation on waves in a medium, from the data on the field scattered from this inhomogeneity. A multistage iteration algorithm is presented for the solution of the problem which is free from limitations of the region of convergence, and can also be used for scattering from strong inhomogeneity for which the scattered field exceeds in the incident field. This extension of the region of convergence is achieved by solving only a small fraction of the scattered field at each stage, and the obtained intermediate estimates of the inhomogeneity are used in the calculation of the Green function for the following interaction stage. (9 refs.)

105168 Iteration algorithm for the solution of the inverse scattering problem. V.A.Burov, A.A.Goryunov, A.V.Saskovets (Dept. of Acoustics, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.102-4 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.87-9 (1982).
The authors develop an effective iteration algorithm for the solution of the inverse scattering problem. The rate and region of convergence, are estimated. (2 refs.)

105169 An estimate of scatterers by the method of averaging in tomographic problems. V.A.Burov, A.A.Goryunov, A.V.Saskovets (Dept. of Acoustics, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.105-7 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.89-91 (1982).
The authors give an estimate for the error in the determination of reemission coefficients of discrete scatterers in the solution of the inverse scattering problem by the averaging method. The results are presented of a model experiment which confirm the theoretical estimates of the accuracy of the solution. (3 refs.)

04.20 GENERAL RELATIVITY
(see also 02.40 Geometry and topology)

105170 Nonlinear electromagnetics in vacuo: gravitational effects. C.Biscari, D.Cuomo, G.Franceschetti, G.Panariello, I.Pinto (Univ. di Napoli, Istituto Elettrotecnico, Napoli, Italy).
Alta Freq. (Italy), vol.52, no.3, p.167-9 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982).
Nonlinear corrections to vacuum electromagnetic fields are predicted by both Quantum Theory and Classical General Relativity. The Volterra functional expansion allows evaluation of these corrections up to any order in a systematic way. (15 refs.)

105171 Locally Hermit-Einstein, self-dual gravitational instantons. M.Przanowski (Inst. of Phys., Tech. Univ., Lodz, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.8, p.625-7 (Aug. 1983).
It is shown that for locally Hermit-Einstein, self-dual gravitational instanton, Einstein's equations can be reduced to a single, second-order, non-linear equation. (3 refs.)

105172 Localisation of energy in general relativity. Liu Wen-sen (Dept. of Phys., Shanxi Univ., Taiynan, China).
Acta Phys. Sin. (China), vol.32, no.4, p.515-19 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983] (6 refs.)

105173 The fibrous space-time structure of the rotating disc. R.Martinez-Chavanz (Dept. de Fisica, Univ. de Antioquia, Medellin, Colombia).
Rev. Colomb. Fis. (Colombia), vol.15, no.1, p.141-8 (1981). In Spanish. [received: Aug. 1983]
A treatment of the geometrical infrastructure for a future gauge theory for the interference phenomena which take place above a rotating disc. These are the result of the interaction between a gravitational field and an electromagnetic field. A method is developed which will lead to second order corrections to the previous treatment of the Sagnac effect. (12 refs.) *N.C.*

105174 Classical and quantal Einstein relativistic two-particle systems. T.Aaberge (Dept. de Phys. Theorique, Univ. de Geneve, Geneve, Switzerland).
Int. J. Theor. Phys. (USA), vol.22, no.8, p.723-52 (Aug. 1983).
The author presents formalisms for the description of two-particle systems of classical and of quantal Einstein relativistic particles. For each case the presentation follows a standard scheme. The author defines the phase-space, the observables, and the action of the kinematical symmetry group in the center-of-mass representation. The author then discusses some of the elementary features of the description of two-particle systems in order to interpret the objects considered. In particular it is shown that the description of the free particles conforms to standard relativistic kinematics. As an application the author discusses the system consisting of two charged particles interacting via the Coulomb field. (21 refs.)

105175 Motion of a classical particle with spin. II. Calculation of Dirac brackets. J.R.Ellis (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).
J. Phys. A (GB), vol.16, no.13, p.2967-78 (11 Sept. 1983).
For pt.I see ibid., vol.15, p.409 (1982). The author continues the canonical formalism of paper I for the motion of a free particle. By the use of a computer the relevant matrices necessary for the computation of all Dirac brackets are established. An algorithm is described which allots numerical values to the canonical variables satisfying the constraints, and these values are used in the construction of the matrices. Algebraic expressions for Dirac brackets are predicted from a first set of numerical data, and these predicted expressions are confirmed by at least two further sets of data. Reduction to a sufficient set of variables is attempted and the reduced set expressed as a Lie algebra. (16 refs.)

105176 Rigidly rotating charged dust distribution in general relativity. S.K.Chakraborty, N.Bandyopadhyay (Phys. Dept., Presidency Coll., Calcutta, India).
J. Phys. A (GB), vol.16, no.13, p.3013-17 (11 Sept. 1983).
Following two recent papers by Bonnor (1980) and Raychaudhuri (1982) on the motion of charged dust in general relativity, the authors obtain exact solutions of the Einstein-Maxwell equations in both cylindrically symmetric and axially symmetric cases. (5 refs.)

105177 Cylindrically symmetric Einstein-Maxwell-massless scalar field equations. T.Singh, L.N.Rai, R.B.S.Yadav (Inst. of Technol., Banaras Hindu Univ., Varanasi, India).
J. Math. & Phys. Sci. (India), vol.17, no.3, p.245-30 (June 1983).
A procedure is presented which enables one to construct solutions to the cylindrically symmetric gravitational field coupled to electromagnetic and massless scalar fields. The method is applied to a known solution of Einstein-Maxwell equations. (20 refs.)

105178 A note on electromagnetic 'tidal' force. S.Prakash, S.R.Roy (Dept of Math., Banaras Hindu Univ., Varanasi, India).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.15, p.525-8 (13 Aug. 1983).
A brief outline for the study of the structure of $F_{ij;k}$ is presented and has been illustrated for a Coulomb field and a plane electromagnetic wave. (3 refs.)

105179 Parallel-tetrad on null geodesics in Kerr and Kerr-Newman space-time. J.-A.Marck (Groupe d'Astrophys. Relativiste, Obs. de Paris, Meudon, France).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.140-2 (22 Aug. 1983).
A quasi-orthonormal tetrad that is parallel-propagated along null geodesics in the Kerr and Kerr-Newman space-time is constructed explicitly. (8 refs.)

105180 On a class of nonstatic perfect fluid spheres in general relativity. H.Knutsen (Inst. of Theoretical Astrophys., Univ. of Oslo, Oslo, Norway).
Phys. Scr. (Sweden), vol.28, no.2, p.129-35 (Aug. 1983).
The line element given by McVittie for a spherically symmetric distribution of matter is generalized. Conditions which are necessary and sufficient are given for the density to be uniform. The motion of the matter configuration is investigated with a view to oscillations using different physical conditions and initial conditions. It is shown that for many classes of solutions, these conditions are sufficient to conclude that oscillations are not possible. Particularly it is found that for a gaseous mass, oscillations are not possible. For other classes of solutions, it is shown that the conditions necessary for the solutions to be physically acceptable, are consistent with oscillations. However, these conditions are in general not sufficient. (14 refs.)

105181 General relativistic axisymmetric rotating systems: coordinates and equations. J.M.Bardeen (Univ. of Washington, Seattle, WA, USA), T.Piran.
Phys. Rep. (Netherlands), vol.96, no.4, p.205-250 (June 1983).
The Einstein equations for rotating axisymmetric configurations in asymptotically flat spacetimes are put in a form suitable for numerical calculations of dynamics. The discussion is motivated by the astrophysical problem of gravitational collapse with generation of gravitational radiation and possibly black hole formation. In the context of topological spherical coordinates there are two spatial gauge conditions which greatly simplify the Einstein equations and are compatible with regularity at the origin. The authors focus on one, the radial gauge, which generalizes Schwarzschild coordinates and is asymptotically a transverse-traceless gauge for gravitational radiation. The shift vector equation and the Hamiltonian constraint are parabolic equations in the radial gauge, rather than the usual elliptic equations. Two hypersurface conditions are explored in detail, the maximal hypersurface condition and another 'polar' hypersurface condition which fits naturally with the radial gauge. (20 refs.)

105182 The initial value problem and dynamics. J.W.York,Jr. (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.175-201
The author reviews general relativity as a dynamical theory of gravity with an initial data surface. The initial value problem is considered with construction of space-times. (45 refs.)

04.30 GRAVITATIONAL WAVES AND RADIATION: THEORY

105183 The theory of gravitational radiation: an introductory review. K.S.Thorne (California Inst. of Technol., Pasadena, CA, USA).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.1-57
The author presents a mathematical description of gravitational waves suitable for astrophysical applications. Various methods for analysing propagation, interaction with detectors and computation of waves from sources are described. (66 refs.)

105184 Gravitational radiation and the motion of compact bodies. T.Damour (Obs. de Paris-Meudon, Meudon, France).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.59-144
Using a post-Minkowskian approximation method supplemented by a technique of asymptotic matching, the authors obtain the general relativistic gravitational field outside two compact bodies (neutron stars or black holes). The equations of orbital motion of the compact bodies are deduced from the vacuum field equations by an Einstein-Infeld-Hoffmann-Kerr type approach simplified by the use of complex analytic continuation. The same process of analytic continuation allows one to push the accuracy of the calculations up to the third order: gravitational field containing cubic nonlinearities and equations of motion deduced from the quartically non-linear vacuum Einstein equations. The construction of Noetherian quantities conserved up to c^{-4} allows separation and investigation of the c^{-5} secular kinematical effects caused by the finite velocity of propagation of gravity. These results agree with the phenomena observed in the Hulse-Taylor pulsar PSR 1913+16. (165 refs.)

105185 On the positivity of total gravitational energy at retarded times. M.Walker (Max-Planck-Inst. fur Astrophys., Garching, Germany).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.145-73
The author investigated the structure of the space-time asymptotically along null geodesics to determine the positivity of the gravitational energy at retarded times. (49 refs.)

105186 Methods of numerical relativity. T.Piran (Racah Inst. for Phys., Hebrew Univ., Jerusalem, Israel).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.203-56
Numerical relativity is an alternative to analytic methods for obtaining solutions for Einstein equations. Numerical methods are particularly useful for studying generation of gravitational radiation by potential strong sources. The author reviews the analytical background, the numerical analysis aspects and techniques and some of the difficulties involved in numerical relativity. (82 refs.)

105187 Theoretical models for sources of gravitational waves. D.M.Eardley (Harvard Coll. Obs., Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.257-96
Sources of gravitational radiation are never more than 100% efficient, by the Positive Energy Theorems, and efficiencies in likely astronomical sources are considerably less. Stellar core collapse to a neutron star or black hole is one possible source; for high efficiency the core must be deformed somehow. Accretion of bodies onto neutron stars or black holes provides another source, best when two nearly equally massive bodies collide; much theoretical work remains to be done in this case. Binary systems emit gravitational waves; observations of period change in PSR 1913+16 confirm this. (6 refs.)

105188 Extragalactic sources of gravitational waves. M.J.Rees (Inst. of Astron., Cambridge Univ., Cambridge, England).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.297-320
The prospects of detecting gravitational waves from galactic nuclei are shown to be bleak: although some 'scenarios', such as those involving black hole coalescence, would emit a pulse with ~ 0.1 efficiency, the predicted event rate is discouragingly low. If most of the 'unseen' mass in the Universe were in the remnants of massive 'Population III' stars—a possibility discussed—then the overlapping bursts from the collapse of such objects in early epochs would yield a stochastic background that could amount to $\sim 10^{-3}$ (or even more) of the critical cosmological density. Such a background may be above the detectability threshold for future experiments, and can be probed by studying the timing noise of pulsars, and the secular behaviour of the binary pulsar. General constraints on stochastic backgrounds, including 'primordial' gravitational radiation, are summarised. (57 refs.)

105189 Two points of view on gravitational energy. Y.Choquet-Bruhat (Univ. Paris VI, Paris, France).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.399-406
The author gives two examples of a rigorous mathematical study which leads to the appearance of a positive conserved quantity which it is legitimate to consider, in the context where it appears, as the energy of the gravitational field. The first example will be a high frequency perturbation of a given background, whose energy density can be defined locally, the second the global energy of an asymptotically flat space: the author in treating this example gives a new 3+1 formulation of Einstein equations (obtained in collaboration with T. Ruggeri), which splits them into the constraints and a hyperbolic evolution system, without use of harmonic coordinates. (no refs.)

105190 On the existence of asymptotically flat and empty spaces. H.Friedrich (Hochschule der Bundeswehr Hamburg, Hamburg, Germany).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.407-19
It is shown that Penrose's geometrical concept of 'asymptotical flatness' not only allows to investigate null infinity in terms of local differential geometry but also to discuss the existence of solutions of Einstein's vacuum field equations which have a smooth structure at null infinity by solving local initial value problems. For this purpose a regular representation of the conformal vacuum field equations is derived and a technique to reduce initial value problems for these equations is proposed. (19 refs.)

105191 Gauge and radiation conditions in numerical relativity. J.M.Bardeen (Phys. Dept., Univ. of Washington, Seattle, WA, USA).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.433-41
Gauge conditions suitable for numerical calculations of emission of gravitational radiation by compact sources are explored, with particular emphasis on algebraic conditions which simplify the structure of the Einstein equations. The expansion of the radiation field in powers of r^{-1} is compared in different gauges, and formulas for outgoing wave boundary conditions and asymptotic energy flux in the waves are obtained in the radial gauge which are accurate through order r^{-2}. (10 refs.)

105192 General relativistic collapse of rotating stars. T.Nakamura (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.443-53
Combining Geroch's and the ADM formalisms, the author gives a new formalism (called $[(2+1)+1]$-formalism) to treat the dynamical problems of space-time having a rotational Killing vector. By using this formalism, numerical calculations have been made for the collapse of rotating supermassive stars ($\sim 10^8\ M_\odot$) and rotating stars of 10 $M_\odot$. The number of calculated models is 22. It is suggested that Kerr black holes may be formed for wide ranges of initial conditions if $q(=\text{total angular momentum}/M(GM/C))$ is smaller than unity. For $q>1$, an expanding disk, ring or jets appears. The present numerical results approve the cosmic censorship hypothesis. (15 refs.)

105193 Interaction of gravitational waves with an elastic solid medium. B.Carter (Groupe d'Astrophys. Relativiste, Obs. de Paris, Meudon, France).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.455-64
The author presents an exactly consistent fully non-linear theory of the interaction of a gravitational field with an elastic solid from Einstein's theory. The weak field limit and conditions are obtained and the Dyson-Papapetrou equations derived. (15 refs.)

04.40 CONTINUOUS MEDIA; ELECTROMAGNETIC AND OTHER MIXED GRAVITATIONAL SYSTEMS

105194 Electromagnetism non-integrable phases and fibre bundles. J.Millan (Dept. de Fisica, Univ. del Valle, Cali, Colombia).
Rev. Colomb. Fis. (Colombia), vol.15, no.1, p.31-81 (1981). [received: Aug. 1983]
The author shows that the essential physical concepts required in a quantum description of electromagnetism (without magnetic monopoles) have the geometric structure of a connection on a trivial principal fiber bundle. Starting from a brief description of the general principles of quantum mechanics and using the physical notion of non-integrable phase he introduces the Principle of Gauge Invariance and its description according to Fiber Bundle Theory. (30 refs.)

04.50 UNIFIED FIELD THEORIES AND OTHER THEORIES OF GRAVITATION

105195 The change of e/m in the five-dimensional theory of gravitation, electromagnetism and scalar field. Yu.S.Vladimirov, V.V.Kislov (Dept. of Theoretical Phys., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.19-23 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.18-21 (1982).
The authors present the main equations of the unified five-dimensional theory of gravitation, electromagnetism and scalar field. The dependence of the ratio of the electric charge to the mass of a probe particle, on the value of the fundamental scalar field in a given point is discussed. This last quantity is determined by the solution of the system of Einstein, Maxwell and Klein-Fock equations. A formula is derived which describes the change of e/m. Data are presented on the measurement of the Josephson frequency ($\omega_J=2e/h$), which show a dependence on the time of year (the distance from the Earth to the sun), which makes it desirable to carry out direct experiments to test the stability of the ratio e/m. (6 refs.)

105196 Homothetic Killing tensors. G.Prince (School of Theoretical Phys., Dublin Inst. for Advanced Studies, Dublin, Ireland).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.133-6 (22 Aug. 1983).
A vectorfield approach to Killing tensors (KTs) is used to analyse the conventional definition of conformal Killing tensors (CKTs). It is shown that the CKT associated with a KT is removable and that so far as constants of the motion are concerned the homothetic Killing tensor defined here is more useful. A geometric interpretation of CKTs is also given. (5 refs.)

105197 Kaluza-Klein theory over coset spaces. M.A.Awada (Blackett Lab., Imperial Coll., London, England).
Phys. Lett. B (Netherlands), vol.127B, no.6, p.415-18 (11 Aug. 1983).
The author presents a new model of Kaluza-Klein reduction of Einstein theory over an arbitrary space $M_4 \times G/H$ which is a generalization of previous models. It resolves some confusion in the literature and uses techniques which should be applicable for constructing Kaluza-Klein supergravity theories. (8 refs.)

105198 Parallel torsions on Lie groups and spontaneous compactification in Kaluza-Klein theories. C.-H.Tze (Phys. Dept., Yale Univ., New Haven, CT, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.160-4 (25 Aug. 1983).
In d-dimensional Kaluza-Klein theories of gravity coupled to a rank-three fully antisymmetric gauge field, a Freund-Rubin type compactification into a product space of a $(d-r)$ hyperbolic constant curvature spacetime and a compact manifold of a r-parameter semisimple Lie group G_r is achieved. The index-three field takes on the geometrical meaning of the left or right parallelizable torsion of G_r. (23 refs.)

105199 On a unified theory for interaction and matter fields. N.A.Batakis (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.165-8 (25 Aug. 1983).
A unified theory is proposed for the gravitational and electromagnetic fields, as well as matter fields with spin and electric charge, all accommodated into the connection of a Riemann-Cartan space-time. The construction seems to admit a maximal extension, incorporating the electroweak interactions. (9 refs.)

105200 Induced Einstein-Maxwell action in Kaluza-Klein theory. D.J.Toms (Dept. of Phys., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA).
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.31-5 (15 Sept. 1983).
It is shown how quantum corrections due to matter fields on a five-dimensional Kaluza-Klein background can lead to an induced Einstein-Maxwell action in four dimensions. Results are given for the induced cosmological and gravitational constants when scalar and spinor fields are present. (23 refs.)

105201 Spontaneous creation of almost scale-free density perturbations in an inflationary universe. J.M.Bardeen (Dept. of Phys., Univ. of Washington, Seattle, WA, USA), P.J.Steinhardt, M.S.Turner.
Phys. Rev. D (USA), vol.28, no.4, p.679-93 (15 Aug. 1983).
The creation and evolution of energy-density perturbations are analyzed for the 'new inflationary universe' scenario proposed by Linde (1982), and Albrecht and Steinhardt (1982). According to the scenario, the Universe underwent a strongly first-order phase transition and entered a 'de Sitter phase' of exponential expansion during which all previously existing energy-density perturbations expanded to distance scales very large compared to the size of our observable Universe. The existence of an event horizon during the de Sitter phase gives rise to zero-point fluctuations in the scalar field ϕ, whose slowly growing expectation value signals the transition to the spontaneous-symmetry-breaking (SSB) phase of a grand unified theory (GUT). When a fluctuation reenters the horizon (radius$\simeq H^{-1}$) during the Friedmann-Robertson-Walker (FRW) phase that follows the exponential expansion, it has a perturbation amplitude $\delta\rho/\rho|_H=(4 \text{ or } {}^2/_5)H\Delta\phi/\dot{\phi}(t_1)$, where H is the Hubble constant during the de Sitter phase (H^{-1} is the radius of the event horizon), $\dot{\phi}(t_1)$ is the mean value of $\dot{\phi}$ at the time (t_1) that the wavelength of the perturbation expanded beyond the Hubble radius during the de Sitter epoch, $\Delta\phi$ is the fluctuation in ϕ at time t_1 on the same scale, and 4 (${}^2/_5$) applies if the Universe is radiation (matter) dominated when the scale in question reenters the horizon. Scales larger than about 10^{15}-$10^{16} M_\odot$ reenter the horizon when the Universe is matter dominated. Owing to the Sachs-Wolfe effect, these density perturbations give rise to temperature fluctuations in the microwave background which, on all angular scales $\gg 1°$, are $\delta T/T \simeq ({}^1/_5)H\Delta\phi/\dot{\phi}(t_1)$. The value of $\Delta\phi$ expected from de Sitter fluctuations is $O(H/2\pi)$. For the simplest model of 'new inflation', that based on an SU(5) GUT with Coleman-Weinberg SSB, $\dot{\phi}(t_1) \ll H^2$ so that $\delta T/T \gg 1$—in obvious conflict with the large-scale isotropy of the microwave background. One remedy for this is a model in which the inflation occurs when $\dot{\phi}(t_1) \gg H^2$. The authors analyze a supersymmetric model which has this feature, and show that a value of $\delta\rho/\rho|_H \simeq 10^{-4}$-$10^{-3}$ on all observable scales is not implausible. (24 refs.)

04.60 QUANTUM THEORY OF GRAVITATION

105202 Interaction radius and strong gravity. S.Biswas, L.Das, M.Mukhopadhyaya (Dept. of Phys., Univ. of Kalyani, Kalyani, India).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.8, p.877-88 (1983).
The role of interaction radius in the understanding of hadronic interaction is analysed in the light of strong gravity theory. Source with finite extension leads the authors to identify the radius as Schwarzchild radius. 'Hawking miracle' is seen in the light of the authors approach resulting in Regge-like relations and Hagedorn's (1970) hadronic temperature is obtained with correct range of magnitude. Success of various models like geometrodynamics of Preparata (1976) tunneling model of Schrempp and Schrempp (1977) and strong gravity theory of Salami (1975), Wess and Zumino (1979) are understood in the light of the role played by interaction radius. (19 refs.)

105203 Geometrical description of BRS and anti-BRS transformations for the gravitational fields. H.Kikugawa (Lab. of Engng. Oceanography, Univ. of Kagoshima, Kagoshima, Japan), J.Kikugawa.
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1835-6 (June 1983).
The BRS and anti-BRS transformations for the gravitational fields are derived from the heuristic geometrical considerations with the aid of the Hirayama-Hirano (1982) condition. (5 refs.)

04.65 SUPERGRAVITY

105204 Relation between different auxiliary field formulations of $N=1$ supergravity coupled to matter. S.Ferrara, L.Girardello, T.Kugo, A.Van Proeyen (CERN, Geneva, Switzerland).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.191-217 (15 Aug. 1983).
The authors establish the connection between the old minimal set of auxiliary fields, the new minimal set and the Breitenlohner set (1977) show that the class of interactions which can be described by the latter two sets are particular cases of the interactions described in the old minimal set. The old and new minimal sets of auxiliary fields are equivalent for R-symmetric lagrangians. The precise correspondence of the bosonic part of the lagrangians in the two minimal formulations is exhibited. In particular, this equivalence shows that one can have both a Fayet-Iliopoulos term (1974) and spontaneously broken supersymmetry with vanishing cosmological constant. (23 refs.)

105205 Still on the non-minimal versions of $N=1$ supergravity. V.O.Rivelles (Dept. de Fisica, Univ. Federal da Paraiba, Joao Pessoa, Brazil), J.G.Taylor.
J. Phys. A (GB), vol.16, no.13, p.3019-22 (11 Sept. 1983).
The authors show that a recently found non-minimal version of $N=1$ Poincare supergravity with (28+28) degrees of freedom is reducible to the non-minimal Breitenlohner set, in agreement with an earlier result that there exist

at most five irreducible versions with auxiliary fields of spin up to one. (17 refs.)

105206 On the reducibility of the new non-minimal sets of auxiliary fields for $N=1$ supergravity. V.O.Rivelles (Dept. de Fisica, Univ. Federal da Paraiba, Joao Pessoa, Brazil), J.G.Taylor.
J. Phys. A (GB), vol.16, no.13, p.3023-5 (11 Sept. 1983).
If a new criterion of reducibility for auxiliary field sets is employed, the authors show that the two new non-minimal sets for $N=1$ supergravity are reducible. (16 refs.)

105207 An irreducible representation of $N=4$ SUSY with two central charges. G.R.J.Bufton, J.G.Taylor (Dept. of Maths., King's Coll., London, England).
J. Phys. A (GB), vol.16, no.13, p.3027-35 (11 Sept. 1983).
Using a method of dimensional reduction from an on-shell multiplet in ten space-time dimensions the authors give the supersymmetry transformation laws of a general irreducible representation of $N=4$ SUSY with central charges present. With more than one central charge an extra condition is used to give a finite number of components and they give the field transformations and Lagrangian for the case of two central charges. (17 refs.)

105208 The spectrum of multiplets with two off-shells central charges. D.Gorse (Dept. of Phys., Queen Mary Coll., London, England), A.Restuccia, J.G.Taylor.
J. Phys. A (GB), vol.16, no.13, p.3037-47 (11 Sept. 1983).
The authors analyse the spectrum of multiplets with two central charges which vanish on-shell, and show that the general spin-reducing constraint still leaves an infinite number of propagating modes of the same mass. They perform an analysis by deriving field equations from actions involving integration over the central charge dimensions. The implications of the results for bypassing the $N=3$ barrier are briefly considered. (26 refs.)

105209 Some new extrema of the scalar potential of gauged $N=8$ supergravity. N.P.Warner (California Inst. of Technol., Pasadena, CA, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.169-73 (25 Aug. 1983).
Five new critical points are found for the scalar potential of gauged $N=8$ supergravity. These comprise a complete list of all the extrema which induce a symmetry breaking of SO(8) to some smaller group containing SU(3). Possible relationships between solutions based on these extrema and dimensional reduction schemes are suggested. One of the new extrema may have phenomenological significance since it breaks SO(8) to SU(3)×U(1) and has gauged $N=2$ supersymmetry. (13 refs.)

105210 The ghost spectrum of supergravity is not OSp(4/2) supersymmetric. J.Thierry-Mieg (Groupe d'Astrophys. Relativiste, CNRS, Obs. de Meudon, Meudon, France).
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.36-8 (15 Sept. 1983).
All spinorial representations of OSp(m,n) have vanishing superdimension. Therefore, in contradistinction with the theories of Yang-Mills, gravitation and gauge tensors, the Faddeev-Popov ghost spectrum of supergravity is not OSp(4,2) supersymmetric. (15 refs.)

105211 Compactification of $d=11$ supergravity on $K3\times T^3$. M.J.Duff, B.E.W.Nilsson, C.N.Pope (Center for Theoretical Phys., Univ. of Texas, Austin, TX, USA).
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.39-42 (15 Sept. 1983).
When $d=11$ supergravity spontaneously compactifies to $d=4$, the number of unbroken supersymmetries, $0\leq N\leq 8$, is determined by the holonomy group, $\mathcal{H}$, of the $d=7$ ground-state connection. The authors present a new solution: Minkowski spacetime$\times K3\times T^3$, for which $\mathcal{H}=SU(2)$ and $N=4$. The massless sector in $d=4$ is given by $N=4$ supergravity coupled to 22 $N=4$ vector multiplets. Aside from its intrinsic interest, this example throws new light on Kaluza-Klein supergravity. In particular, they note that the 192+192 massless degrees of freedom obtained from $K3\times T^3$ exceed the 128+128 of the $N=8$ theory obtained from T^7 or S^7. (14 refs.)

04.80 EXPERIMENTAL TESTS OF GENERAL RELATIVITY AND OBSERVATIONS OF GRAVITATIONAL RADIATION

105212 The limiting accuracy of measurement of the second derivatives of the gravitational potential. V.S.Nazarenko (P.K. Shternberg State Astron. Inst., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.29-35 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.26-32 (1982).
The author considers the static, dynamic and modulation methods of measurement of the second derivatives of the gravitational potential by using a high-quality mass-quadrupole oscillator. It is assumed that the useful signal is masked by the noise of the displacement indicator, or by the Brownian oscillations of the oscillator. Algorithms are presented for the analysis of the output signals which correspond to the method of maximum of a probability function, and formulae are obtained for the dispersion of estimates of the second derivatives of the potential, i.e. for the instrumental and thermal limits of accuracy of various methods of measurements. (3 refs.)

105213 Interferometric detectors for gravitational radiation. R.W.P.Drever (California Inst. of Technol., Pasadena, CA, USA).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.321-38
Most of the experiments aimed at the detection of gravitational radiation carried out to date have employed resonant bar gravity wave detectors, in which changes in longitudinal vibration of a suspended metal bar, due to the apparent differential action of the gravity wave on the material towards the ends of the bar, are sought. An alternative approach, in which changes in the relative motions of two or more widely separated and nearly free test masses are monitored using laser interferometry, is now being developed in several laboratories. The authors outline some of the principles and ideas behind these laser interferometer gravitational wave detectors, and also some possibilities for further development of these techniques which seem interesting for future experiments. (15 refs.)

105214 Resonant bar detectors for gravitational waves. D.G.Blair (Dept. of Phys., Univ. of Western Australia, Nedlands, Australia).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.339-85
The author presents the work done so far, the methods, the problems and prospects, as applied to the present generation of cryogenic 'Weber bar' antennae for gravitational waves. (49 refs.)

105215 Gravitational antennae Weber type: the problem of high sensitivity. V.B.Braginsky (Dept. of Phys., Moscow State Univ., Moscow, USSR).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.387-98
The author describes the main problems, which are to be solved to realize very sensitive gravitational antenna of Weber type, to estimate the level of sensitivity which may be obtained within a few years, basing on the program developed in the Department of Physics at Moscow State University. (28 refs.)

105216 The low temperature gravitational wave detector at Stanford University. P.F.Michelson (Phys. Dept., Stanford Univ., Stanford, CA, USA).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.465-74
The sensitivity of a 4800 kg cryogenic resonant mass gravitational radiation detector operated at Stanford University is discussed. The RMS noise level at the output of the detector corresponds to a dimensionless strain sensitivity of 10^{-18}. The observed noise level has been used to establish a new observational upper limit on the flux of 1 kHz gravity wave bursts. (19 refs.)

105217 Discussion on optical detectors of gravitational radiation. A.Brillet (Lab. de l'Horloge Atomique, Faculte des Sci., Orsay, France), P.Tourrenc.
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.475-84
In the prospect of defining a project for building a gravitational wave antenna in France, the authors report on a preliminary study consisting in the comparison between active and passive interferometers and in the evaluation of a 'spectroscopic' detection technique. They discuss the design of a wideband antenna whose sensitivity would be large enough to detect gravitational bursts resulting from star collapses as far as the Virgo cluster. According to the available theoretical estimates, these events would produce gravitational waves of amplitude $h=310^{-21}$ to 310^{-24} Hz$^{-1/2}$ on earth, with a spectrum extending from 0 to a few KHz. They take a pessimistic value $h=310^{-24}$ Hz$^{-1/2}$ as a basis for the following discussion. At first sight active devices display less problems in optics and electronics than the passive ones. But, on the other hand, extra noises arise from the medium. An accurate analysis is necessary to know whether these extra noises are negligible or not. They summarize this analysis. They also consider a spectroscopic detector of gravitational radiations. In such an antenna, several difficulties displayed by interferometers do not appear (seismic isolation, laser frequency stability). A proposal was made a few years ago and is still discussed. Unfortunately it was not completely convincing on the theoretical level, moreover no analysis was performed of the signal to noise ratio. The authors study the question and give a conclusion concerning earth bound experiments. (13 refs.)

105218 Electromagnetically-tracked free-mass gravitational wave antennas. R.W.Hellings (Jet Propulsion Lab., Pasadena, CA, USA).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.485-93
The response to a gravitational wave of two free masses whose relative motion is monitored with an electromagnetic tracking signal is derived. The results indicate a two-feature signature in one-way data and a three-feature signature in two-way data. The effect is applied to gravitational wave experiments using laser interferometers, spacecraft Doppler tracking, planetary ranging, and pulsar timing analysis. Actual results are presented from spacecraft Doppler experiments and from pulsar timing data analysis, with new upper limits being set on a possible cosmic gravitational wave background via the pulsar data. (5 refs.)

105219 A simple linear model for gravity wave detector analysis. W.G.Unruh (Dept. of Phys., Univ. of British Columbia, Vancouver, BC, Canada).
Gravitational Radiation. NATO Advanced Study Institute, Les Houches Summer School, France, 2-21 June 1982 (Amsterdam, Netherlands: North-Holland 1983), p.495-503
A simple linear model for a gravity wave detector and readout system is presented. This model, using a massless scalar field in one dimension as the readout system, contains the essential feature of giving the readout system an infinite number of degrees of freedom, is exactly solvable in the Heisenberg representation and demonstrates quantum non-demolition measurement by readout state preparation. (6 refs.)

05.00 STATISTICAL PHYSICS AND THERMODYNAMICS

(see also 02.50 Probability theory, stochastic processes, and statistics)

05.20 STATISTICAL MECHANICS

105220 Broken ergodicity. R.G.Palmer (Dept. of Phys., Duke Univ., Durham, NC, USA).
Adv. Phys. (GB), vol.31, no.6, p.669-735 (Nov.-Dec. 1982). [received: Sept. 1983]
The breakdown of ergodic behaviour is discussed as a general phenomenon in condensed matter physics. Broken symmetry is a particular case of this broken ergodicity. In a system that is nonergodic on physical timescales the phase point is effectively confined in one subregion or component of phase space. Theoretical treatments of such systems should compute thermal averages over one component at a time. The probability distribution of physical properties can then be obtained from occurrence probabilities for different components, and moments of these distributions may be used for predicting

the results of typical measurements. A two-level statistical mechanics is therefore proposed. Various aspects of the breakdown of ergodicity are discussed, including: the definition of components; mechanisms for the confinement of components; methods for computing the properties of one component; the choice of occurrence probabilities for different components; and average thermodynamic properties of broken ergodicity systems. The theory is illustrated by application to well-understood systems. It is also applied to the spin glass, which is reviewed in some detail. The broken ergodicity viewpoint is combined with a suggested characterization of the components in a spin glass, involving a bifurcation cascade. Together these provide a qualitative explanation for the irreversibility signature, the long time decays, the apparent failure of linear response theory and Maxwell relations and blocking. (106 refs.)

105221 Rigorous calculation of the microcanonical distribution function for the nonintegrable Barbanis Hamiltonian. R.Caboz, P.Poletti (Inst. Univ. de Recherche Sci., Pau, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.21, p.1633-6 (13 June 1983). In French.
The authors give for the nonintegrable Barbanis (1966) hamiltonian the microcanonical distribution function Z expressed in the form of a hypergeometric function of Gauss. Generalizing the above result the microcanonical mean of $q_1^{\alpha}q_2^{\beta}p_1^{\gamma}p_2^{\delta}$($\alpha$, β, γ and δ integers ≥ 0) as a ratio of two hypergeometric functions is obtained. This led the authors to transform the invariant $H=E$ into an identity between five hypergeometric functions. (15 refs.)

105222 Hamiltonian formulation of the evolution of movements over clusters of noninteracting particles. M.Andrews (Dept. of Theoretical Phys., Australian Nat. Univ., Canberra, Australia).
J. Phys. A (GB), vol.16, no.13, p.2961-6 (11 Sept. 1983).
The study of the evolution of the moments over a cluster of identical classical particles without mutual interactions is extended to the case where the motion of each particle is described by an arbitrary Hamiltonian. In the case of moments of the second and third order and ignoring contributions from moments higher than the third, differential equations are derived for the moments as well as explicit expansions. A distinction is made between the evolution of moments relative to the centroid and that of moments relative to a particle with initial position and velocity equal to those of the centroid. Although the former moments are more directly applicable and are independent of the choice of initial time, the latter have formal advantages. It is shown that these two types of moments differ in terms of order not less than four. (5 refs.)

105223 Field-theoretic study of the nonlinear Fokker-Planck equation. A.Munoz Sudupe, R.F.Alvarez-Estrada (Dept. de Fisica Teorica, Facultad de Ciencias Fisicas, Univ. Complutense, Madrid, Spain).
J. Phys. A (GB), vol.16, no.13, p.3049-64 (11 Sept. 1983).
A new field-theoretic formulation of the Fokker-Planck approach to nonequilibrium statistical mechanics is presented. Starting with the nonlinear functional Fokker-Planck equation, a new generating functional is derived. No use of auxiliary conjugate fields or response functions is needed. The Feynman rules are deduced, and the renormalisation of the theory is carried out. Finally, the renormalisation group equation is solved, and scaling laws and critical exponents are calculated, which are in good agreement with previous results obtained through different formalisms. (22 refs.)

105224 Algebraic invariants in soluble models. M.T.Jaekel (Lab. de Phys. Theorique, Ecole Normale Superieure, Paris, France), J.M.Maillard.
J. Phys. A (GB), vol.16, no.13, p.3105-17 (11 Sept. 1983).
Exhibits, on the known solutions of the triangle relation for the exactly solved models, some simplifying methods of recovering their parametrisation in terms of algebraic varieties. The relation to the automorphy group, generated by the inverse and spatial symmetries of the model, is also analysed. (19 refs.)

105225 Periodicity of classical ground states. C.Radin (Math. Dept., Univ. of Texas, Austin, TX, USA), L.S.Schulman.
Phys. Rev. Lett. (USA), vol.51, no.8, p.621-2 (22 Aug. 1983).
A model of classical particles in one space dimension with an elementary length and general finite-range interaction with hard core is considered. It is shown that such a model must have a periodic ground state. (18 refs.)

105226 On various approaches to macrodescription based on the Fokker-Plank equation. M.Yu.Tseitlin.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1251-6 (Aug. 1983). In Russian.
The Fokker-Plank equation is used as an evolution equation for the microscopic distribution function, which makes it possible to analyze in detail many suppositions of the theory of irreversible processes. (9 refs.)

05.30 QUANTUM STATISTICAL MECHANICS

(see also 67. Quantum fluids, and 71. Electron states in condensed matter)

105227 On the relativistic partition function of ideal gases. Yu.M.Sinyukov (State Standards Committee, Moscow, USSR).
Phys. Lett. B (Netherlands), vol.127B, no.6, p.443-7 (11 Aug. 1983).
The covariant partition function method for ideal Boltzmann and Bose gases is developed within quantum field theory. This method is a basis to describe the statistical and thermodynamical properties of the gases in canonical, grand canonical and pressure ensembles in an arbitrary inertial system. It is shown that when statistical systems are described relativistically it is very important to take into account the boundary conditions. This is due to the fact that an equilibrium system is not closed mechanically. The results may find application in hadron physics. (10 refs.)

105228 New approach to the one-particle Green's function for finite Fermi systems. J.Schirmer, L.S.Cederbaum, O.Walter (Lehrstuhl fur Theoretische Chem., Univ. Heidelberg, Heidelberg, Germany).
Phys. Rev. A (USA), vol.28, no.3, p.1237-59 (Sept. 1983).
A new approach to the one-particle Green's functions $\underline{G}$ for finite electronic systems is presented. This approach is based on the diagrammatic perturbation expansions of the Green's function and of the dynamic self-energy part $\underline{M}$ related to $\underline{G}$ via the Dyson equation. The exact summation of the latter expansion is reformulated in terms of a simple algebraic form referred to as algebraic diagrammatic construction (ADC). The ADC defines in a systematical way a set of approximation schemes (*n*th-order ADC schemes) that represent infinite partial summations for $\underline{M}$ and (via the Dyson equation) for $\underline{G}$ being complete through *n*th order or perturbation theory. The corresponding mathematical procedures are essentially Hermitian eigenvalue problems in restricted configuration spaces of unperturbed ionic configurations. Explicit equations for the second-, third-, and fourth-order ADC schemes are derived and analyzed. While the second- and third-order schemes can be viewed as systematic rederivations of previous approximation schemes, the fourth-order ADC scheme represents a complete fourth-order approximation for the self-energy and the one-particle Green's function which was hitherto not available. (37 refs.)

105229 Quantum statistics of parametric oscillation. K.J.McNeil (Dept. of Phys., Univ. of Auckland, Auckland, New Zealand), C.W.Gardiner.
Phys. Rev. A (USA), vol.28, no.3, p.1560-6 (Sept. 1983).
The authors present a quantum-statistical analysis of the steady-state light fields in driven parametric oscillation in a cavity. Using the solution of a Fokker-Planck equation for the generalized *P* representation of the signal and idler modes, they calculate the mean photon numbers, second-order correlation functions, and intermode correlation function as functions of the driving field. The generalized *P* distribution describes the signal and idler modes' statistics over the whole range of driving-field strengths except in the region far below the oscillation threshold. The second-order correlation functions are found to violate the Cauchy-Schwartz inequality, a violation allowed because the *P* distribution is complex. Squeezing is also found in a linear combination of the signal and idler fields. (20 refs.)

105230 Renormalization theory of the interacting Bose fluid. R.J.Creswick, F.W.Wiegel (Dept. of Appl. Phys., Twente Univ. of Technol., Enschede, Netherlands).
Phys. Rev. A (USA), vol.28, no.3, p.1579-86 (Sept. 1983).
The authors derive an approximate closed form for the infinitesimal generator of the renormalization group for the interacting Bose fluid. The Bose-condensed phase is treated by the method of Bogoliubov, and a simple scaling law is found for the condensate density. It is shown that the quantum-mechanical features are irrelevant close to the λ line. This is demonstrated by calculating the critical behavior in $4-\epsilon$ dimensions to order ϵ. (21 refs.)

105231 Model for relativistic Bose systems in *d* dimensions. V.V.Dixit (Dept. of Phys., Univ. of the West Indies, Kingston, Jamaica), D.E.Miller.
Phys. Rev. A (USA), vol.28, no.3, p.1709-16 (Sept. 1983).
The authors consider a model for the relativistic Bose gases with certain forms of the energy spectra in *d* spatial dimensions. First they discuss how some of the effects of the interactions can be brought into the energy spectra for independent particles. The thermodynamical properties arising from the energy spectra are calculated with particular attention to the spatial dependence of Bose-Einstein condensation. Then the authors explicitly interpret some special cases of the energy spectra through Fourier transformation to the usual coordinate-dependent potentials. (16 refs.)

105232 Scaling and universality of thermodynamics and correlations of an ideal relativistic Bose gas with pair production. S.Singh, P.N.Pandita (Dept. of Phys., North-Eastern Hill Univ., Shillong, Meghalaya, India).
Phys. Rev. A (USA), vol.28, no.3, p.1752-61 (Sept. 1983).
An ideal relativistic Bose-gas model with pair production is solved exactly in *d* dimensions. The critical behaviour is shown to be the same as the usual nonrelativistic Bose gas. Scaling functions (including nonuniversal parameters) for the equation of state and the correlation functions are obtained in a closed form. The scale-factor universality is verified by the formation of the expected universal ratios. Various limiting cases of the model depending on the relative magnitudes of the three basic length scales, i.e. Compton wavelength, thermal wavelength, and interparticle distance are discussed. In these limiting cases, previously known results are recovered, wherever these are available. (24 refs.)

105233 Holstein-Primakoff theory for many-body systems. L.R.Mead, N.Papanicolaou (Dept. of Phys., Washington Univ., St. Louis, MO, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1633-6 (1 Aug. 1983).
The authors discuss the relationship between generalized coherent states and suitable extensions of the Holstein-Primakoff theory of quantum spin systems illustrating the common origin of a variety of semiclassical approximation schemes encountered in many-body theory. (14 refs.)

05.40 FLUCTUATION PHENOMENA, RANDOM PROCESSES, AND BROWNIAN MOTION

105234 Stochastic Korteweg-de Vries equation. M.Wadati (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2642-8 (Aug. 1983).
The Korteweg-de Vries equation with external noise is studied. It is shown that a soliton under Gaussian noise satisfies a diffusion equation in transformed coordinates. The deformation of the soliton during propagation is explicitly obtained. The phenomenon is designated as the diffusion of the soliton.

105235 Stochastic solution method of the master equation and the model Boltzmann equation. K.Nanbu (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2654-8 (Aug. 1983).
The author describes the stochastic solution method of two integro-differential equations for probability density; one is the master equation appearing in the theory of stochastic processes and the other is the Kac model of the Boltzmann equation. The basic idea of the method is in that a set of mutually independent random variables sampled from the probability density can take the place of the role of the probability density function. A few examples are calculated. When the exact solution is known, it is ascertained that the solution obtained from the stochastic solution method agrees with the exact solution.

105236 Note on a paper by G. Rowlands [chaotic trajectories of ordinary differential equations]. A.C.Fowler (Dept. of Math., MIT, Cambridge, MA, USA).
J. Phys. A (GB), vol.16, no.13, p.3139-43 (11 Sept. 1983).
This note discusses the possible use of perturbation methods in studying chaotic trajectories of ordinary differential equations, with particular focus on a recent paper on this topic by Rowlands (ibid., vol.16, p.585, 1983). (24 refs.)

105237 Radiation balance and the stochastic Van der Pol-Duffing equation. S.M.Moore (Dept. de Fisica, Univ. de los Andes, Bogota, Colombia).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.14, p.490-4 (6 Aug. 1983).
The Van der Pol-Duffing equation with additive Gaussian noise is treated as a radiation problem by equating the noise with a stochastic electromagnetic field. If one defines the free spectrum of this field to be that for which the anharmonic terms are zero, then the hypothesis of radiation balance forces a change in the free spectrum. The magnitude of this change to first-order in the anharmonic coupling constant is calculated. (6 refs.)

105238 An integral of the triplet distribution function of a simple fluid in thermal equilibrium. B.U.Felderhof (Inst. fur Theoretische Phys., Rheinisch-Westfaelisches Tech. Hochschule Aachen, Aachen, Germany).
Physica A (Netherlands), vol.120A, no.1-2, p.103-15 (1983).
The author derives some properties of the triplet distribution function of a simple fluid in thermal equilibrium. The exact second equation of the Yvon-Born-Green hierarchy is used to express a wavenumber-dependent integral of the triplet distribution function in terms of the pair-correlation function. The integral is studied in some detail for a system of hard spheres. It is shown that there is a simple relation to the effective diffusion coefficient of a suspension of interacting Brownian particles. (17 refs.)

105239 Approximate solution methods for linear stochastic difference equations. II. Inhomogeneous equations, multi-time averages, biological application. J.B.T.M.Roerdink (Inst. for Theoretical Phys., Utrecht, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.153-77 (1983).
For pt.I see ibid., vol.119, p.455 (1983). The cumulant expansion for linear stochastic difference equations introduced in part I is applied to the general case, where the equation contains multiplicative, additive and initial value terms which are all random and statistically interdependent. Also the two-time correlation functions of the solution are discussed. Finally the expansion for the probability density functions is studied. In the case that the coefficient matrix constitutes a Markov process, an exact equation for the joint probability density function of the solution of the difference equation and the random coefficient matrix is derived. From this equation the moments of the solution can be obtained in a simple way. As an application the author considers the growth of a biological population with two age classes in a random environment, which itself is modelled by a two-state Markov chain. The exact results are compared with those of the cumulant expansion and with previous findings of Tuljapurkar. (10 refs.)

105240 Behaviors of generalized random walks. The model and its evaluations. H.Hara, H.Sato (Dept. of Engng. Sci., Tohoku Univ., Sendai, Japan).
Physica A (Netherlands), vol.120A, no.1-2, p.351-66 (1983).
Behaviors of the generalized random walks (GRW) are directly studied by using a computer. The GRW have a nonlinear term yielding a nonMarkovian character. The nonMarkovian character represents memory effects in the processes through the jumping probabilities $\tilde{P}_N^{\alpha}(m|m-\alpha 1)$ between sites $m-\alpha 1$ and m at Nth step. In the computations, the probability that the walker starting at origin arrives at site m after N steps, $W(m,N)$, is plotted by varying three parameters. The three parameters specify the jumping probabilities and the memory effects. Furthermore, the $\tilde{P}_N^{\alpha}(m|m-\alpha 1)$s are numerically evaluated from the $W(m,N)$. The $W(m,N)$ is compared with the corresponding probability density $w(x,t)$ obtained by taking the continuous limit. (19 refs.)

105241 Random walks on pseudo-lattices. B.D.Hughes, M.Sahimi, H.T.Davis (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA).
Physica A (Netherlands), vol.120A, no.1-2, p.515-36 (1983).
The problem of a Polya (unbiased, nearest-neighbor stepping) random walk is solved for several pseudo-lattices related to the Bethe lattice (Cayley tree). In each case, the solution is derived by projecting the walk on a pseudo-lattice onto a walk on a linear chain with internal states and a point defect. Random walk statistics exhibited explicitly include the probability of return to the starting point, the mean time to return if return does occur, and the asymptotic behaviour of the expected number of distinct sites visited in a walk of long duration. Conjectured relationships between random walk statistics and percolation theory are discussed in the context of pseudo-lattices. (18 refs.)

105242 On the spectral properties of dynamical systems in the transition region from order to chaos. V.V.Beloshapkin, G.M.Zaslavskii (L.V. Kirenskii Inst. of Phys., Acad. of Sci., USSR).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.121-4 (22 Aug. 1983).
Computer and qualitative analyses lead both to the formula for the frequency spectrum width and the central peak occurrence in the region of transition from order to chaos for a standard mapping system. (13 refs.)

105243 The time scale of Monte Carlo experiments. U.Larsen (Phys. Lab. I, H.C. Orsted Inst., Univ. of Copenhagen, Copenhagen, Denmark).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.147-9 (22 Aug. 1983).
The time required to reach equilibrium in a standard Monte Carlo experiment is estimated on the basis of exact bounds on the longest time scale in one-dimensional models. The result implies the empirical law of Arrhenius at low temperatures if there are energy barriers. (5 refs.)

105244 Stochastic quantization method in operator formalism. M.Namiki, Y.Yamanaka (Dept. of Phys., Waseda Univ., Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1764-93 (June 1983).
The stochastic quantization method is developed in a possible 'Heisenberg' operator theory of stochastic processes. The general theory is first formulated for stochastic processes of the Wiener type and then its application to quantization of boson fields is presented. It seems that the operator formalism is convenient to examine implications of the stochastic quantization method. Within the theoretical framework the authors develop the 'Feynman-Dyson' approach to field propagators in the perturbation theory. This approach enables one to simplify and systematize practical calculations in comparison with the Langevin equation method. They formulate the Green function approach to field propagators using the characteristic functional. (6 refs.)

105245 Doubling of torus. K.Kaneko (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1806-10 (June 1983).
'Doubling of torus' is found in three- or four-dimensional dissipative mappings. In these models, doubling occurs only a finite number of times before chaos appears. An explanation is attempted by a numerical study on the stability against perturbation of the direct product state of coupled logistic and torus maps. (15 refs.)

105246 Origin of long-time tails in strongly chaotic systems. F.Vivaldi (School of Phys., Georgia Inst. of Technol., Atlanta, GA, USA), G.Casati, I.Guarneri.
Phys. Rev. Lett. (USA), vol.51, no.9, p.727-30 (29 Aug. 1983).
The behavior of autocorrelation functions in a K system (the stadium billiard) is studied, and the existence of long-time tails is demonstrated both analytically and numerically. The tails are shown to depend on the presence of arbitrary long segments of regular motion in the time evolution of the stochastic orbits. It is surmised that an analogous mechanism might be responsible for long-time tails in a large class of systems. (10 refs.)

105247 Dynamic scaling function for critical fluctuations in classical fluids. H.C.Burstyn, J.V.Sengers, J.K.Bhattacharjee, R.A.Ferrell (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1567-78 (Sept. 1983).
A closed-form approximant is proposed for the dynamic scaling function that characterizes the behavior of the wave-number-dependent diffusion of the order-parameter fluctuations in a fluid near a critical point. The expression contains two parameters that determine the expected behavior of the diffusion coefficient in the hydrodynamic and in the nonlocal critical limits. The proposed scaling function yields an accurate representation of the authors' recent experimental data for the 3-methylpentane and nitroethane mixture near the critical mixing point with parameter values that are in good agreement with the values predicted from theory. (53 refs.)

105248 Universal scaling property in bifurcation structure of Duffing's and of generalized Duffing's equations. S.Sato, M.Sano, Y.Sawada (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).
Phys. Rev. A (USA), vol.28, no.3, p.1654-8 (Sept. 1983).
Computer calculation for the numerical solution of Duffing's and generalized Duffing's equations shows global scale properties for the bifurcation in parameter space. These scaling properties are discussed in terms of a one-dimensional map. The analysis based on a piecewise linear approximation gave results in good agreement with the experimentally observed scaling behavior. (17 refs.)

105249 Instability and irregular behavior of coupled logistic equations. Jian-Min Yuan, Mingwhei Tung, Da Hsuan Feng, L.M.Narducci (Dept. of Phys. & Atmospheric Sci., Drexel Univ., Philadelphia, PA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1662-6 (Sept. 1983).
The authors analyze some general features of two models of coupled logistic equations. They find that, for selected values of the three control parameters, chaotic patterns may emerge out of an infinite sequence of period-doubling bifurcations. However, there exist large regions of control-parameter space where the approach to irregular behavior appears to be consistent with the Newhouse-Ruelle-Takens scenario, as evidenced by the appearance of two characteristic frequencies. As the ratio of these frequencies is varied, by changing the control parameters, phase locking and quasiperiodic motion are observed on the way to chaos. (8 refs.)

105250 Exact solution of some discrete stochastic models with chaos. R.Graham (Fachbereich Phys., Univ. Essen, Essen, Germany).
Phys. Rev. A (USA), vol.28, no.3, p.1679-91 (Sept. 1983).
A class of two-dimensional maps with sensitive dependence on initial conditions introduced by Kaplan and Yorke (1979) is studied, including the influence of external noise. Exact solutions of the stochastic equations of motion are obtained and used to calculate moments, correlation functions and probability densities. The relation of the steady-state probability density and the attractor of the maps is considered. The models are also used to test the applicability of other methods of solution from the theory of stochastic processes. (10 refs.)

105251 Crossover in diffusion-limited aggregation. M.Nauenberg (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), R.Richter, L.M.Sander.
Phys. Rev. B (USA), vol.28, no.3, p.1649-51 (1 Aug. 1983).
The authors consider a generalization of the Witten-Sander model for aggregation to allow for a finite density of diffusing particles. In a continuum treatment they show that for small aggregates they recover the previous behavior that the density of the aggregate decreases inversely with the radius, but larger aggregates cross over to having constant density. Their results are in qualitative agreement with numerical simulations of the discrete model. (8 refs.)

105252 A time-dependent stochastic model of spatial interaction: model framework and properties. R.Kitamura (Dept. of Civil Engng., Univ. of California, Davis, CA, USA), M.Hioki.
Takenaka Tech. Res. Rep. (Japan), no.29, p.89-98 (May 1983).
The study presents a stochastic process model that introduces the following two basic aspects of urban travel behaviour into spatial interaction analysis: time constraints that govern tripmakers' travel choices, and the linkages among trips made by a tripmaker. The model, which is a modification and extension of the Markov-renewal process model, allows the probability of interzonal interaction to vary as a function of time, thus incorporating the temporal factors that affect the tripmakers' spatial choices. The Markovian model structure also allows the representation of travel behaviour as a path in the time-space dimension that may involve series of linked trips. (7 refs.)

05.50 LATTICE THEORY AND STATISTICS; ISING PROBLEMS

(see also 75.10H Ising models)

105253 On the phase transition of the random bond Ising model. W.F.Wolff, J.Zittartz (Inst. fur Theoretische Phys., Univ. zu Koln, Koln, Germany).
Z. Phys. B (Germany), vol.52, no.2, p.117-26 (1983).
The random bond Ising model on a d-dimensional hypercubic lattice with nearest-neighbour couplings K and impurity couplings aK is studied by expanding the quenched averaged free energy for small concentration p of the impurities. The critical temperature and the leading singular terms of the free energy are calculated up to second order in p for arbitrary interaction parameters a. In two dimensions where the pure, $p=0$, Ising model is soluble the authors obtain explicit expressions for all relevant quantities in the expansion. The phase diagram is qualitatively different if the system contains frustration or not, i.e. if $a<0$ or $a>0$. The specific form of the leading singularities of the free energy leads to a conjecture for the scaling function which describes the crossover from the pure Ising case to the random bond model and determines the critical behaviour. This scaling function is universally the same for all impurity concentrations and independent of the particular value of the interaction parameter a. This means that it is only the disorder which universally determines the critical behaviour, i.e. the type of phase transition, while frustration ($a<0$) is very effective in reducing critical temperatures and

in destroying ordered phases, but does not change the situation qualitatively as compared with the non-frustrated case $a>0$. (31 refs.)

105254 Mean-field limits of the quantum Potts model. A.Cant, P.A.Pearce (Dept. of Theoretical Phys., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
Commun. Math. Phys. (Germany), vol.90, no.3, p.373-87 (1983).
The authors consider the q-component quantum Potts model on a d-dimensional cubic lattice with symmetry breaking and transverse fields. The model is solved exactly in two special limiting cases: 1) the infinite lattice-dimensionality ($d\to\infty$) limit and 2) the limit of infinitely-weak long-range interactions of Kac type. In each case the resulting free energy and its first partial derivatives (order parameters) are shown to be identical to the corresponding mean-field expressions. (24 refs.)

105255 Modulated structure of an Ising spin system on a triangular lattice. II. Complete devil's staircase. K.Nakanishi (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2449-58 (July 1983).
A study is made on an Ising spin system on a triangular (actually hexagonal) lattice which contains the couplings of the nearest neighbor (J_1) and the next-nearest neighbor ($J_2<0$: antiferromagnetic). A mean field approximation is employed. Infinite numbers of higher-order commensurate structures with one-dimensional modulation are shown to be stabilized at finite temperatures. Analytic calculations are performed at low temperatures to find that the model exhibits a complete devil's staircase at $J_1\gtrsim0$ and ordinary staircases with infinite steps at $J_1\lesssim0$ and $J_1\lesssim2|J_2|$. It is shown that most of the phases stabilized around $J_1=0$ are partially disordered states. Numerical calculations are also made to construct a global phase diagram. The structure of the phase diagram is discussed in terms of domain boundary. In this context the order-disorder transition of $(Nb_{1-x}Ta_x)_2C$ is compared with the theory.

105256 A fast processor for Monte-Carlo simulation. R.B.Pearson (Inst. fur Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), J.L.Richardson, D.Toussaint.
J. Comput. Phys. (USA), vol.51, no.2, p.241-9 (Aug. 1983).
A special purpose processor for Monte-Carlo simulation of the three-dimensional Ising model is described. This device performs the Monte-Carlo updating algorithm on 25 million spins per second on a 64^3 lattice. The device is also capable of measuring the energy and magnetization of the system or passing the updated lattice to a host computer. (9 refs.)

105257 Exact enumeration approach to fractal properties of the percolation backbone and $1/\sigma$ expansion. D.C.Hong, H.E.Stanley (Dept. of Phys., Boston Univ., Boston, MA, USA).
J. Phys. A (GB), vol.16, no.13, p.L475-81 (11 Sept. 1983).
An exact numeration approach is developed for the backbone fractal of the incipient infinite cluster at the percolation threshold. The authors use this approach to calculate exactly the first low-density expansion of $L_{BB}(p)$ for arbitrary system dimensionality d, where $L_{BB}(p)$ is the mean of backbone bonds and p is the bond occupation probability. Standard series extrapolation methods provide estimates of the fractal dimension of the backbone for all d; these disagree with the Sierpinski gasket model of the backbone. They also calculate the first low-density expansions of $L_{min}(p)$ and $L_{red}(p)$ which are, respectively, the mean number of bonds in the minimum path between i and j and the mean number of singly connected ('red') bonds. (24 refs.)

105258 Absorption of a self-avoiding random walker by a random trap distribution. F.Tanaka (Lab. of Phys., Tokyo Univ. of Agriculture & Technol., Tokyo, Japan).
J. Phys. A (GB), vol.16, no.13, p.L489-92 (11 Sept. 1983).
A particle performing a self-avoiding random walk is considered on a lattice in any number of dimensions d, which contains a fraction q of randomly distributed impurity sites. An impurity is assumed to trap the walker when stepped on. The author finds the average time to trapping to be $\lambda(1-q)/[q-(1-K_c)]$, where K_c and γ are the inverse critical temperature and the critical index of the susceptibility for the classical Heisenberg model of magnetism with vanishing ($n\to0$) internal degrees of freedom. (11 refs.)

105259 Renormalisation of a diffusion on an anisotropic chain. M.Napiorkowski (Inst. of Theoretical Phys., Warsaw Univ., Warsaw, Poland).
J. Phys. A (GB), vol.16, no.13, p.3065-70 (11 Sept. 1983).
A direct renormalisation method is used to calculate the index ν which characterises the mean square displacement of a walk on a one-dimensional, anisotropic, homogeneous lattice: $\langle R_n{}^2\rangle^{1/2}\sim n^\nu$ for large number of steps n. The two-parameter, exact analysis is carried out for arbitrary choice of the cell size. The results are shown to be independent of the cell size. (5 refs.)

105260 Equivalence of the void percolation problem for overlapping spheres and a network problem. A.R.Kerstein (Thermofluids Div., Sandia Nat. Labs., Livermore, CA, USA).
J. Phys. A (GB), vol.16, no.13, p.3071-5 (11 Sept. 1983).
The percolation problem for the complement of the union of randomly located, overlapping spheres is shown to be equivalent to a bond percolation problem on the edges of the Voronoi tesselation of the sphere centres. This result provides a convenient definition of cluster size, and therefore of critical exponents, for this problem. It also provides an efficient algorithm for Monte Carlo computation of the percolation threshold and the critical exponents. (12 refs.)

105261 Hierarchical lattices: some examples with a comparison of intrinsic dimension and connectivity and Ising model exponents. J.R.Melrose (Dept. of Phys., Univ. Coll. Cardiff, Cardiff, Wales).
J. Phys. A (GB), vol.16, no.13, p.3077-83 (11 Sept. 1983).
The recently recognised class of hierarchical lattices is examined through a number of examples. Definitions of length, intrinsic dimension and connectivity are made and used to discuss variations of exponents calculated on the Ising model. Generalisations of regular lattice results are found for exponents at discontinuity fixed points and in $1+\epsilon$ dimensions. (26 refs.)

105262 Latent heats from finite-size scaling. C.J.Hamer (Dept. of Theoretical Phys., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
J. Phys. A (GB), vol.16, no.13, p.3085-95 (11 Sept. 1983).
A method of obtaining the latent heat at a first-order transition from finite-lattice matrix elements is discussed, and demonstrated for the case of the $(1+1)$D Potts model. The method is shown to provide smoothly convergent finite-lattice sequences. The structure of the finite-lattice Hamiltonian eigenvalues is exhibited, and a characteristic signal of the first-order transition is proposed. The finite-size scaling behaviour at the transition is also discussed. (28 refs.)

105263 Tests of a method for estimating corrections to scaling from series. V.Privman (Baker Lab., Cornell Univ., Ithaca, NY, USA).
J. Phys. A (GB), vol.16, no.13, p.3097-103 (11 Sept. 1983).
The author studies a recently developed, Pade-type method of series analysis which allows for the leading confluent singularity. A number of properties are described and by applying the method to various test series some pitfalls of the technique are revealed. (26 refs.)

105264 Lattice trees with a restricted number of branch points. J.E.G.Lipson, S.G.Whittington (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada).
J. Phys. A (GB), vol.16, no.13, p.3119-25 (11 Sept. 1983).
The authors investigate the asymptotic behaviour of the number of trees having n vertices, weakly embeddable in the d-dimensional hypercubic lattice, with restrictions on the number (n^+) of vertices with degree greater than two. They show rigorously that if $n^+=o(n/\log n)$ the growth constant is equal to the corresponding quantity for self-avoiding walks. For n^+ increasing linearly with n they show that the growth constant still exists and present arguments indicating that it is strictly greater than that for self-avoiding walks. (16 refs.)

105265 Estimates of the site percolation probability exponents for some directed lattices. K.De'Bell (Dept. of Phys., Dalhousie Univ., Halifax, Nova Scotia, Canada), J.W.Essam.
J. Phys. A (GB), vol.16, no.13, p.3145-7 (11 Sept. 1983).
Series expansion analysis has been used to obtain estimates of the percolation probability exponent, β, for directed site percolation on the square, triangular, simple cubic and body centred cubic lattices. These estimates are consistent with those obtained by Blease (1977) for the corresponding bond problems and the results for site and bond problems on all lattices considered are summarised by $\beta=0.28\pm0.01$ ($d=2$) and $\beta=0.59\pm0.02$ ($d=3$). (4 refs.)

105266 Interdimensional scaling laws for the critical exponents of the percolation threshold. D.J.Bergman (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel).
J. Phys. A (GB), vol.16, no.13, p.3149-51 (11 Sept. 1983).
The interdimensional scaling laws of second-order phase transitions are modified so as to apply to the percolation threshold. Interesting results are obtained for some of the geometric exponents as well as for some conductivity exponents in the case of a metal-insulator or superconductor-normal conductor composite or a random resistor network. (18 refs.)

105267 Commensurate-incommensurate crossover in quantum sine-Gordon model. K.Hida (Dept. of Engng. Sci., Hokkaido Univ., Sapporo, Japan), M.Imada, M.Ishikawa.
J. Phys. C (GB), vol.16, no.25, p.4945-58 (10 Sept. 1983).
The thermodynamics of the quantum sine-Gordon model with finite winding numbers is investigated by the Bethe ansatz method. The temperature dependences of the specific heat and the winding number are calculated. The crossover from the case with the commensurate ground state to that with the incommensurate ground state is discussed. The quantum effect is shown to be significant in the thermodynamic properties of the system. (28 refs.)

105268 Site-bond disorder in the Ising model. A.R.McGurn (Dept. of Phys., Western Michigan Univ., Kalamazoo, MI, USA).
J. Phys. C (GB), vol.16, no.25, p.5023-30 (10 Sept. 1983).
A general technique is presented which allows site-bond disorder problems in Ising systems to be mapped onto a certain class of decorated lattice problems. The specific case of site-bond disorder on the honeycomb lattice is studied in detail through the use of annealed model solutions of the corresponding decoration problems. The critical temperature and magnetisation as functions of bond and site concentrations are calculated. The zero-temperature magnetisation is used to obtain an approximation to the percolocation probability of the system. (12 refs.)

105269 The critical dynamics and the real-space renormalization group. Y.Achiam (Nuclear Res. Centre, Negev, Beer-Sheva, Israel).
Physica A (Netherlands), vol.120A, no.1-2, p.279-313 (1983).
A general approach of the real-space renormalization group to critical dynamics is described: the formalism is presented and discussed. In particular, the application of this formalism to the study of the 1D kinetic Ising model and to the second order cumulant approximation of the 2D kinetic Ising model on a triangular lattice is carried out. The question of universality in the framework of the above formalism is studied, and the limitations of the method are presented. (47 refs.)

105270 Electrostatic potential at a plane surface of a point ionic crystal. E.R.Smith (Dept. of Math., Univ. of Melbourne, Parkville, Victoria, Australia).
Physica A (Netherlands), vol.120A, no.1-2, p.327-38 (1983).
The electrostatic potential near a plane surface of a plane slab shaped piece of simple cubic structured point ionic crystal is calculated as a lattice sum which is absolutely convergent. The resulting potential can be shape dependent, the shape dependent terms depending on the unit cell dipole and quadrupole moments. The representation developed shows how the potential changes from its bulk values inside the crystal to zero outside the crystal. (13 refs.)

105271 Statistics of flexible rings with excluded volume. E.S.Nikomarov (Landau Inst. for Theoretical Phys., Moscow, USSR).
Physica A (Netherlands), vol.120A, no.1-2, p.647-55 (1983).
A grand partition function of a system of closed self-avoiding lines on a lattice is studied. The examples of such lines are closed linear singularities: dislocations, vortex lines, etc. The partition function is expressed in the form of an integral over fictitious fields so that the behaviour of the whole system and a single ring in the system may be qualitatively described. A length distribution of rings, a mean radius of a ring of length L in the system and an effective interaction of the points of a probe ring, arising from the interaction of the probe ring with other rings, have been derived. An impact of broken rings is discussed. (10 refs.)

105272 Path-length dependent flux from random walk theory. K.Unnikrishnan (Low Level Counting Lab., BARC Hospital Complex, Bombay, India), M.A.Prasad.
Phys. Lett. A (Netherlands), vol.97A, no.4, p.131-2 (22 Aug. 1983).
Calculation of the flux $\Psi(R,s)$ due to a point isotropic source in an infinite medium, as a function of the distance R and actual pathlength s is treated as a random walk problem. In the case of isotropic scattering, this method is shown to lead to a standard transport-theoretical result, for the integrated flux. However, for $\Psi(R,s)$ far from the source, the random walk theory predicts a modified maxwellian form. (5 refs.)

105273 Exact solution of a directed-site animals-enumeration problem in three dimensions. D.Dhar (Tata Inst. of Fundamental Res., Bombay, India).
Phys. Rev. Lett. (USA), vol.51, no.10, p.853-6 (5 Sept. 1983).
An exact equivalence is established between the directed-site animals-enumeration (DSAE) problem in d dimensions and a crystal-growth model defined on the same lattice. In special cases, the latter reduces to the calculation of the free energy of a $(d-1)$-dimensional lattice gas with extended hard cores. The author solves a DSAE problem with $d=3$ exactly by using its equivalence to the hard-hexagon problem, and shows that the exponent $\theta={}^5/_6$. A new and simpler solution to the DSAE problem on the square and triangular lattices is given. (8 refs.)

105274 Supersymmetric dimer Hamiltonian for lattice branched polymers. Y.Shapir (Dept. of Phys., Univ. of Illinois, IL, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1893-5 (Sept. 1983).
A supersymmetric monomer-dimer Hamiltonian is constructed by the assignment of coupled commuting and anticommuting variables to each lattice site. The resulting super-Hamiltonian generates lattice branched polymer configurations. This relation holds for any value of the fugacity above the critical point and at all dimensions. Although this does not yet prove dimensional reduction beyond perturbation theory, it does provide strong support for its validity for these models in any dimension. (25 refs.)

105275 Corrections to scaling for branched polymers and gels. A.Margolina, Z.V.Djordjevic, D.Stauffer, H.E.Stanley (Dept. of Phys., Boston Univ., Boston, MA, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1652-4 (1 Aug. 1983).
The authors have extended series expansions for both lattice animals and percolation (which model branched polymers and gels, respectively), and also have obtained Monte Carlo simulations of systems 1000 times larger than hitherto studied (17 × 10^9 sites). They find more precise estimates of the corresponding 'correction-to-scaling exponents,' and calculate the 'correction-to-scaling function' $f_1(z)$ for the first time. (20 refs.)

05.60 TRANSPORT PROCESSES: THEORY

105276 A generalized diffusion equation: radial symmetries and comparison theorems. J.E.Bouillet (Inst. Argentino de Matematica, Buenos Aires, Argentina).
J. Math. Anal. & Appl. (USA), vol.95, no.1, p.37-68 (Aug. 1983). (14 refs.)

105277 Diffusion and fracton dimensionality on fractals and on percolation clusters. S.Havlin, D.Ben-Avraham (Dept. of Phys., Bar-Ilan Univ., Ramat-Gan, Israel).
J. Phys. A (GB), vol.16, no.13, p.L483-7 (11 Sept. 1983).
The authors present simulations of diffusion on an exact fractal and on percolation clusters at criticality for two and three dimensions. The results for the fractal support the Rammal and Toulouse proposition (1983) that $\mathrm{d}S(N)/\mathrm{d}N \propto B(N)/S(N)$. The results for percolation are in excellent agreement with the Alexander and Orbach conjecture (1982) that the fracton dimensionality $\bar{d}={}^4/_3$. (12 refs.)

105278 Do the higher derivatives of the *H*-function alternate in sign?. J.O.Vigfusson (Inst. fur Theoretische Phys., Univ. Zurich, Zurich, Switzerland).
Lett. Math. Phys. (Netherlands), vol.7, no.4, p.273-7 (July 1983).
The conjecture of complete monotonicity of the Boltzmann *H*-function is shown to be false for a large class of discrete master equations. (10 refs.)

105279 On the spatially homogeneous Boltzmann equation with a velocity-dependent force term. A.Corciovei, C.P.Grunfeld (Dept. of Theoretical Phys., Central Inst. of Phys., Bucharest, Rumania).
Lett. Math. Phys. (Netherlands), vol.7, no.4, p.307-12 (July 1983).
A previous result of G. di Blasio (1979), concerning the global solutions of the spatially homogeneous Boltzmann equations, for a classical gas of identical point particles in the presence of an external constant force, is extended to the case of velocity-dependent external forces. (6 refs.)

105280 Solution to diffusion equations in space distribution problems. J.Waclawik.
Mech. Teor. & Stosow. (Poland), vol.20, no.1-2, p.167-70 (1982). In Polish.
The author refers to diffusion equations and space transport problems used in the E. Bobula series of articles (1974, 1975, 1979). The critical remarks concern equations and expressions dealing with the energy stream with proposed modification to a final equation. Other remarks refer to a definition of 'density' as applied to a diffusion problem with references to classical works on heat diffusion theory. A relevant bibliography is included. (26 refs.) *T.H.*

105281 The Boltzmann equation for very hard particles. E.M.Hendriks, M.H.Ernst (Inst. for Theoretical Phys., Univ. of Utrecht, Utrecht, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.545-65 (1983).
The nonlinear Boltzmann equation is solved analytically for general initial distributions in a (spatially homogeneous) system of very hard particles (VHP) with two translational degrees of freedom and with a transition probability for binary collisions ($vw \to v'w'$) proportional to $\delta(v^2+w^2-v'^2-w'^2)$. The scattering cross-section corresponding to this model increases as the square root of the collision energy (hence the name VHP-model). As the total energy of the system is finite, essentially no highly energetic particles are present to probe the unphysical high-energy behavior of the cross-section. The VHP-model is extended to a multicomponent mixture of particles and solved by the same technique, viz. Laplace transformation. An analogous discrete variable model is solved by a generating function method. Finally the solutions of the nonlinear and linearized Boltzmann equation are compared. Their large-energy behaviour at a fixed (large) time is different; their large-time behavior at a fixed energy is the same. (13 refs.)

105282 On the $e^{-\alpha t}$ damping of the coherent memory functions. L.Skala (Faculty of Maths. & Phys., Charles Univ., Prague, Czechoslovakia).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K89-92 (1 Aug. 1983).
One of the most general approaches to the problems of the nonequilibrium statistical mechanics is based on the generalized master equation. This equation enables a description of both the so-called coherent and incoherent transport. Because of the difficulties in calculating the incoherent memory functions, the following approximate approach is frequently used. First, the coherent transport problem is solved. Then, the interaction with the bath leading to the incoherency is approximately taken into account by multiplying the coherent memory functions $K_{mn}(t)$ by the damping factor $e^{-\alpha t}$. As the damped memory functions do not in general correspond to any real physical system, the following question naturally appears: Are the probabilities $P'_m(t)$ physically reasonable at least in the sense that they lie between O and 1? The author shows that the answer is affirmative. (3 refs.)

105283 Density expansion of viscosity coefficient. A.K.Heblekar (Phys. Dept., Centre of Post-Graduate Instruction & Res., Panaji, India).
Pramana (India), vol.20, no.5, p.405-13 (May 1983).
The author obtains the density expansion of the viscosity coefficient. The important role played by the Hartree average energy in obtaining an explicit temperature dependence for the density coefficients of the viscosity is demonstrated. The results obtained are compared with the available experimental data for the first density coefficient. A satisfactory agreement between theory and experiment is found. (10 refs.)

105284 An effective conductivity of nonuniform media. A.E.Morozovskii, A.A.Snarskii.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1203-8 (Aug. 1983). In Russian.
A renormalization-group-like procedure is suggested which permits finding an effective conductivity of polycrystals and macroscopically nonuniform media, isotropic on the average for arbitrary space dimensions. The concentration dependence of the effective conductivity for stochastic mosaic is compared with numerical variational calculations for the case of three-dimensional medium. (5 refs.)

105285 On unbounded eigenvalues in particle-transport theory. C.V.M.van der Mee, C.E.Siewert (Dept. of Phys. & Astron., Free Univ., Amsterdam, Netherlands).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.4, p.556-61 (July 1983).
The dispersion function derived from particle-transport theory is analyzed for the specific case of a three-term redistribution law in order to define those $c>1$ cases for which there can be either one or two pairs of unbounded eigenvalues, and the elementary solutions corresponding to the unbounded eigenvalues are reported. (10 refs.)

105286 Maximum principle in finite element models for convection-diffusion phenomena. T.Ikeda.
Amsterdam, Netherlands: North-Holland (1983), ix+159 pp. [0 444 86506 3]
The authors present a study of finite element models for diffusion phenomena in which underlying flow is present: for instance, heat or pollutant transportation. Mathematically, these phenomena are described by convection-diffusion equations, namely, parabolic equations involving first-order derivatives in the spatial coordinates. They give a broad description of all the finite element schemes available for solving convection-diffusion equations. The emphasis is placed on a family of finite element schemes that give solutions satisfying a discrete analogy to the maximum principle. (75 refs.)

05.70 THERMODYNAMICS

(see also 44.60 Thermodynamic processes, 64. Equations of state, phase equilibria and phase transitions, 65. Thermal properties of condensed matter; for chemical thermodynamics, see 82.60)

105287 Evolution equations for dissipative bodies and hyperbolicity. A.Morro (Univ. of Genova, Genova, Italy).
Acta Mech. (Austria), vol.48, no.3-4, p.227-31 (1983).
With reference to the thermodynamics of materials with internal variables, the author proves that within the 'special case' of Navier-Stokes-Fourier theory, the invariance of internal energy and pressure in nonequilibrium leads to a hyperbolic system of equations for heat conducting and viscous fluids. (5 refs.)

105288 Generalized integral variational principles of phenomenological thermodynamics of irreversible processes, and the nature of variation of thermodynamic action. I.P.Vyrodov (Krasnodar Polytech. Inst., Krasnodar, USSR).
J. Eng. Phys. (USA), vol.44, no.1, p.99-108 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.118-29 (Jan. 1983). [received: Sept. 1983]
Generalized integral variational principles of phenomenological thermodynamics of irreversible processes (PTIP), formulated by the author, are stated. (32 refs.)

105289 Gradient operators and the commensurate-incommensurate transition. H.J.F.Knops (Inst. voor Theoretische Fysica, Katholieke Univ. Nijmegen, Nijmegen, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.116-24 (1983).
It is shown that gradients of bounded operators do not contribute to singularities in the bulk free energy. The formal scaling index of these operators describes at best, depending on the boundary conditions, singularities in the

surface free energy. This observation is used in the context of a model that describes the commensurate-incommensurate transition, to show that Cardy's argument for the renormalization connection of this transition with the point $T=1/\pi$ of the Gaussian fixed line cannot be correct. The same model is further used to demonstrate how gradients of unbounded operators can contribute to singularities in the bulk. (11 refs.)

105290 **Kinetic theory of resonance and relaxation in spin systems. III. Spin bistability phenomena.** J.Luczka (Inst. of Phys., Silesian Univ., Katowice, Poland).
Physica A (Netherlands), vol.120A, no.1-2, p.219-37 (1983).
For pt.II see ibid., vol.111, p.240 (1982). The possibility of existence of nonequilibrium phase transitions, bistability phenomena, and other critical properties of the two-level spin systems considered in the two previous papers is investigated. Under suitable assumptions, an evolution equation for the mean value of the Zeeman operator is obtained from kinetic equations derived in part I. Qualitative methods of analysis of autonomous differential equations are used to study properties of the evolution equation. Vector fields generated by this equation are analyzed. Stationary solutions and their stability are discussed. It is shown that under suitable conditions, the steady state solutions exhibit a hysteresis cycle. Time-dependent solutions of the evolution equation are presented and discussed. (27 refs.)

105291 **Statistical mechanics of two-dimensional vortex fluids or guiding center plasmas.** P.Vieillefosse (Lab. de Phys. Theorique des Liquides, Univ. Pierre et Marie Curie, Paris, France).
Physica A (Netherlands), vol.120A, no.1-2, p.609-26 (1983).
The author shows by an effective calculation of the entropy that negative temperatures do not exist in two-dimensional inviscid fluids or guiding center plasmas. The entropy is always a non-decreasing function of the energy. Its exact form depends on the behaviour of the interaction potential at large distances. (4 refs.)

105292 **Roughening behavior of a one-dimensional crystal surface with inverse square potential.** J.Slurink, H.J.Hilhorst (Lab. voor Tech. Natuurkunde, Delft, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.627-34 (1983).
The discrete Gaussian chain with inverse square potential—which models a one-dimensional crystal surface—is studied by Monte Carlo methods. The system is found to undergo a roughening transition and the temperature-dependent correlation function exponent $\eta(T)$ is shown to be discontinuous at the critical point. These results can be transposed to the metal-insulator transition of a one-dimensional plasma of logarithmically interacting charges. (8 refs.)

105293 **Time-scaling in irreversible thermodynamics.** U.Geigenmuller (Inst. Lorentz, Leiden, Netherlands), B.U.Felderhof, U.M.Titulaer.
Physica A (Netherlands), vol.120A, no.1-2, p.635-46 (1983).
The authors consider linear dynamical systems with motions characterized by two different time-scales. In practice the dynamical matrix in the phenomenological equations of motion often exhibits a strong coupling of the slow and fast variables. It is shown on the basis of the Onsager symmetry relations that a simple transformation of variables leads to a weak coupling. After the transformation one can use perturbation theory to derive reduced matrices describing the slow (fast) motions of the slow (fast) subsystem. (13 refs.)

105294 **Dynamic scaling law for a first-order phase transition.** H.Furukawa (Dept. of Phys. Sci., Yamaguchi Univ., Yamaguchi, Japan).
Phys. Rev. A (USA), vol.28, no.3, p.1717-28 (Sept. 1983).
Giving a statistical-mechanical formulation of structure-function dynamics, the author presents a formulation of a scaling law for the first-order phase transition. The basic idea proposed, which previously appeared in a specific form, is that any function of the form $F_k(t_1,t_2,...)$, where k is the wave number and $t_1,t_2,...$ are times, is scaled as $F_k(t_1,t_2,...)=[R(t_1)]^{x1}[R(t_2)]^{x2}...\tilde{F}(kR(t_1),kR(t_2),...)$, where $R(t)$ is a relevant scale length, such as a linear dimension of an average cluster size, which is found to behave as $R(t)\propto t^{1/z}$ with z being a constant. The autocorrelation function of the density fluctuation is found to obey the scaling law for the conserved system: $J_k(t,t')=[R(t)]^{\theta}[R(t')]^{d-\theta}\tilde{J}(kR(t), kR(t'))$, $\theta\leq d/2$ where d is the dimensionality. For $\theta=0$ this scaling law can be naturally derived on the basis of the dynamic-scaling assumption and the conservation law. However, for large t the possibility of an anomalous scaling law ($\theta\neq 0$) is found. On the computer simulation for the three-dimensional spin-exchange kinetic Ising model, the author examines such a scaling law for the autocorrelation function. A remarkable difference in the temporal behaviors of the autocorrelation function is found. That observation strongly suggests the existence of the spinodal-like line. (38 refs.)

105295 **Phase transitions in stationary nonequilibrium states of model lattice systems.** S.Katz, J.L.Lebowitz, H.Spohn (Dept. of Maths. & Phys., Rutgers Univ., New Brunswick, NJ, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1655-8 (1 Aug. 1983).
The authors investigate the stationary nonequilibrium states of a lattice gas of interacting particles subject to an external field $\bar{E}$. The dynamics of the system are given by hoppings of particles to nearby empty sites with rates biased for jumps in the direction of $\bar{E}$. This system is often used to model fast ionic conductors. Using computer simulations of a two-dimensional lattice with nearest-neighbor interactions the authors studied the dependence of the structure function, current, etc., on temperature and $\bar{E}$. They found evidence for a transition line in the temperature-field plane at which the system develops (anisotropic) long-range order. $\bar{E}$ enhances the transition for attractive interactions and represses it for repulsive ones. (6 refs.)

105296 **An equation of state of Lennard-Jones fluids and evaluation of some thermodynamic properties.** R.V.Gopala Rao, S.K.Dutta (Phys. Dept., Govt. Engng. Coll., Jalpaiguri, West Bengal, India).
Z. Phys. Chem., Leipzig (Germany), vol.264, no.4, p.771-7 (1983). In German.
The Lennard-Jones attractive tail is treated as a perturbation on the hard sphere potential and the direct correlation function in the long wave limit in the random phase approximation has been obtained. Using the compressibiltiy sum rule and through the direct correlation function in the long wave limit an equation of state has been formulated. Through this equation the authors derive the thermal expansion coefficient, compressibility, pressure variation of bulk modulus, the specific heat of the liquids and also their temperature variations. The critical constants have also been derived and presented. The agreement between theory and experiment in the evaluation of many of these properties shows that this forms a very important method in the formulation of equation of state. (13 refs.)

105297 **Deconvolution of noisy experimental data.** G.A.Baker,Jr., J.E.Brolley (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Comput. Phys. (USA), vol.51, no.2, p.227-40 (Aug. 1983).
For a given impulse function, which describes the influence of apparatus on a data stream, the authors deconvolved the noisy data by two procedures. The first method develops an iterative scheme that searches for a solution that simultaneously is a best least-squares fit to the data and has minimum length. The second procedure applies the method of circulants to obtain a very fast approximation to the first. Good results are obtained for a synthetic problem utilizing a digital computer. (13 refs.)

105298 **Rubidium oscillator emerges as time and frequency standard.**
Microwaves & RF (USA), vol.22, no.5, p.155 (May 1983).
A frequency standard developed to provide an extremely stable 10-MHz reference signal for use in navigation, communications, and instrumentation is described. Model AQT-10 makes use of optical pumping, which reuses source atoms instead of depleting them. The ground-state energy level differences of the atoms of rubidium isotope Rb87, which has a resonant frequency of approximately 6.835 GHz, are employed as a frequency discriminator to control the frequency of a voltage-controlled 10-MHz quartz crystal oscillator. An Rb spectral lamp's plasma discharge light is directed through an absorption cell containing Rb vapor to illuminate a photocell detector. A synthesized 6.835-GHz signal derived from the VCO is simultaneously applied to the absorption cell with a resulting drop in light throughput when this signal exactly matches the cell resonant frequency. The consequence is a 10-MHz sine wave with a long-term stability of better than 3×10^{-11} per month, and a short-term stability of better than 2×10^{-12} at a time reference of $\tau=100$ s. (no refs.)

105299 **Multicalibrator—calibrated automatically.** P.Muhlenbroich.
Elektronik (Germany), vol.32, no.15, p.29-32 (29 July 1983). In German.
The Datron 4000/4000 A multicalibrators are described. Both model are based on the use of precision diodes as reference elements and the adoption of pulse width modulation for the reference divider. The 4000 A model can be used over a temperature range of 23±5°C, thereby allowing the calibration of equipment on-site rather than simply in a temperature-controlled calibration laboratory. The Autocal system permits the automatic calibration of the calibrator itself by mathematically compensating for errors such as offset, amplification and nonlinearity introduced by analogue components. (no refs.) *C.C.B.*

105300 **Standardization of radionuclides at the Hungarian National Office of Measures.** A.Szorenyi, J.Vagvòlgyi (Nat. Office of Measures, Budapest, Hungary).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1133-44 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
In the last two decades various radionuclides have been standardised at the National Office of Measures (OMH) and at the present time OMH offers radioactive standard-reference materials for over 50 radionuclides. Suitable direct and relative methods and equipment have been developed for measuring the activity of radionuclides in different forms (e.g. solution, solid sources and standards of large surface area). A short review is given of these systems and of the authors' present research work. OMH cooperative international activity in the field of radionuclide metrology is also outlined. (15 refs.)

105301 Standardization by the efficiency-extrapolation method. L.Grigorescu (Inst. de Fizica si Inginerie Nucleara, Bucuresti, Rumania).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1151-8 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The efficiency-extrapolation method is widely used in coincidence standardization of radionuclides with complex decay schemes. A theoretical analysis is given which indicates that: the (4πsr/2πsr) method for checking the fulfilment of linearity conditions of the gamma-ray channel is sensitive and useful; the systematic error of the extrapolation method is represented by the quantity 'g'; the accurate fulfilment of the linearity conditions is advantageous especially for eliminating the systematic error g. (11 refs.)

105302 Standardization of ^{137}Cs—some remarks on the efficiency function. C.Ballaux (Dept. of Nuclear Metrology, SCK/CEN, Mol, Belgium).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1159-66 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
A solution of ^{127}Cs has been standardized by means of $4\pi\gamma$[NaI(Tl)] integral counting and by 4π(PC)-γ efficiency tracing and extrapolation with ^{134}Cs as tracer. Both methods giving nearly equal results, a γ-ray-emission probability per decay of 0.8516 ± 0.0020 is deduced for the 661.6-keV transition of ^{137m}Ba. The β-ray spectra of both cesium isotopes have been calculated in order to attempt to interpret the efficiency function. (42 refs.)

105303 Survey of standardization possibilities with a NaI(Tl) well-type detector. A.Pavlik, G.Winkler (Univ. Wien, Wien, Austria).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1167-74 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The standardization capabilities of a 12.7-cm×12.7-cm NaI(Tl) well-type detector were investigated for a series of 27 radionuclides of practical interest with different decay scheme complexities. Total detection efficiencies and their uncertainties were calculated for low-mass point-like sources, for 1-cm^3 aqueous solutions, and also for nuclides homogeneously incorporated in a 1-g solid sample of 20-mm diameter. Correlations amongst decay data and partial efficiencies for β- and γ-ray transitions were taken into account. The physical consistency of the chosen decay schemes was tested within their limits of uncertainty by calculating the balance and its uncertainty for the β branches. This enabled tightening of the efficiency-uncertainty limits by taking a choice among different versions of the decay-scheme data. Special attention was paid to the possible calibration accuracy for multigamma-ray sources such as ^{56}Co, ^{75}Se, ^{82}Br, ^{110m}Ag, ^{124}Sb, ^{134}Cs, ^{133}Ba, ^{152}Eu, ^{182}Ta and ^{192}Ir, achieving accuracies in the range $\leq 0.1\%$ to 0.7% by employing special features of a $4\pi\gamma$-detector system. 105304 Diameters and number densities of soot particles in premixed laminar flat flame propane/oxygen. M.E.Weill, P.Flament, G.Gouesbet (Lab. de Thermodynamique, Univ. de Rouen, Mont-Saint-Aignan, France).
Appl. Opt. (USA), vol.22, no.16, p.2407-9 (15 Aug. 1983).
Submicron particle sizing by means of diffusion broadening spectroscopy (DBS) was first extensively used in liquid suspensions, and then the method was extended to the study of particles in moving and (or) hostile environments, thanks mainly to technical improvements in spectrum analyzer and photocorrelator designs. In particular, Penner et al. (1976) pioneered the study of soot growth in flames by means of DBS. Following their work, other similar experiments have been carried out showing that DBS is able to provide reliable results in this field. The authors present soot diameters and number density measurements in a premixed propane/oxygen flat flame. These data are validated by comparison with results obtained by more classical method. (13 refs.)

105305 Apparatus for quick evaluation of surface area.
Instrum. India, p.6-7 (July-Aug. 1982). [received: Aug. 1983]
Describes an instrument which measures the total surface area of finely divided or porous materials. It utilises a unique concept modified from the classical BET low temperature nitrogen adsorption technique. Analysis is accomplished without employing a vacuum system and consequently it is fast and simple to operate. (no refs.)

105306 A water-level sensor using a capacitance to frequency converter. P.J.Ross (Div. of Soils, CSIRO, St. Lucia, Queensland, Australia).
J. Phys. E (GB), vol.16, no.9, p.827-8 (Sept. 1983).
A capacitive water-level sensor using PTFE-insulated wire and a capacitance to frequency converter is described. Construction is simple, yet overall linearity is 0.1%. Temperature drift of the sensor is $-0.05\%\mathrm{K}^{-1}$ and that of the converter is $<0.01\%\mathrm{K}^{-1}$. Long-term stability of the sensor appears excellent. The converter draws only 150 μA from a 5 V supply and is insensitive to supply voltage variations. (1 ref.)

105307 Film thickness monitor based on white light interference. J.R.Sandercock (Labs. RCA Ltd., Zurich, Switzerland).
J. Phys. E (GB), vol.16, no.9, p.866-70 (Sept. 1983).
A simple instrument is described which allows accurate and rapid measurements of thin films having optical thickness in the range 200 nm to 10 μm. A direct readout of either optical or actual thickness is achieved. The instrument operates on the principle that the intensity of white light successively reflected from two thin films reaches an extremum when the optical thickness of the two films are equal. The instrument has found wide spread use within the semiconductor industry. (6 refs.)

105308 X-ray interferometer calibration of microdisplacement transducers. D.G.Chetwynd (Dept. of Engng., Univ. of Warwick, Coventry, England), D.P.Siddons, D.K.Bowen.
J. Phys. E (GB), vol.16, no.9, p.871-4 (Sept. 1983).
A Rank-Taylor-Hobson-Talystep transducer has been coupled to an X-ray interferometer in order to assess the possibility of calibration of very high-resolution transducers down to sub-nm displacements, using an X-ray interferometer, which has ~10 pm resolution traceable to absolute length standards to 1 in 10^6. It is demonstrated that the two instruments can be simultaneously operated at their full precision, and that absolute metrological measurement down to 10 pm should be feasible. The mounting of the available X-ray interferometer introduced parasitic deflections in this application, which were fully evaluated. A design is proposed for a metrological X-ray interferometer that eliminates these errors and also provides a quadrature output for sensing the direction of displacement. (11 refs.)

105309 Use of light diffraction in dimensional gauging. U.Breitmeier (Hommelwerke GmbH, Schwenningen, Germany).
Mess. & Pruef. (Germany), vol.19, no.6, p.329-35 (June 1983). In German.
Recent developments in semiconductors—and in particular in light-sensitive semiconductor device technology have opened new practical possibilities of using light diffraction in the measurements of length, relying on the availability of computers for processing of the signal information. The article introduces the physical principles of the method and its theoretical foundations, describing practical arrangements of the apparatus. The advantages and limitations of the method and its sensitivity are considered in comparison with classical length-gauging method. (7 refs.) *S.R.*

105310 Displacement measurement by coincidence of random-pattern-images using crosscorrelation. T.Idogawa, K.Nagai, H.Akazawa (Inst. of Appl. Phys., Univ. of Tsukuba, Ibaraki, Japan).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.129-38 vol.2
A method of displacement determination by correlation techniques is presented. The method is pertinent to determination of low speed (including zero) to which conventional correlation techniques based on delay determination are not appropriate. Experiments on determinations of displacement and length using experimental devices are described. Main sources of error are investigated. (3 refs.)

105311 Real-time measurements of spatial velocity distribution with a laser Doppler imaging system. T.Yoshimura, H.Sakashita, N.Wakabayashi (Dept. of Instrumentation Engng., Kobe Univ., Kobe, Japan).
Appl. Opt. (USA), vol.22, no.16, p.2448-52 (15 Aug. 1983).
A new laser Doppler imaging system with a TV camera has been constructed, which brightly displays 1-D velocity distribution on a monitor. Some characteristics of this system have been experimentally investigated from measurements of simple velocity distribution on a constantly rotating ground glass disk. From an adaptation to fluid flow, it has been shown that the measurements of spatial velocity distribution can be achieved in real time. (12 refs.)

105312 X-band measurements of the dielectric constant of dust. S.M.Sharief, S.I.Ghobrial (Dept. of Electrical Engng., Univ. of Khartoum, Khartoum, Sudan).
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.143-7
Measurement of the dielectric constant of dust were conducted under different conditions to determine the effect of hygroscopic water, chemical composition, and frequency. Hygroscopic water was found to increase both real and imaginary parts of the dielectric constant. Water contents as low as 4.8% by wt cause the real part to increase by 48% and imaginary part by over 600%. However, moisture affects different samples differently. Chemical analysis showed that the major constituents of dust are SiO_2, Al_2O_3 and Fe_2O_3. Of these SiO_2 was found to be the major contributor to the real part while Al_2O_3 has the greatest effect on the imaginary part. The changes in both the real and imaginary parts of the dielectric constant with frequency were found to be small. (6 refs.)

105313 Measurements of the complex refractive index of soils and airborne particles. S.J.Al-Bader, M.M.Dawoud (Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia).
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.149-52
The results of measurements of the dielectric constant and loss tangent of soils and airborne particles are given for the 8-10 GHz frequency band. The technique utilizes the network analyser by measuring the relative effect on the amplitude and phase of the microwave signal produced by a specimen of soil. Two parent samples are decomposed in accordance with the size of the constituent particles and the complex refractive index of each size interval measured over the frequency band. The results indicate a correlation between the size and density on one hand and the dielectric constant and loss tangent on the other. This correlation is also observed for samples isolated by sieving when compared with airborne samples of similar density and size distribution. (3 refs.)

It is shown that the comparison of Mossbauer spectra can be performed unrestrictedly by means of the statistical correlation method. (9 refs.)

105315 Computer assessment of thermodynamic data. J.B.Pedley, E.M.Marshall (School of Chem. & Molecular Sci., Univ. of Sussex, Brighton, England).
High Temp.-High Pressures (GB), vol.14, no.6, p.641-8 (1982). [received: June 1983] (International Conference on Chemistry of Materials at High Temperatures, Harwell, Oxon., England, 7-10 Sept. 1981).
The thermodynamic data for gaseous oxides (predominantly monoxides) are being collected, assessed, and processed as part of an international collaborative effort in which computer techniques will be used to store, exchange, and assess critically thermodynamic data. Special features involve the establishment of computer files containing data both for Gibbs energy and for thermal functions, which can be continuously updated, and the development of programs to identify inconsistent data, enabling critical assessment to be carried out more effectively. Other programs are used to present the assessed data and to process it to give standard thermodynamic functions. (5 refs.)

06.60 LABORATORY TECHNIQUES

105316 Microfabrication as a scientific tool. R.E.Howard, P.F.Liao, W.J.Stocpol, L.D.Jackel, H.G.Craighead (Bell Labs., Holmdel, NJ, USA).
Science (USA), vol.221, no.4606, p.117-21 (8 July 1983).
Research in microfabrication not only serves the microelectronics industry but also can provide research tools for studying the behavior of matter at submicrometer dimensions. A variety of techniques including optical, X-ray, and electron beam lithography and reactive ion etching can be used to make structures, devices, and arrays only hundreds of atoms across. Microfabrication techniques have been applied to experiments on surface-enhanced Raman scattering, transport in one-dimensional conductors, and macroscopic quantum tunneling. Recent progress is extending these techniques to scales of less than 100 angstroms. (39 refs.)

06.70 GENERAL INSTRUMENTATION

105317 Enhancement of gas sensitivity by controlling microstructure of α-Fe_2O_3 ceramics. Y.Nakatani, M.Sakai, M.Matsuoka (Wireless Res. Lab., Matsushita Electric Industrial Co. Ltd., Osaka, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.912-16 (June 1983).
The authors have found that the gas sensitivity of α-Fe_2O_3 ceramics can be greatly enhanced by controlling its microstructure by adding quadrivalent Ti, Zr or Sn. These metals have the effect on suppressing the grain growth and crystallization, and consequently increasing the specific surface area of the sensing element. With Sn in particular, the sensing element consists of ultrafine grains as small as about 100 Å and has an extremely large specific surface area of 125 m^2/g. However, the additives are effective only in the presence of the sulfate ion, which is considered to localize mainly on the surface of the α-Fe_2O_3 grains. Thus the surface of the grains, which is fairly amorphous, is thought to play an essential role in the gas sensitive mechanism. (7 refs.)

105318 Pulsed strain-gauge system. L.S.Poleshchuk (Inst. of Geology & Geophys., Acad. of Sci., Novosibirsk, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1487-9 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.156-8 (Nov.-Dec. 1982).
A pulsed strain-gauge system is described that uses series 176 and 544 integrated circuits. The bridge is supplied with stabilized current pulses with exponential leading edges and steep trailing ones. The range in strain measurement is 10^{-2}-10^{-6}. The error of measurement in the frequency range 0-100 Hz is not more than 1-2%. (5 refs.)

Appl. Phys. Lett. (USA), vol.43, no.5, p.446-8 (1 Sept. 1983).
It is demonstrated theoretically and confirmed experimentally that the intrinsic spatial resolution of a thermal wave microscope in the extreme near field limit is independent of thermal wavelength and is determined by the depth of the thermal scatterer beneath the surface of the specimen. (15 refs.)

105320 Measurement of heat transfer in closed hot water systems [errors evaluation]. C.Meisser (Landis & Gyr AG, Zug, Switzerland), K.Ellinghaus.
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.289-98 vol.2
The error characteristics of a heat meter utilizing platinum resistance thermometers depend on four factors. Models are described for errors associated with the k-value, the temperature difference and multiplication. For the determination of errors due to the measurement of volume flow, an analytical formula is presented, based on extensive measurements of the WSA & WSB ultrasonic heat meters. The total measurement error of such a meter can thus be simply predicted. (5 refs.)

07.20D Thermometry

105321 A temperature measuring instrument with digitally adjustable comparator. J.Thomann.
Elektron. Appl. (Germany), vol.15, no.7, p.36-7 (July 1983). In German.
Designed for the Intersil Datel temperature sensor AD 590 a circuit is described for temperature measurement and indication in the range −55°C to +128°C. Temperature to voltage conversion uses an operational amplifier to give output of 10 mV/°C, and a further operational amplifier and CMOS convertor IC ADC-EK-8B provide digital conversion of the temperature voltage analogue. The 8-bit temperature representation operates into a comparator comprising integrsted circuits and encoding switches, to give indications of temperature outside and between uper and lower limit values digitally adjustable with the encoding switches. The a/d convertor and comparator are applicable with devices other than temperature sensors. Some instrument constructional hints are given. (no refs.) *H.V.H.*

105322 Room-hydrogen temperature and room-nitrogen temperature semiconductor resistance thermometers for measuring hydrogen and nitrogen temperatures. A.B.Aleinikov, L.I.Zarubin, I.Yu.Nemish.
Optoelektron. & Poluprovodn. Tekh. (USSR), no.1, p.93-5 (1982). In Russian.
The feasibility of using room-hydrogen (RH) and room-nitrogen (RN) thermometers for the temperature of the hydrogen and nitrogen regions in magnetic fields up to 6 T is studied, the errors introduced by the magnetic field are assessed, and a simple method of introducing corrections which significantly decrease the error is proposed. The curves show that the error introduced by the magnetic field is directly proportional to temperature, which can be explained by the increase in the slope of the thermometric characteristic at the end of the thermometer's working range. It is shown that in using RN thermometers with parallel orientation relative to the magnetic field it is generally possible to obtain at least 1% accuracy for nitrogen temperatures in fields up to 6 T. In the case of hydrogen temperatures, for any orientation of the thermometer the error in the same fields can rise as high as 3%, but the introduction of certain corrections decreases the error to 0.5%. (4 refs.) *N.F.S.*

105323 A method to determine and reduce the response time of resistance thermometers under practical conditions. H.R.Taylor (Dept. of Electrical Engng. & Electronics, Univ. of Manchester Inst. of Sci. & Technol., Manchester, England), H.A.Navarro.
J. Phys. E (GB), vol.16, no.9, p.916-18 (Sept. 1983).
An analogue model of a resistance thermometer immersed in a fluid is proposed. It is shown how measurements of the self-heating effect can be used to determine the parameters of the model, and hence the time response of the thermometer under working conditions. These parameters reveal important information about the thermometer and its environment and make it possible to design a compensating filter. A significant improvement has been achieved by this method. (1 ref.)

105324 Thermometry by CARS in an automobile engine. G.C.Alessandretti, P.Violino (Fiat Res. Centre, Orbassano, Italy).
J. Phys. D (GB), vol.16, no.9, p.1583-94 (14 Sept. 1983).
Temperature measurements in an automobile engine running in normal operating conditions have been obtained by observing the CARS spectra of molecular nitrogen. Pulsed lasers and a broad-band technique have been used to allow the single-pulse measurements necessary for studying combustion behaviour and cycle-to-cycle fluctuations. A fitting technique has been used to determine temperatures from the experimental data, with an uncertainty of about 50 to 100K. The authors discuss the problems that are still unresolved in order to achieve better accuracy: beside experimental refinements a further knowledge of molecular parameters seems to be required. (35 refs.)

105325 High resolution quartz temperature sensors. U.Priess.
Qualite Rev. Prat. Controle Ind. (France), vol.22, no.120, p.76-8 (April 1983). In French.
By suitable cutting of a quartz crystal it is possible to obtain a linear relationship between temperature and frequency. Suitable angles of cut are given for frequencies between 1.65 and 13.56 MHz. Suggested applications are (a) flowmeters, where the rate of flow produces a fall in temperature of a heated quartz crystal, and the resulting change in frequency is a measure of the rate of flow; (b) measurement of low gas pressures from the heat of loss of the crystal. (7 refs.) *N.C.*

105328 Determination of high melting points of metals and slags by a contact method. N.P.Lyakishev, A.G.Semin (I.P. Bardin Central Sci.-Res. Inst. of Ferrous Metall., Moscow, USSR).
Ind. Lab. (USA), vol.48, no.11, p.1103-6 (Nov. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.11, p.44-6 (Nov. 1982).
A device for determining the melting point of metals and slags of up to 2273K and which is based on the thermo-optical method is described. The device includes a microfurnace with a molybdenum or tantalum heating element, an electric power unit with automatic and manual regulation, a binocular magnifier (×2-10), and a VR 5/20 tungsten-rhenium thermocouple with a PP-63 potentiometer. The mains voltage is 127/220 V. The maximum load current 24/40 A, frequency 50 Hz, regulated voltage 0-250 V. A reducing gear with a 150 W electric motor (20 rpm) is connected to the device for automatic regulation. The distinguishing feature of the device is the design of the heating element and positioning of the specimen above the hot junction of the thermocouple. (8 refs.)

07.20M Cryogenics

105329 Microminiature refrigerators for cooling detectors. R.Wolfe, R.M.Duboc,Jr. (MMR Technol., Mountain View, CA, USA).
Photonics Spectra (USA), vol.17, no.7, p.52-5 (July 1983).
Miniature Joule Thomson refrigerators provide a new detector cooling alternative for both commercial and military applications. Although these microminiature refrigerators use the same thermodynamic principles of operation as the traditional J-T cryostats, the similarities stop there. In many applications, they offer significant advantages in size, weight, and often in cost and performance. The solution to the scaling problem is to use photolithographic techniques, similar to those used in semiconductor manufacturing, to define very precise, small channels in low thermally conductive substrates (typically glass). Etched in this way, they form a network of encapsulated channels, which by design form a Joule-Thomson refrigerator. In mass production, a step-and-repeat process is used to produce a mask of many duplicate images of channel pattern. With this mask one can produce multiple copies of the refrigerator on one large substrate, which is later diced to produce the individual units. This fabrication process has proved to be reliable and consistent, leading to low unit costs in high-unit-volume applications. (3 refs.)

105330 Alternate approaches to cryogenic cooling [spaceborne IR detectors]. W.Atkinson, A.DeVilliers, R.Kappesser (Riverside Res. Inst., Arlington, VA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.130-8 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
Cryogenic cooling techniques for spaceborne infrared detectors are surveyed. An alternative class of cooling cycles is defined, and four practical cycles described. A general overview of operating efficiency for the whole class is developed. One of these cycles, the isobaric absorption cycle (Servel cycle), is explored in some detail. (8 refs.)

105331 Four-point magnetoresistivity measurements. R.H.Norton (Magnetic Bubble Memory Dept. Nat. Semiconductor Corp., Santa Clara, CA, USA).
IEEE Trans. Magn. (USA), vol.MAG-19, no.4, p.1579-80 (July 1983).
The standard four-point resistivity probe for unpatterned thin films is not suitable for saturation magnetoresistivity measurements. Modifying the geometry of the four points, however, gives a simple and reliable measurement. (no refs.)

105332 Apparatus for the investigation of deep level parameters in semiconductors. V.B.Barkov, L.V.Lebedeva, I.A.Fomin.
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1513-17 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.178-81 (Nov.-Dec. 1982).
An apparatus is decreased for which the method of recording the relaxation of the capacitance of a p-n junction or a Schottky barrier, proposed by Lang (1974) underlies the operation. Utilization of a two-channel stroboscopic integrator in the apparatus permitted complete automation of the process of recording the temperature spectrum of a signal, and execution of the recording of the deep-level concentration profile in the semiautomatic regime. The apparatus permits investigation of diverse traps in semiconductors with the activation energies 0.15-0.9 eV by measuring rapid (5 μsec-1 sec) relaxations of the specimen capacitance during temperature scanning in the 100-423 K band. The apparatus contains a circuit for automatic calibration. (8 refs.)

105333 Spark-discharge energy meter. S.K.Gil', E.N.Dolgov (Leningrad Technol. Inst., Leningrad, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1520-2 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.184-5 (Nov.-Dec 1982).
An instrument for remote measurement of the energy of spark discharges which occur when static electricity builds up in dielectric media is described. The operation of the instrument is based on registration of the electromagnetic radiation of the spark. The repetition rate of spark discharges is up to 100 Hz at a minimum pulse duration of 5 μsec. The sensitivity of the instrument is 10^{-8} J/mA. (5 refs.)

105334 A method of digital loss angle measurement. A.Krzywaznia, P.Madej, J.Ociepka (Inst. of Electrical Metrology, Tech. Univ. of Wroclaw, Wroclaw, Poland).
J. Phys. E (GB), vol.16, no.9, p.823-5 (Sept. 1983).
Describes the principle and the main measurement errors of a loss angle meter based on digital pulse time width measurement. The concept of measuring the loss angle by using a time measurement technique has many advantages. Particularly, it eliminates material capacity standards and requires a frequency standard only. The main limitations on the accuracy are due to analogue signal processing. The achieved accuracy of the instrument is comparable with that of automatic transformer bridges, but the resolution of measurement is much better, and the measuring voltage is smaller than that of automatic bridges operating in the same frequency region. (1 ref.)

105335 An instrument to measure Hall voltages in low-mobility, high-resistivity irregularly shaped samples. D.Marioli, V.Varoli (Centro Studi Nucleari Enrico Fermi (CESNEF),,Milano. Politecnico di Milano,Italy).
J. Phys. E (GB), vol.16, no.9, p.892-5 (Sept. 1983).
The instrument described employs a zeroing technique to measure the Hall voltage in low-mobility, high-resistivity and irregularly shaped samples of semiconductor materials. The measurement is performed following the Van der Pauw method. The zeroing technique permits the reduction of the large errors introduced by the conventional methods when the Hall voltage is only a small fraction of the unbalance voltage existing between the measuring points of the asymmetrical sample in the absence of magnetic field. Using this instrument Hall voltages as low as a few microvolts are detectable even in samples which have hundreds of millivolts of offset voltage, and mobility values lower than 10^{-4} m^2 V^{-1} s^{-1} have been successfully measured. (5 refs.)

105336 An automatic digital electrometer. D.Dosen.
Rev. Telegr. Electron. (Argentina), vol.71, no.838, p.170-2 (March 1983). In Spanish.
Describes an electrometer designed for the automatic measurement of very low ion currents (10^{-13} A) when determining very high vacuum pressures (10^{-10} Torr) with a conventional Boyard Alpert type ionisation manometer. As a result of the decision to use the simplest possible design permitting the use of components available within Argentina and permitting digital operation for the ultimate use of computer control, it was decided that the technique known as charge sampling should be adopted. After giving the reasons for this choice, the author explains the charge sampling technique, gives an analysis of the inherent errors and finally describes the operating principles of the amplifiers used to amplify the signal from the charge sampler. (9 refs.) *G.W.*

105337 Optimization of design parameters of eddy-current feedthrough transducer. V.K.Zhukov, V.F.Bulgakov (Sci.-Res. Inst. of Electronic Introscopy, Tomsk, USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.10, p.787-95 (Oct. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.10, p.39-49 (Oct. 1982). [received: Sept. 1983]
A mathematical model is proposed for describing a short defect. The design of a triple-winding eddy-current feedthrough transducer is optimized taking into account the effect of interference factors attributable to axial nonuniformity of electromagnetic properties and to radial displacements, and also the effect of 50 Hz industrial-frequency pickup. (6 refs.)

105338 Measurement of transmission bandwidth for optical fibres. W.A.Steffen, W.Kotyczka.
Tech. Mitt. PTT (Switzerland), vol.61, no.8, p.249-58 (1983).
The authors deal with the complex area of measurement of transmission bandwidth for optical fibres. At first, the article outlines the specific problems of optical fibres and the requirements of the practical measurement techniques. It then proceeds to the hardware and software construction of a set-up for optical sweep measurements of high dynamic range qualified for fieldwork. The measurements performed with this set-up on the optical fibre installation of Altdorf-Erstfeld are commented in a special section. (4 refs.)

105339 Experimental facility to measure conductivity of liquid metals and semiconductors.. H.-U.Tschirner (Sektion Phys., Tech. Hochschule Karl-Marx-Stadt, Karl-Marx-Stadt, Germany).
Wiss. Z. Tech. Hochsch. Karl-Marx-Stadt (Germany), vol.25, no.2, p.204-18 (1983). In German.
A survey of conventional and new methods is given. The well known 'Two to four point method', the electrodeless method and others are reviewed. All contactless methods rely on the induction of eddy currents in the probe as a result of changes in the magnetic field. These eddy currents are directly proportional to the conductivity of the material in question. Another method is the rotating field, i.e. three phase field, in which the relationship of torque and the conductivity has been expressed in the form of an equation. Curves show electrical conductivity of liquid In-Te alloys as a function of concentration and the dependence of electrical conductivity of the alloys on temperature. A sketch of the measuring arrangement and a drawing of measuring cells by Davies and Leach (1969), Nakamura and Shimoji (1969) are given. (62 refs.) *G.R.S.*

105340 Electromagnetic stirred mode cavities (SMCs). R.N.Clarke.
Report NPL-DES-75, Nat. Phys. Lab., Teddington, England (Aug. 1982), 41 pp.
This survey seeks to draw together from a wide range of areas in electromagnetic metrology those aspects of the theory and use of the stirred mode cavity which should be of relevance in all of its applications. Short descriptions of four types of application are included in which relevant aspects of stirred mode cavity performance are highlighted, chiefly with a view to explaining their relevance to microwave or millimetre wave metrology. The areas covered are power measurements, dosimetry, electromagnetic compatibility studies and dielectric measurements. Aspects of the latter are discussed in some depth. (49 refs.)

07.55 MAGNETIC INSTRUMENTS AND TECHNIQUES

105341 Determination of the magnetic permeability of a complex-shape body using magnetic field measurements. II. I.P.Stadnik, V.V.Milyukov, G.P.Kozik.
Izv. VUZ Elektromekh. (USSR), no.7, p.14-17 (July 1983). In Russian.
In the first part of this contribution (see ibid., no.6, p.17-22, 1983), two methods for the determination of the magnetic permeability of bodies of complex shape were proposed and analysed. In this part, this problem is considered in greater detail. Thus, for the first method, an expression is derived and a graph constructed, for the magnetic permeability of bodies, using measurements of the resultant field component at a point. In the second method, based on a solution of the reverse case of magnetostatics, the permeability is found by measuring the resultant scalar magnetic potential on the outer surface of the magnetic body. The application of the two methods is illustrated by examples. (2 refs.) *Z.F.V.*

105342 General-purpose superposed transducer for inspecting the magnetic permeability of products made from weakly magnetic materials. A.A.Avramenko, V.A.Drunov, V.P.Sebko, V.I.Tyupa (V.I. Lenin Kharkov Polytech. Inst., Kharkov, Ukrainian SSR).
Ind. Lab. (USA), vol.48, no.11, p.1113-16 (Nov. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.11, p.51-2 (Nov. 1982).
A general-purpose superposed transducer is discussed that can measure the characteristics of weakly magnetic products having plane and cylindrical surfaces. The device uses the transducer in a differential circuit based on a pulsed-induction method of measurement with DC. The magnetizing windings of operating and compensating transducers are connected in series aiding, but the measuring windings are connected in series opposing. The difference between the flux linkages of the measuring windings is measured with a flux meter during switching of the current. The magnetizing current is indicated on an ammeter. By means of a magnetic shunt on the compensating transducer the circuit is balanced. (6 refs.)

07.58 MAGNETIC RESONANCE SPECTROMETERS, AUXILIARY INSTRUMENTS AND TECHNIQUES

(see also 61.16N EPR and NMR determinations)

105343 Portable NMR sample localization method using inhomogeneous RF irradiation coils. M.R.Bendall (School of Sci., Griffith Univ., Nathan, Queensland, Australia).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.310-15 (12 Aug. 1983).
In NMR spectroscopy, a phase-cycled multipulse scheme has been shown to discriminate against sample regions where pulse angles differ markedly from ideal $\pi/2$ and π angles. Potentially, the method may be used with multiple inhomogeneous RF coils to obtain a spectrum from a localized region of a large sample, and this is illustrated by a first attempt with a double surface coil. (10 refs.)

105344 Superconducting solenoid for an ESR spectrometer. V.I.Kurochkin, A.Ya.Laptienko, N.V.Taryanik, V.V.Sukhoi, V.V.Shaparenko (Special Designs Office, Donets Tech. Phys. Inst., Donet, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1485-7 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.154-5 (Nov.-Dec. 1982).
A superconducting solenoid is described for a 2 mm ESR spectrometer, which has internal and external slots and which produces a magnetic field of 7.5 T with a homogeneity of about 10^{-5} per cm. The field modulation of 0.05 T at 10 Hz and sweep of ±0.1 T are provided by a superconducting winding within the solenoid. (3 refs.)

105345 Experimental verification of depth pulses applied with surface coils. M.R.Bendall (School of Sci., Griffith Univ., Nathan, Queensland, Australia), W.P.Aue.
J. Magn. Resonance (USA), vol.54, no.1, p.149-52 (Aug. 1983).
Recently it was shown that phase cycling of pulses in multipulse sequences in the manner of Bodenhausen et al. (ibid., vol.27, p.511, 1977) and Demco et al. (ibid., vol.16, p.467, 1974) enables use of these sequences with surface coils to partially localize the sample region. These multipulse sequences, which were called 'depth pulses' when used for sample localization, were introduced by a theoretical discussion and were established experimentally using a normal high-resolution spectrometer. These experiments involved using a normal irradiation coil (saddle) of high RF homogeneity, and varying the pulse lengths to mimic the behavior of sample regions at varying distances from a surface coil. The recent availability of a 300 mm bore 80 MHz (proton) Oxford magnet equipped with a Brukerk CXP console, to provide high-power programmable RF pulses, has enabled direct experimental verification of these depth pulses when used with surface coils. (5 refs.)

105346 Overcoupling NMR probes to improve transient response. G.C.Chingas (Chem. Div., Naval Res. Lab., Washington, DC, USA).
J. Magn. Resonance (USA), vol.54, no.1, p.153-7 (Aug. 1983).
When excessively long probe ringing after a radio frequency (RF) pulse interferes with receiver operation, the probe coil must be damped to reduce the lifetime of the transient. Although a popular approach involves using auxiliary resistance to lower the effective coil Q, it is also possible to achieve the same end by coupling a high Q coil to the transmission line more strongly than the matched condition prescribes. Overcoupling a coil by tuning it to mismatch offers several benefits. From a practical viewpoint, the tradeoff between performance and ringdown can be selected simply by 'tweaking' the probe tuning capacitors. (6 refs.)

105347 A simple high-pressure sample cell for diffusion coefficient measurements by the spin-echo technique. A.J.Easteal, L.A.Woolf, F.L.Wilson (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
J. Magn. Resonance (USA), vol.54, no.1, p.158-60 (Aug. 1983).
A sample cell similar to that described by Jonas (Rev. Sci. Instrum., vol.43, p.643, 1972) has been used successfully in the authors' laboratory for several years for diffusion coefficient measurements on liquids over extended pressure and temperature ranges. The cell is esentially a glass sample tube joined with a glass/metal seal to a 0.1 mm wall thickness stainless steel bellows which transmits pressure to the sample. The cell has the limitations that (a) it cannot be used for samples which corrode glass or stainless steel and (b) the glass breaks and/or the bellows is severely distorted if the sample should freeze during measurements. The authors describe a sample cell that does not have these limitations. The cell is constructed in such a way that the sample is in contact only with PTFE. Pressure is transmitted via a collapsible thin-wall (0.25 mm) PTFE 'bellows'. (4 refs.)

105348 The influence of the waveform of the time-dependent magnetic field gradient on the spatial localization in the sensitive-point method of NMR imaging. S.Ljunggren (Dept. of Phys. Chem., Royal Inst. of Technol., Stockholm, Sweden).
J. Magn. Resonance (USA), vol.54, no.1, p.165-9 (Aug. 1983).
In the sensitive-point method of NMR imaging sinusoidally modulated linear-magnetic field gradients are applied in three mutually perpendicular directions. The resulting time averaged in-phase component of the signal will then originate from just a small proportion of the sample in the vicinity of the 'pivoting point' where the field remains constant. It is of interest to see whether a better localization can be obtained by using a different waveform to modulate the gradient. The author calculates the signal corresponding to an arbitrary periodically varying gradient in the x direction: $G_x(t)=G_x{}^0f(t)$ with the period $2\pi/\omega_m$. The resonance frequency at the point x of the sample will then be $\omega_A=\gamma B_z(x)=\omega_0+\omega_s f(t)$, where the author has introduced $\omega_s=\gamma G_x{}^0x$ and $\omega_0=\gamma B_0$. (4 refs.)

105349 Apodization and exact 'integration' of Fourier transform nuclear magnetic resonance spectra. S.O.Chuan, M.B.Comisarow (Chem. Dept., Univ. of British Columbia, Vancouver, British Columbia, Canada).
J. Magn. Resonance (USA), vol.54, no.2, p.201-15 (Sept. 1983).
Calculation by magnitude Lorentzian interpolation of the scaling factor for the components of the FTNMR FID has been previously shown to give a more accurate measure of the number of chemically equivalent nuclei than does the traditional procedure of digital integration. Judicious choice of a line broadening factor for the FID increases the measurement accuracy of the scaling factor determination. The reasons for the increased accuracy can be discussed in terms of changes in the discrete spectral signal to noise (S/N) ratios upon line broadening. For small values of $T/T_2{}^*$, the ratio of the acquisition time to the relaxation time of the NMR FID, line broadening may increase or decrease the signal to noise ratio of the three discrete spectral intensities used in the magnitude Lorentzian calculation. But for larger values of $T/T_2{}^*$, line broadening within a factor of 3-4 of the matched filter always increases the S/N ratio. While excessive line broadening (slightly) decreases the accuracy of the scaling factor calculations for well separated lines, it can be employed to accurately determine the total number of nuclei which give rise to overlapping lines. (9 refs.)

105350 Investigation of coupled spin networks by two-dimensional multiple-quantum coherence spectroscopy. M.A.Thomas, A.Kumar (Dept. of Phys., Indian Inst. of Sci., Bangalore, India).
J. Magn. Resonance (USA), vol.54, no.2, p.319-23 (Sept. 1983).
Recently Ernst, Bolton, and co-workers (1982) have demonstrated that the identification of groups of resonances belonging to the same network of scalar coupled spins can be achieved using a modified version of two-dimensional correlated spectroscopy and the complete coupling network identified, through relayed coherence transfer. When a nucleus A spin coupled to another nucleus M, which in turn is coupled to a third nucleus X, with the A-X coupling being vanishingly small, the cross peak between A and X is absent in the normal homonuclear two-dimensional (2D) correlated spectroscopy, yielding no conclusive evidence that these spins beong to a coupled network. Through their modified pulse scheme ($90°$-t_1-$90°$-τ-$180°$-τ-$90°$-t_2), Ernst and co-workers have shown that it is possible to correlate the nuclei A and X, where the efficiency of coherence transfer is proportional to $\sin(2\pi J_{AM}\tau)$ $\sin(2\pi J_{MX}\tau)$. A study of various multiple-quantum coherences is a more general method and leads to the identification of such coupled spins in a network. In particular, in cases where there are, accidental or otherwise, overlaps of resonances within a coupling network, a study of the multiple-quantum transitions (MQT) unambiguously yields the desired information. (6 refs.)

105351 Quadrature detection coils—a further $\sqrt{2}$ improvement in sensitivity. C.-N.Chen, D.I.Hoult, V.J.Sank (Div. of Res. Services, Nat. Inst. of Health, Bethesda, MD, USA).
J. Magn. Resonance (USA), vol.54, no.2, p.324-7 (Sept. 1983).
Several years ago, one of the authors published an article which described the use of orthogonal receiving coils for determining the sign of the gyromagnetic ratio (Hoult, 1978). The idea was by no means original, having first been communicated to the author by H.D.W. Hill in about 1968. However, the present authors have been prompted recently to examine afresh the use of 'crossed-coil' systems in the belief that they are of considerably greater value than has previously been realized. (3 refs.)

105352 Multiple-quantum relayed transfer spectroscopy. P.H.Bolton (Chem. Dept., Wesleyan Univ., Middletown, CT, USA).
J. Magn. Resonance (USA), vol.54, no.2, p.333-7 (Sept. 1983). (14 refs.)

105353 A simple graphical representation of Fourier-based imaging methods. S.Ljunggren (Dept. of Phys. Chem., Royal Inst. of Technol., Stockholm, Sweden).
J. Magn. Resonance (USA), vol.54, no.2, p.338-43 (Sept. 1983).
In the case of periodically modulated field gradients a Fourier series expansion in the time domain of the function $\exp(i\mathbf{k}(t).\mathbf{r})$ may be the best way of effecting the image reconstruction. However, the picture of the trajectory in the $\mathbf{k}$ plane may provide a more direct and visual basis for the comparison of different methods and for the construction of new variants. Some of the current NMR imaging methods are examined from this unified viewpoint. For the sake of convenience the author limits himself to two-dimensional cases. (8 refs.)

105355 A hinged prism device for alignment in hilly terrain. F.A.Ahmed (Dept. of Civil Engng., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia).
Arabian J. Sci. & Eng. (GB), vol.8, no.2, p.123-8 (April 1983).
Discusses the development of a hand-held device which facilitates alignment in hilly terrain. The device is used to establish points between two existing but not intervisible points. Furthermore, if existing targets are intervisible, but a large vertical angle is involved in setting any of the points, the new optical aligner may be used. It consists basically of two right-angled pentagonal prisms that can turn on a vertical plane to face the nonintervisible points. Hence the two points can be observed simultaneously despite the differences in height. Experiments with the prototype developed show that a standard deviation of ±1 cm per 100 m is obtainable in setting a point. The procedure takes less than one minute. Thus, the instrument is both simple and efficient. (3 refs.)

07.60D Photometry and radiometry

(inc. colorimetry; see also 07.62 Detection of radiation)

105356 Remote sensing applications of pulsed photothermal radiometry. A.C.Tam, B.Sullivan (IBM Res. Lab., San Jose, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.333-5 (15 Aug. 1983).
The technique of pulsed photothermal radiometry (PPTR) (i.e. detection of the transient infrared thermal radiation from a condensed matter sample heated by a short-pulsed radiation) is useful for single-ended remote sensing applications. The authors demonstrate for the first time such applications for spectroscopic detection, measurement of absolute absorption coefficients in opaque materials, and sensing of dimensions or thermal properties in inhomogeneous materials. Theory of the PPTR technique in the simple case of a semi-infinite homogeneous material is described. (10 refs.)

105357 A portable densitometer with digital indication. M.E.Shul'man, I.F.Shchedrin, V.A.Kazintsev (Design and Technol. Inst. Energomontazhproekt, Moscow, USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.10, p.775-7 (Oct. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.10, p.28-9 (Oct. 1982). [received: Sept. 1983]
To increase the resolving power and accuracy of measurements of the density of blackening of radiographs, a portable densitometer with the digital indication of measurement results was developed. The method of determining the density of blackening of the radiographs, employed in this device, is based on the conversion of the light flux passed through the photograph into a current or voltage, with the subsequent conversion of electrical signals into a digital code equivalent to the density of blackening. (2 refs.)

105358 Evaluation of an effective medium temperature from radiometric-satellite beacons comparisons. P.Sobieski, M.Van Schingen, A.Laloux (Lab. de Telecommunications, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium), G.Brussaard.
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.225-31
Radiometric calibration by OTS beacons is analyzed for the propagation data base produced by the European Space Agency SCTS station and four fluxmeters, for the three first years of the satellite. An effective medium temperature model is proposed in order to improve the prediction method of attenuation from radiometric statistics. An analysis of the predictor is also performed in terms of static error and standard deviation for the proposed model. (11 refs.)

105359 Influence of surface type on the brightness temperature of snow-covered terrain. M.T.Hallikainen (Radio Lab., Helsinki Univ. of Technol., Espoo, Finland), M.C.Dobson, S.Moezzi.
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.273-9
The effect of various surface types on the satellite-derived brightness temperature of snow-covered terrain at 18 GHz and 37 Ghz is investigated using digitized surface type maps of Finland. From the Nimbus-7 SMMR data for numerous test areas with mixed surface types, the response of each major surface type is derived. The results are compared with theoretical values using plane boundary and rough boundary brightness temperature models. (11 refs.)

105360 Comparison of two methods for estimating the water vapor correction to altimeter readings from radiometric measurements. A.Guissard (Lab. de Telecommunications, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.347-54
Two methods are described for extracting the wet path length correction to altimeter's range measurements from a two-frequency radiometer. Both instruments are on-board of the same spacecraft and the wind speed is assumed known to within ±2 m/s from the altimeter readings. One method is a modification of Grody's method for the determination of water vapor and liquid from space. The other method is an extension of a method proposed by Wu for ground-based determination of the wet path length. A careful comparison of their respective performances is made by proceeding to a simulation analysis on 1080 cases. It is concluded that the extended Grody's method works the best giving, for the analysed set, a maximum standard deviation of 1.8 cm for the wet path length. (47 refs.)

07.60F Polarimetry and ellipsometry

105361 High-speed retardation modulation ellipsometer. A.Moritani, Y.Okuda, H.Kubo, J.Nakai (Dept. of Electronic Engng., Osaka Univ., Osaka, Japan).
Appl. Opt. (USA), vol.22, no.16, p.2429-36 (15 Aug. 1983).
Construction and performance of a high-speed retardation modulation ellipsometer are described. An ADP four-crystal electrooptic modulator is used for the retardation modulation and a high-speed digitizer for the simultaneous detection of the transmitted light intensity and the modulation voltage. The ellipsometer can acquire the necessary data for determining a data point (Ψ,Δ) in 4 μsec and repeat the data acquisition for fifty data points at intervals of 4 μsec-160 msec. In such conditions, precision represented in terms of an average of root mean squares is 0.05° in Ψ and 0.15° in Δ when a BaK1 standard optical glass is used as a sample at the present stage. An example is given of the application to rapid growth of anodic films on a semiconductor GaAs wafer. (38 refs.)

105362 Highly sensitive instrument for measuring optical birefringence. Y.Shindo, H.Hanabusa (Res. Inst. for Material Sci. & Engng., Faculty of Engng., Fukui Univ., Fukui, Japan).
Polym. Commun. (GB), vol.24, no.8, p.240-4 (Aug. 1983).
A highly sensitive instrument for the measurement of optical birefringence, utilising a photoelastic modulator and a phase-sensitive technique, is described and discussed. The instrument has not only the high sensitivity required to measure very small retardation but also the capability of measuring large retardation accurately. The instrument is especially suitable for detecting very small changes in birefringence. The method of calibration of the instrument is explained. The results obtained for poly(methyl methacrylate) samples are presented and compared with those obtained using a polarising microscope equipped with a Berk-compensator. (9 refs.)

105363 A method of multibeam ellipsometry. Yu.A.Kontsevoi, M.S.Finarev.
Ind. Lab. (USA), vol.48, no.11, p.1107-9 (Nov. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.11, p.47-8 (Nov. 1982).
Examines the simplest variant of the multibeam ellipsometry in which the working light beam passes in the gap between the specimen and the mirror. The ellipsometric parameters of the specimen-mirror system are determined. (2 refs.)

Spectropolarimeter with electromechanical compensation ...... See Entry 105381

07.60H Refractometry and reflectometry

105364 Scattering and absorption of turbid materials determined from reflection measurements. II. Measuring method and calibration. R.A.J.Groenhuis (Lab. for Materia Tech., State Univ. Groningen, Groningen, Netherlands), J.J.Ten Bosch, H.A.Ferwerda.
Appl. Opt. (USA), vol.22, no.16, p.2463-7 (15 Aug. 1983).
For pt.I see ibid., vol.22, no.16, p.2456 (1983). A new experimental method has been developed to determine the scattering and absorption characteristics of a turbid material. Existing methods usually require transmission and reflection measurements carried out on a thin slab of the material under study; this method is based on reflection measurements carried out on bulk material. This will be of great advantage in many applications. This paper describes the measuring system and indicates the area of application of the method. Calibration measurements have been carried out to substantiate the approach. (8 refs.)

105365 Accurate method of measuring the temperature independence of the reflectance of metal mirror surfaces. V.P.Andronov, V.L.Okulov, V.P.Savelev'eva.
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1470-3 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.140-2 (Nov.-Dec. 1982).
Equipment for measuring the temperature dependence of the reflectance of metal mirror surfaces is described. The multiple reflection method is used to increase the measurement accuracy. The main component of the equipment is a two-mirror multipath cuvette. One of the mirrors of the cuvette is a standard mirror, and the second can be heated to a temperature of 500°C in air or in an atmosphere of the light inert gases (He, Ne). The measurements were made simultaneously at wavelength of 0.63 μm and 10.6 μm. The error in measuring the reflectance is ±0.002 at a wavelength of 0.63 μm, and ±0.004 at a wavelength of 10.6 μm. (4 refs.)

105366 An instrument for measuring the curvature of reflecting surfaces. A.F.Foederer, J.L.M.Hagen, A.G.van Nie (Philips Res. Labs., Eindhoven, Netherlands).
Philips Tech. Rev. (Netherlands), vol.40, no.11-12, p.338-41 (1982).
An instrument is described that can be used for measuring the shape of a surface. The measurement is fully automated, and no force is exerted on the surface. The inaccuracy of the measurement is less than ±2.5% for a radius of curvature of 3 m and a test length of 50 mm. The optical system is focused on the reflecting surface by a method used in the LaserVision system. The light source is the AlGaAs semiconductor laser used in the Compact Disc system. The linear movement along the surface is guided by aerostatic air bearings with a tapered gap. These bearings are less difficult to produce than air bearings with a parallel gap, and are less sensitive to dirt and damage. (8 refs.)

07.60L Interferometry

105367 Cyclic interferometers for optical testing. A.Cordero-Davila (Univ. Autonoma de Puebla, Puebla, Mexico), J.Pedraza-Contreras, O.Cardona-Nunez, A.Cornejo-Rodriguez.
Appl. Opt. (USA), vol.22, no.16, p.2478-80 (15 Aug. 1983).
In this paper, the authors describe two compact cyclic interferometers which can be used for the testing of right-angle prisms; with some modifications they can also be used for testing convergent wavefronts. (7 refs.)

105368 Multiplexed speckle and holographic interferometry with color encoding by white-light processing. P.H.Ruterbusch, J.A.Tome, F.T.S.Yu (Electrical Engng. Dept., Pennsylvania State Univ., University Park, PA, USA).
Opt. Eng. (USA), vol.22, no.4, p.501-4 (July-Aug. 1983).
A technique for multiplexing holographic and speckle interferometric images utilizing a narrow angle holographic construction scheme is presented. The image reconstruction process utilizes a white-light processing system for color encoding of interferometric fringe patterns. The property of color encoding reveals interesting interferometric aspects of the multiplexed fringe patterns. A color video system is used to provide the advantage of displaying the output interferometric images for detailed study. Experimental results of time-averaged and double exposure interferometric processes are given. This technique is ideally suited to aid in the location of the J_0 order holographic fringe. (17 refs.)

105369 Nonlinear antiresonant ring interferometer. K.Otsuka (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
Opt. Lett. (USA), vol.8, no.9, p.471-3 (Sept. 1983).
A beam-slitter ring-mirror configuration employing a Kerr-like nonlinear medium, that is a nonlinear antiresonant ring interferometer, is proposed for several optical functional devices. The basic idea behind the configuration is derived from the formation of a nonlinear refractive-index grating in a Kerr-like medium inside the unbalanced ring. (7 refs.)

105370 Applications of fiber optics in sensors. J.E.Donovan, T.G.Giallorenzi, J.A.Bucaro (Naval Res. Lab., Washington, DC, USA).
Electro/81 Conference Record, New York, USA, 7-9 April 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.8b/4/1-14
The US Navy is developing an optical technology base that, if successful, will permit detection of acoustic, magnetic, thermal, rotational, acceleration or electromagnetic fields by means of the modulation of the optical beam in a fiber. Successful prosecution of this technology will permit detection thresholds many orders of magnitude lower than is presently possible with state-of-the-art sensors. Although acousto-optic sensing is selected for the thrust of the effort, the critical aspects of the technology development are common to many sensors. (9 refs.)

07.62 DETECTION OF RADIATION (BOLOMETERS, PHOTOELECTRIC CELLS, I.R. AND SUBMILLIMETRE WAVES DETECTION)

105371 Modulation-doped $Ga_{0.47}In_{0.53}As/Al_{0.48}In_{0.52}As$ planar photoconductive detectors for 1.0-1.55-μm applications. C.Y.Chen, Y.M.Pang, P.A.Garbinski, A.Y.Cho, K.Alavi (Bell Labs., Murray Hill, NY, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.308-10 (1 Aug. 1983).
The authors demonstrate a $Ga_{0.47}In_{0.53}As/Al_{0.48}In_{0.52}As$ modulation-doped photoconductive detector. The detector has a built-in electric field to separate photogenerated electron-hole pairs. This allows the electron lifetime to be precisely determined by electrode spacings. When tested by a 100-ps, $\lambda=1.3$ μm laser pulse, the detector shows an internal gain of 18, a peak external quantum efficiency of 300%, a rise time of 80 ps, a full width at half-maximum of 250 ps, and an internal gain-bandwidth product of 72 GHz. Typical devices have 4-μm spacings between electrodes and 94-μm widths. The detector has a spectral response between 0.6 and 1.65 μm with a dip at 0.86 μm. The authors also measured the noise power of the detector at room temperature. With its capability to be integrated with a modulation-doped field-effect transistor, this detector can be useful in a monolithic integrated photoreceiver. (17 refs.)

105372 Infrared sensor for remote temperature monitoring of solar thermal central receivers. D.W.Warren (Aerospace Corp., Los Angeles, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.112-21 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
At the Barstow 10 MW Solar Thermal Pilot Plant, water is converted to high pressure steam by concentrated solar radiation. The design of the elements in which the boiling takes place makes them vulnerable to blockage by particulates contaminating the circulating water. Concern over the potential for heat damage to blocked boiler elements has led to the development of a remote optical monitoring system for use at the Pilot Plant. The system employs a telescope and infrared vidicon to detect the increased blackbody radiant emittance produced by an overheated element. An image is provided with spatial and thermal resolution sufficient to detect and identify a single blocked element. Design considerations for such a system are discussed, as are performance at the Pilot Plant and possible extensions of the system to more sophisticated pyrometric tasks. (no refs.)

105373 Detection range computation by convolution for infrared detectors. K.Tomiyama (Dept. of Electrical Engng., Pennsylvania State Univ., University Park, PA, USA), J.H.Pierluissi, J.T.Hall.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.157-64 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
A detection range computation code which utilizes the Newton's recursive algorithm and the spectral convolution of the target and background emissions with atmospheric transmittance and detector sensitivity was developed and verified using near infrared laboratory measurements. (5 refs.)

105374 Remote method for measuring the temperature of objects irradiated by lateral sources. N.K.Belozerov (All-Union Sci.-Res. Inst. of Complex Problems of Polygraphy, Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1275-9 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.811-17 (Nov. 1982). [received: Sept. 1983]
Relations are proposed for calculating the true temperature of bodies from indications of radiation pyrometers sited on a reference object and the object being measured, and the possibilities for efficient use of these relations are analyzed. (9 refs.)

105375 Measuring unmodulated and modulated optical radiation using large-area photoelements. K.W.Bonfig, E.Kramp (Inst. fur Messtech., Univ. Gesamthochschule, Siegen, Germany).
Mess. & Pruef. (Germany), vol.19, no.6, p.324-7 (June 1983). In German.
The behaviour of large-area Si-photoelements is analysed, considering their response to unmodulated and modulated radiation in the visible wavelength region. It is shown that with suitable operational amplifiers, the output signal for unmodulated light is proportional to the incident radiation intensity, whereas for modulated (e.g. pulsed) light the circuits exhibit a band-pass behaviour, caused by the large capacity of the barrier-layers of the detectors. Circuit designs optimising the band-pass quality are discussed. (6 refs.) *S.R.*

105376 Radiometric design of the level control instruments based on gamma photon backscattering. G.Ochiana, M.Oncescu, C.Popescu (Central Inst. of Phys., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.6, p.489-97 (1983).
A mathematical modelling method for radiometric design of the level control devices based on gamma backscattering is presented. A Monte Carlo treatment of the detection probability components has been applied to obtain a formula for the source activity prediction. For the investigated geometry, the tank wall and the contained liquid were approximated as plane parallel layers. The calculations performed by the elaborated computer program have been made for a point source considering the following variable parameters: initial photon energy, tank wall thickness, source-detector distance. From the obtained results an optimization study of the source detector arrangement in the form convenient for practical use can be achieved. (6 refs.)

07.65 OPTICAL SPECTROSCOPY AND SPECTROMETERS

(inc. photoacoustic spectroscopy)

105377 System analysis and time delay spectrometry. II. H.Biering, O.Z.Pedersen.
Bruel & Kjaer Tech. Rev. (Denmark), no.2, p.3-45 (1983).
For pt.I see ibid., no.1 (1983). Time Delay Spectrometry (TDS) is a relatively new method for measurement of system response. Based on a linear sine sweep it optimizes measurement performance eliminating some earlier drawbacks of swept measurements. By its nature this method tempts one to adopt an identical complex description in the time and frequency domains. The present part deals specifically with the TDS technique and its practical implementation in the B&K Time Delay Spectrometry System Type 9550. It is shown that the analysis carried out is similar, although not identical to standard correlation analysis techniques. The theoretical limitations of the techniques are evaluated from an intuitive point of view and are confirmed by a more rigorous mathematical approach. (2 refs.)

105378 Longitudinal Ramsey-Fringe spectroscopy in a calcium beam. J.J.Snyder, J.Helmcke, D.Zevgolis (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).
Appl. Phys. B (Germany), vol.B32, no.1, p.25-31 (Sept. 1983).
For ultra-high resolution spectroscopic applications such as optical frequency standards, the value of thermal sources such as atomic beams is currently limited by second-order Doppler broadening. The use of a longitudinal interaction geometry in which an atomic beam crosses the counter-propagating laser fields at a small angle is able to reduce second-order Doppler broadening to an insignificant level as well as to provide long interaction times without the necessity of large-diameter optical beams. The authors have analyzed this geometry for the case of the long-lived calcium intercombination line, and conclude that when combined with pulsed (Ramsey) excitation, the longitudinal interaction geometry could be used with a thermal calcium beam to create an optical frequency standard with a reproducibility of the order of 10^{-14} for a few seconds averaging time. The authors' initial experimental results have demonstrated the first use of the longitudinal geometry. (29 refs.)

105379 A new probe of the optical properties of surfaces. M.A.Olmstead, N.M.Amer (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.751-3 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The authors have developed a new technique, photothermal displacement spectroscopy, for studying the optical and thermal properties of surfaces. The ability to distinguish surface and bulk optical absorptions is demonstrated. The signal is directly proportional to the surface absorption coefficient and is insensitive to variations in the real part of the dielectric constant. (7 refs.)

105380 LAS-02 laser dispersed-phase photoelectric analyzer. Yu.V.Zhulanov, P.Yu.Makaveev, O.N.Nikitin, I.A.Nevskii, V.V.Vetrov.
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1478-81 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.147-50 (Nov.-Dec. 1982).
A laser photoelectric spectrometer is described for analyzing a dispersed phase in a gas. The basic parameters have been improved by using the beam within the cavity of an LG-78 small He+Ne laser. When the spectrometer has been calibrated with monodisperse latex particles, it is possible to record particles of diameter down to 0.1 μm. The resolving power is 3.5-40%. The maximum particle concentration is 2×10^4 cm^{-3}. (9 refs.)

105381 Spectropolarimeter with electromechanical compensation. A.A.Leksikov, Yu.M.Fedorov, A.E.Aksenov (Inst. of Phys., Academy of Sci., Krasnoyarsk, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1522-4 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.186-7 (Nov.-Dec. 1982).
The automatic spectropolarimeter, with electromechanical compensation of the rotation of the polarization plane of the light, is based on a KSP-4 recording potentiometer. Because of the application of stabilizing feedback, introduced from the rotation sensor, a sensitivity of 0.005° has been achieved. (7 refs.)

105382 Spring-loaded parallelogram for the scanning mirror of a low-resolution Fourier spectrometer. A.I.Andreev, V.V.Arkhipov, G.G.Gorbunov.
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1524-6 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.187-9 (Nov.-Dec. 1982).
Describes a spring-loaded precision guide of the parallelogram type for a fast-scanning Fourier spectrometer. During translational motion of the scanning mirror by 3-4 mm this guide ensures that the mirror orientation is maintained with an accuracy no worse than 2″. (4 refs.)

105383 A readily portable source unit for the calibration of Dobson ozone spectrophotometer wedges. E.L.Simmons, J.M.Regan (Meteorological Office, Bracknell, England).
J. Phys. E (GB), vol.16, no.9, p.825-6 (Sept. 1983).
The calibration source unit makes use of a single 24 V, 10 A, DC power supply which many operators of the Dobson ozone spectrophotometer will have at each station. It provides a stable, high-intensity, easily adjusted illumination such that the wedge is uniformly illuminated and the distribution of light on the photomultiplier cathode of the spectrophotometer remains practically unchanged throughout the calibration cycle. Its mass is 2.5 kg. (1 ref.)

105384 Zeeman atomic absorption spectroscopy. E.L.Al'tman, G.B.Sveshnikov, Yu.I.Turkin, S.E.Sholupov.
J. Appl. Spectrosc. (USA), vol.37, no.5, p.1209-19 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.709-22 (Nov. 1982). [received: Sept. 1983]
Further development of atomic absorption spectroscopy (AAS) as a powerful tool for physical investigations and as an analytical method involves, in particular, elimination of the preliminary chemical preparation of specimens and improving methods for including nonselective absorption. Exact compensation of nonselective noise will increase the effectiveness of the analysis and will permit reaching the detection limits characteristic of correction-free methods. Various methods have been developed in the past for including nonselective absorption: using close-lying nonresonant lines, using a source of continuous spectrum wavelength modulation of the radiation from the light source, using the wings of a self-reversed emission line, scanning the absorption line contour with a narrow laser line, and using two isotopes of a single element. The use of the Zeeman effect is well known in atomic spectroscopy. This effect permits solving these problems most simply. (76 refs.)

105385 Aberrations in off-plane spectrometers. M.A.Gil, J.M.Simon (Dept. de Fisica, Univ. de Buenos Aires, Buenos Aires, Argentina).
Opt. Acta (GB), vol.30, no.9, p.1287-301 (Sept. 1983).
The aberrations of two off-plane spectrometers that used parabolic mirrors, the Ebert and the Littrow, are calculated. This completes a comparative study undertaken by the authors of all the plane grating spectrometers with one mirror in the camera and another in the collimator, which makes it possible to establish clearly the optimal field of application for each design. (19 refs.)

105386 Wide-band acoustooptical spectral analyzer of the autocollimation type. I.A.Vodovatov, M.G.Vysotskii, S.A.Rogov (M.I. Kalinin Polytech. Inst., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.256-7 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.408-10 (Feb. 1983). [received: Sept. 1983]
Acoustooptical spectral analyzers are among the most promising coherent-optical devices. Their great bandwidth, high speed, and capability of simultaneously recording the spectra of many signals often make them superior to purely electronic spectral analyzers. Autocollimating spectral analyzers form a class apart among the acoustooptical spectral analyzers. In these devices, a reflecting mirror is mounted beyond the acoustooptical modulator and the collimating objective also serves to integrate the light beams. Autocollimating systems are used because of their reduced size and cost, and also because the acoustooptical interaction length is doubled. However, it must be remembered when designing autocollimating spectral analyzers that the output signal is a sum of the two beams produced by light diffraction by the modulator in both the forward and backward directions of the incident light beam. The bandwidth is limited by the interference of these two beams. (2 refs.)

105387 Raman difference spectroscopy. J.Laane (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).
In book: *Vibrational spectra and structure. A series of advances. Vol.12*, J.R.Durig [Ed.], p.405-67. Amsterdam, Netherlands: Elsevier (1983), xvi+497 pp. [0 444 42197 1]
Raman difference spectroscopy (RDS) allows the recording of difference spectra resulting from spectral subtraction. In addition to allowing the cancellation of unwanted components of the spectra, RDS also has utility for (at least) two other purposes. It can greatly simplify polarization measurements so that the isotropic and anisotropic components of the Raman signals may be recorded directly. Furthermore, RDS may be used to measure very precisely small frequency or bandwidth differences between similar samples. For example, solvent shifts and isotopically induced frequency shifts may be measured from the analysis of the difference spectra. In this review the instrumentation developed for RDS will first be described. The theory necessary for determining the frequency shifts and bandwidth changes and for analyzing polarization effects will be developed, and some of the applications described. The latter section will emphasize the measurements utilizing the theoretical principles. (50 refs.)

07.68 PHOTOGRAPHY, PHOTOGRAPHIC INSTRUMENTS AND TECHNIQUES

(for light sensitive materials see also 42.70)

105389 Chemographic images of silicon surfaces. I.A.Blech (Palo Alto Res. Center, Xerox Corp., Palo Alto, CA, USA), E.S.Meieran.
Appl. Phys. Lett. (USA), vol.43, no.4, p.396-8 (15 Aug. 1983).
Images are obtained when freshly etched or abraded silicon wafers are placed in contact with photographic plates. Based on the study of the images it was concluded that the images form due to a neutral chemical species, probably atomic hydrogen, that is emitted from the silicon surface during the initial stage of oxidation. These chemographic images are a chemical parallel to normal autoradiographs. This letter describes experimental verification of the model and discusses possible uses of the technique. (19 refs.)

105390 Hypersensitization of Kodak IIIa-J plates by baking in forming gas in a sealed tube. T.Sasaki (Dept. of Astron., Univ. of Kyoto, Kyoto, Japan).
AAS Photo-Bull. (USA), no.32, p.3-7 (1983).
Kodak spectroscopic plates, type IIIa-J, were hypersensitized by baking in forming gas (92% N_2, 8% H_2) in a sealed tube. Various temperatures and times were tested to find the optimum baking conditions as indicated by relative detective quantum efficiency measurements. If a number of plates were baked simultaneously in the sealed tube, the speed gain decreased and the fog increased. Effects of lapsed time between baking and exposure, and also of different developers, were examined. (16 refs.)

105391 An investigation into latent image and hypersensitization decay of Kodak IIIa-J and IIIa-F photographic plates. S.A.Butchins (Dept. of Astrophys., Univ. of Oxford, Oxford, England).
AAS Photo-Bull. (USA), no.32, p.8-13 (1983).
In critical work such as photographic surface photometry, significant errors can be introduced by latent image decay and/or decay of hypersensitization. The present paper investigates such errors for Kodak spectroscopic plates, types IIIa-J and IIIa-F, and suggests methods of mitigating them. (5 refs.)

105392 The variation with wavelength of the response of Kodak emulsion, IIIa-J. R.G.Clowes (Dept. of Phys., Univ. of Durham, Durham, England).
AAS Photo-Bull. (USA), no.32, p.14-15 (1983).
The variation with wavelength of the response of hypersensitized and unhypersensitized Kodak emulsion, type IIIa-J, has been studied using UK Schmidt Telescope calibration spectrograms for five emulsion batches. (4 refs.)

105393 A 35 and 70 mm stereoanalytic compilation-graphic system. H.Dell Foster (H. Dell Foster Assoc., San Antonio, TX, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.361, p.53-8 (1983). (Biostereometrics '82, San Diego, CA, USA, 24-27 Aug. 1982).
Photogrammetry in conventional practice requires the use of fixed focus cameras of high precision and calibrated internal geometry. The largest historical application of programmetry is aerial topographic mapping. Serious efforts have been made to apply photogrammetry for non topographic purposes (terrestrial photogrammetry) by utilisation of conventional or scaled down cameras and stereo compilation instruments with various hardware and applications schemes. Success has been limited, at best, and the solutions have not been economical enough to warrant broad application. With the advent of digital computers, the evolution of numerical photogrammetry in general and the analytic stereo compiler in particular the technical tools are available for a truly comprehensive universal system. With miniaturisation and new mathematical techniques small commercial non-precision cameras can be utilised and the photogrammetric process can be greatly simplified and extended to broader application. (2 refs.)

105394 Color facsimile and color copying machine. K.Kubota (Faculty of Engng., Seikei Univ., Tokyo, Japan).
J. Inst. Telev. Eng. Jpn. (Japan), vol.37, no.3, p.178-85 (March 1983). In Japanese.
Growing attention has been given to color facsimile reception. A new color recording method is that using a color ink-jet printer. Ink is fed under pressure to nozzles excited with an ultrasonic signal. Ultrasonic excitation produces a standing wave on the stream of ink issuing from each nozzle, breaking it up into individual drops. Writing signals on the electrode pair are timed to charge the microdrops. The drops deflected by a constant-voltage difference between the electrodes, clear a gutter, and strike the paper. The uncharged microdrops are collected and recycled. In color ink-jet facsimile reception, the printer uses four ink jets, one for each of the three process colours—yellow, magenta, and cyan—and a fourth for black. Some other printers and color facsimile transmission are described in this paper. (21 refs.) *K.B.*

105395 Motion-picture test signals for subjective evaluation of high efficiency coding of TV signals. H.Murakami (Kokusai Denshin Denwa Co. Ltd., Tokyo, Japan), T.Shimizu.
J. Inst. Telev. Eng. Jpn. (Japan), vol.37, no.3, p.195-200 (March 1983). In Japanese.
Animated-image test pattern signals for evaluating encoding of TV signals were prepared jointly by KDD (Kokusai Denshin Denwa) and TBS (Tokyo Broadcasting System). Fundamentally, parameters characterizing animated images include: (1) movement rate, (2) camera operation mode, (3) pattern roughness, (4) signal-to-noise ratio, and (5) color hue. By combining these parameters, 26 evaluation images were chosen, which may be used to evaluate most of the image patterns in ordinary TV programs. Their typical applications are given in this paper. (9 refs.) *K.B.*

105396 The theoretical influence of Gaussian grain size distributions on the characteristic curve of photographic film. K.Nakamura (Dept. of Electro Photo-Optics, Tokai Univ., Kanagawa, Japan).
J. Appl. Photogr. Eng. (USA), vol.9, no.4, p.113-16 (Aug. 1983).
The characteristic sensitivity curves of silver halide emulsions are obtained by a theoretical calculation. The grain size distribution of the emulsion is assumed to be Gaussian. An advantage of the present calculation is that a value of sensitivity of a film can be derived as a reverse of the exposure unit (lux-sec), which corresponds with the conventional ASA sensitivity. A typical emulsion film whose Gaussian distribution constant is 10 μ^{-4} and a peak grain size of 0.5 μ has a sensitivity of 1200 assuming the present standard DQE loss factor. It is an appropriate way to adopt a double Gaussian distribution emulsion in order to control the γ-value in the characteristic curve. (13 refs.)

105397 Silver dye-bleach colour microfilm. A.Meyer (Ilford AG, Fribourg, Switzerland).
J. Appl. Photogr. Eng. (USA), vol.9, no.4, p.117-20 (Aug. 1983).
Silver dye-bleach materials offer the advantages of high sharpness, simple three-solution direct-positive processing, and very good stability of the azo image dyes. Based on these features various models of microfilm with very

thin layers have been developed. The light scattering effects in the imaging layers were investigated, and based on these findings the layer structure was modified in order to improve acutance. The layer and image structure, processing, and photographic properties including resolving power, colour reproduction and permanence in dark and light storage are discussed. (7 refs.)

105398 The stability and permanence of Cibachrome images. A.Meyer, D.Bermane (Ilford AG, Fribourg, Switzerland).
J. Appl. Photogr. Eng. (USA), vol.9, no.4, p.121-5 (Aug. 1983).
Factors influencing the fading of Cibachrome materials in the dark and upon exposure to light are discussed. Very long testing periods are required to study the dark fading process at temperatures up to 77°C and 60% relative humidity (RH). After 112 days at 77°C/40% RH hardly significant density changes could be observed. Above 80°C and 70% RH the absorption spectra of the Cibachrome azo dyes change noticeably within a week. This is mainly due to partial deaggregation of the azo dyes into monomers. This deaggregating process is reversible, as shown by experiments. Even at 91°C/90% RH the irreversible chemical degradation is very slow. Comparative data regarding the light fading properties are also given. They prove the excellent stability of the azo dyes toward photo-oxidation. (7 refs.)

105399 High-speed shutter for single lens reflex cameras. Y.Nakano, H.Kato, T.Tsuda, E.Tanaka (Nippon Kogaku KK, Tokyo, Japan).
J. Appl. Photogr. Eng. (USA), vol.9, no.4, p.126-8 (Aug. 1983).
A focal-plane shutter having high-speed travelling blades has been designed and incorporated with Nikon FE2 cameras. This new shutter offers a top shutter speed of ${}^{1}/_{4000}$ sec and a maximum electronic flash sync speed of ${}^{1}/_{250}$ sec. The shutter has been realised by selection of an effective travelling system of the blades and use of lightweight material. A blade using titanium has a honeycomb-like pattern by chemical etching and has only ${}^{2}/_{5}$ weight of a conventional steel one. This blade maintains both rigidity and tenacity by nitriding of titanium surface. (3 refs.)

105400 Use of charge injection device components in still cameras. J.Carbone, D.Hunter (General Electric Co., Syracuse, NY, USA).
J. Appl. Photogr. Eng. (USA), vol.9, no.4, p.129-31 (Aug. 1983).
Recent breakthroughs in charge injection device (CID) imaging technology have resulted in the fabrication and operation of a new generation of CID imagers and ancillary LSI based subsystems. The imagers are highly sensitive low temporal noise devices featuring electro optical quantum efficiencies of 44-55% in the visible spectrum (400 through 600 nm). Coupled with the many structural and flexible readout advantages of CID imagers, these subsystems may be combined to fabricate high performance, low cost, light weight, and rugged monochrome and colour solid state camera modules which are suitable for application in the fields of: still photography, professional and/or consumer video, and automation. (5 refs.)

105401 A review of the application of UV-absorbers in colour recording materials. H.Langen (Agfa-Gevaert AG, Leverkusen, Germany).
J. Appl. Photogr. Eng. (USA), vol.9, no.4, p.132-4 (Aug. 1983).
It is well known that UV-absorbers improve the light fastness of photographic colour papers, however, it is less known that they are also of great importance in camera original colour recording materials. There are many ways that UV absorbing layers can cause an improvement in image quality. The benefits obtained through the presence of UV-protection in the different stages of producing photographs from exposure to the final image are discussed. (11 refs.)

105402 Gilding and sealing daguerreotypes. M.S.Barger, R.Messier, W.B.White (Materials Res. Lab., Pennsylvania State University, University Park, PA, USA).
Photogr. Sci. & Eng. (USA), vol.27, no.4, p.141-6 (July-Aug. 1983).
The gilding step was added to the daguerreotype process in 1840 by Fizeau who discovered that when a daguerreotype was treated in a solution of hot gold chloride and sodium thiosulfate, both its mechanical and optical properties were improved. This improvement in properties is due to the accelerated hardening of the amalgam image particles that make up the image and to the slight alteration of the daguerreian microstructure that results from the gilding process. In the gilding process gold preferentially replaces mercury over silver, resulting in an uneven dispersion of gold over the daguerreotype surface with a concentration of gold in areas of high image particle density. Although a protective function has gradually been implied for the gilding process in daguerreotypes, gilding does not protect daguerreotypes from silver sulfide corrosion. While gold toning, the modern outgrowth of gilding, does prevent sulfiding, the daguerreotype presents other problems not found in conventional silver halide systems. The entire daguerreotype may act as an electrode in the silver sulfide corrosion so partial covering of the silver electrolyte by the nonuniform gold layer is not effective in prevention of corrosion. A uniform coating of gold is a good choice for the sealing of a daguerreotype from silver sulfide corrosion and its use is described. (14 refs.)

105403 Dry etching of polymer coatings by deep ultraviolet irradiation. K.Sugita, N.Ueno, S.Konishi, Y.Suzuki (Dept. of Image Sci. & Technol., Chiba Univ., Chiba, Japan).
Photogr. Sci. & Eng. (USA), vol.27, no.4, p.146-9 (July-Aug. 1983).
Various commercially available positive working resists were irradiated in air with a deuterium discharge lamp which emitted continuous light of wavelength longer than 1800 A. It was found that most resist films studied were etched by UV irradiation without any subsequent processing, and that the etching rate was highest with poly-(2,2,3,4,4,4-hexafluorobutyl methacrylate). PFHMA [poly-(3,3,4,4,5,5,6,6,6-nonafluorohexyl methacrylate)] and copolymers with methyl methacrylate were prepared, and the etching rate was observed for changes of temperature and pressure of the ambient gas. When resist films of 30 or 50 mol % FHMA copolymer were irradiated at 60°C in a vacuum of 0.4 torr, the etching depth was 1300 Å after 5 min and 2400 Å after 10 min. This UV-etching is suitable as a dry method for resist patterning or descumming as well as for resist stripping. A line-and-space pattern of 1 μm width was clearly transferred to the resist film. (8 refs.)

105404 Thermophotographic characteristics of phenanthrene. P.K.C.Pillai, A.K.Tripathi (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
Photogr. Sci. & Eng. (USA), vol.27, no.4, p.150-2 (July-Aug. 1983).
Solution cast films of phenanthrene, using polystyrene allyl alcohol as binder have been tested for electrothermophotographic use. It has been observed that a 40:60 weight ratio of phenanthrene and binder is suitable for electrothermophotography. The acceptance potential for this ratio is found to be 1200 v and the contrast potential is 800 v. (10 refs.)

105405 A variable-temperature vacuum sensitometer for studying the temperature dependence of photographic sensitivity. R.K.Hailstone (Res. Lab., Eastman Kodak Co., Rochester, NY, USA).
Photogr. Sci. & Eng. (USA), vol.27, no.4, p.152-5 (July-Aug. 1983).
The design and operation of a variable-temperature vacuum sensitometer are described. Up to 12 film strips can be exposed sequentially during a cycle of operation. Temperature of the film at the time of exposure can be varied from −196 to 100°C with temperature regulation of ±1°C. A calibrated light source allows quantum sensitivities to be determined. Provisions for Herschel-effect experiments were also included in the design of the sensitometer. Results for the dye 5,5′-dichloro-3,3′,9-triethylthiacarbocyanine bromide on a 0.2-μm iridium-doped Ag(I)Br emulsion suggest that dye-promoted secondary processes are negligible in this dye-emulsion system after vacuum outgassing. (11 refs.)

105406 Researching and restoring pioneer talking pictures: the 70th anniversary of the theatrical release of Kinetophone. A.Shifrin (Abekas Video Systems Inc., San Carlos, CA, USA).
SMPTE J. (USA), vol.92, no.7, p.739-51 (July 1983).
This article attempts to clarify some of the obscure beginnings of sound motion pictures, utilizing new information recently uncovered about Edison's work in this medium. Two technical perspectives are pursued. One describes Kinetophone, and the other explains the use of modern audio, film, and video technologies to generate picture and sound with qualities much better than are presumed possible for productions of this vintage. (53 refs.)

105407 Today's photographic imaging technology for tomorrow's HDTV system. M.A.Kriss, J.Liang (Eastman Kodak Co., Rochester, NY, USA).
SMPTE J. (USA), vol.92, no.8, p.804-18 (Aug. 1983).
Film and television have been partners for more than 35 years. During this time great improvements have been made in both media, with the public receiving most of the benefits. With high-definition television (HDTV) now possible, film as an originating medium is more important than ever. Eastman color negative film 5247, the 35-mm motion-picture format, will support HDTV systems up to 1400 lines at 50 MHz and may support up to a 2000-line HDTV system; it will provide an input signal with a signal-to-noise ratio >50 dB (unweighted). High-speed digital image processing makes film an even more valuable origination source because of its wide exposure latitude and the manufacturers' ability to manipulate film speed, exposure, latitude, sharpness, and granularity to provide an optimum recording medium for all forms of television and motion-picture production. (9 refs.)

105408 Film stocks used for optical special effects. R.Field, T.Iles.
SMPTE J. (USA), vol.92, no.8, p.819-23 (Aug. 1983).
Describes the wide range of film stocks used for optical special effects work in motion pictures. The use of traveling mattes and painted mattes is discussed, as well as the problems of matching contemporary work with that from archival sources. The properties of the various films used are described, together with reasons for their selection and application. The article is illustrated with examples from various films employing optical trick photography. (1 ref.)

105409 EBU activity in the standardization of films for television and television film-scanners. M.Rotthaler (Inst. fur Rundfunktech., Munich, Germany).
SMPTE J. (USA), vol.92, no.8, p.849-55 (Aug. 1983).
Reports on the work being done by the European Broadcasting Union (EBU) to promote optimum technical standards for television programs exchanged in the form of films between broadcasting organizations in different countries. It discusses the characteristics of the films used in the programs, and recommends practices for the technical operation, alignment, and measurement of television film-scanners. (12 refs.)

105410 Some SEM studies on photographic emulsions. G.Bast, G.Haase, F.Zorgiebel (Inst. fur Wissenschaftliche Photographie, Tech. Univ. Munchen, Garching, Germany).
Scanning (Germany), vol.5, no.2, p.84-90 (1983).
The SEM micrographs of small silver halide crystals in photographic emulsions, previously published by Platzer and Greenhut (1976) and by Furman et al. (1981) show only a very restricted resolution of morphological details. The aim of the present investigation was to obtain SEM micrographs of a high quality to reveal the fine structure of silver halide grains. Examples are given of photographic model emulsions both fresh and developed, manufactured in the authors' laboratory, and of morphological studies on the chemical and physical development of commercially available photographic films. (8 refs.)

105411 A new halide lamp for film printers. I.D.Belova, S.K.Nazarov, V.F.Piyavskii, I.O.Yavno.
Tekh. Kino & Telev. (USSR), no.6, p.28-32 (June 1983). In Russian.
The technical specifications of a new domestic-designed halide lamp KTM 120-1200 are briefly outlined. (5 refs.)

07.75 MASS SPECTROMETERS AND MASS SPECTROMETRY TECHNIQUES

(for mass spectroscopic chemical analysis, see 82.80)

105412 A ^{252}Cf fission fragment-induced desorption mass spectrometer: design, operation and performance. H.Danigel, H.Jungclas, L.Schmidt (Fachbereich Phys. Chem., Philipps-Univ., Margburg, Germany).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.223-40 (1 Sept. 1983).
This time-of-flight mass spectrometer utilizes the ^{252}Cf fission fragment induced ionization of organic solids and electrostatic desorption. It is designed for the high sensitivity needed in the quantitative analysis of pharmaceuticals and can be combined with a high-performance liquid chromatograph. The solute emerges into a rough vacuum stage sampling up to twelve fractions in a vacuum-drying process. Samples with low vapor pressure are introduced periodically into the ion source by means of an interfacing disk and analysed successively. The sensitivity of ion detection employing conversion electrons and microchannel plates is investigated. The performance of the mass spectrometer is discussed in terms of mass resolution, efficiency and reproducibility. (23 refs.)

105413 Membrane inlet for ion mobility spectrometry (plasma chromatography). G.E.Spangler, J.P.Carrico (Bendix EPID, Baltimore, USA).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.267-87 (1 Sept. 1983).
Reactant-ion distributions in ion mobility spectrometry (IMS) with a membrane inlet system have been studied using ion mobility spectrometry/mass spectrometry (IMS/MS). The membrane was able to exclude the water and ammonia components of laboratory air from the carrier gas of the instrument, but not carbon dioxide. Nonporous dimethylsilicone membranes exclude these components more effectively than microporous polypropylene membranes. (35 refs.)

105414 Evaluation of an electrostatically-collimated ion source in an isotopic-ratio mass spectrometer. V.V.K.Rama Rao, C.K.Nazare, B.S.Prahallada Rao (Tech. Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.289-98 (1 Sept. 1983).
Electrostatic collimation or focusing of the electron beam has been used in the ion source of an isotope-ratio mass spectrometer and its performance evaluated. The design details of the ion source and the mass spectrometer are given. The sensitivity is comparable to that in the magnetic collimation mode. The reproducibility of the sensitivity with electrostatic collimation for various filament assemblies is good. The output vs. pressure curves determined for electrostatic collimation, magnetic collimation and a combined electrostatic and magnetic collimation show good linearity. This combined field collimation is also found to give good sensitivity, comparable to the conventional source, but at a much lower electron emission. The electrostatically-collimated ion source was used for precision isotope ratio determinations of nitrogen gas samples collected from a cylinder. The relative internal standard deviation on a single sample ratio was better than 0.025%. The relative external standard deviation for repeated analysis of 19 samples drawn from the same cylinder over an 8-hour period was 0.08%. The advantages of using such an ion source are listed. (9 refs.)

105415 Improved performance in angle-resolved mass spectrometry. S.Verma, J.D.Ciupek, R.G.Cooks (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA), A.E.Schoen, P.Dobberstein.
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.311-18 (1 Sept. 1983).
A new experimental arrangement for angle-resolved mass spectrometry is described featuring a needle which delivers collision gas to the source slit of a reversed geometry mass spectrometer. In this experiment the scattering angle is defined by pre-collision electrical deflection of the parent ion beam, as contrasted with post-collision selection of the direction of the daughter ion beam. Advantages are rapid access to any desired angle, coupled with an improvement in ion intensity and in angular resolution evident from measured breakdown curves. Collision-induced dissociation spectra of the methanol molecular ion, recorded over a range of scattering angles, agree well with previous results. Experiments which record ions that survive collisions, i.e. scatter without fragmentation, indicate that scattering of polyatomic ions through substantial angles (0-6°) makes a significant contribution to the phenomena underlying angle-resolved mass spectrometry. (19 refs.)

105416 A general approach to calculating isotopic distributions for mass spectrometry. J.A.Yergey (Middle Atlantic Mass Spectrometry Facility, Johns Hopkins School of Medicine, Baltimore, MD, USA).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.337-49 (1 Sept. 1983).
Fundamental principles for obtaining mass spectral isotopic distributions are applied to a general computer program which can be used to calculate and present in tabular and graphic form the isotopic contributions for any molecular formula. A unique feature is the retention of the isotopic distribution, exact mass, and absolute abundance for all individual peaks at each mass. Special considerations have been made for the large number of isotopic combinations which occur for many higher mass compounds. The computer program accepts the input of a molecular formula followed by interactive input of a number of parameters which affect the final presentation of the theoretical distribution profile. (21 refs.)

07.77 PARTICLE BEAM PRODUCTION AND HANDLING; TARGETS

(see also 29.25 in elementary-particle and nuclear physics, 41.80 Particle beams and particle optics)

105417 Electron-beam guiding and phase-mix damping by an electrostatically charged wire. D.S.Prono, G.J.Caporaso, A.G.Cole, R.J.Briggs, Y.P.Chong, J.C.Clark, R.E.Hester, E.J.Lauer, R.L.Spoerlein, K.W.Struve (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.9, p.723-6 (29 Aug. 1983).
A new and relatively simple method has been developed to focus and guide electron beams without the use of a magnetic field. The scheme relies on the electrostatic charging of a highly resistive wire in the presence of a beam. The beam is then strongly guided and focused by the oppositely charged wire. In addition, the highly anharmonic nature of the wire potential leads to rapid phase-mix damping of transverse beam displacements and radial pulsations. (8 refs.)

105418 Curved neutron mirror system as an improved polariser. M.Th.Rekveldt, W.H.Kraan (Interuniv. Reactor Inst., Delft, Netherlands).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.81-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
A new neutron mirror system has been developed using Si-single crystal platelets of 200 μm thickness and area 25×50 mm^2. Layers of 0.1 μm $Fe_{85}Co_{15}$, 1 μm $Gd_{40}Ti_{60}$ and 0.1 μm $Fe_{50}Co_{50}$ have successively been deposited on the highly polished surfaces of the crystals. A stack of such Si-crystals alternated with air using 200 μm spacers at the edges of the crystals serves as a neutron soller slit mirror system. The mirrors are bent in such a way that the tangent to one mirror in the middle cuts the next mirror under an angle of β radians at the ends. An analytic expression has been derived for the intensity reflected by such a system. For $\beta \ll \theta_c$ this system reflects an angular region of $2\theta_c$ from the initial beam and for $\beta \gtrsim \theta_c$ the intensity is proportional to θ_c^3, which guarantees a much improved polarising power in comparison with a plane mirror system. Test measurements have been carried out using neutrons of wavelength 1 Å. (8 refs.)

105419 Vertically focusing Heusler alloy monochromators for polarised neutrons. A.Freund, R.Pynn, W.G.Stirling, C.M.E.Zeyen (Inst. Laue-Langevin, Grenoble, France).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.86-90 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Several vertically focusing neutron monochromators have been constructed using single crystals of Heusler alloy (Cu_2MnAl). A typical monochromator is composed of five or eight crystals, each of which measures 75×15×7 mm^3, mounted on a flexible titanium backing plate between the poles of a horizontal-field, permanent $SmCo_5$ magnet. Spatial focusing of the monochromatic beam is achieved by curving the backing plate. Neutron rocking curves of the (111) reflections of the crystals used for monochromator construction display single, symmetric peaks of about 20′ FWHM. For neutrons of wavelength $\lambda = 4$ Å the magnetised monochromator has a peak reflectivity of 73% for neutrons of the desired spin state and a measured polarising efficiency which is in excess of 95%. At $\lambda = 2.36$ Å the polarising efficiency is essentially unchanged but the peak reflectivity falls to ~50%. (15 refs.)

07.80 ELECTRON AND ION MICROSCOPES AND TECHNIQUES

(see also in condensed matter 61.16D Electron microscopy, 61.16F Field ion microscopy)

105420 Simulation of backscattered electrons by reflection of primary electrons applied to optimization of detector designs. M.Brunner (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.391-3 (15 Aug. 1983).
A method has been developed to minimize the background signal of retarding field analyzers. It uses a negative electrode or negative charge on an insulator to reflect the beam of a scanning electron microscope towards the detector. This beam simulates backscattered electrons so that the response of the detector can be studied and optimized. (2 refs.)

105421 Ion microscopy using electron-desorbed ions. P.Williams, D.A.Reed (Materials Res. Lab., Univ. of Illinois, Urbana, IL, USA), A.E.Morgan.
Appl. Surf. Sci. (Netherlands), vol.16, no.3-4, p.345-50 (July-Aug. 1983).
Electron-stimulated desorption can be used as a (quasi-)non-destructive technique in the ion microscope. This allows precise sample location for subsequent sputtering analysis and also may offer a new approach to chemical imaging of surfaces. (6 refs.)

105422 Apparatus for probing electric fields in dielectric films by the albedo method. O.V.Andreev, Yu.I.Sapozhkov, O.B.Evdokimov, B.A.Kononov, N.I.Yagushkin (Sci.-Res. Inst. of Introscopy, S.M. Kirov Polytechnic Inst., Tomsk, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1510-12 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.175-7 (Nov.-Dec. 1982).
Describes a method and apparatus for probing electric fields in dielectric films to a depth ≤ 10 mg/cm^2 with electrons possessing an energy of up to 100 keV. The method is based on the influence of the electric field on the factor of electron backscattering from a dielectric film and makes use of the UEMV-100 electron microscope. (2 refs.)

105423 Thermal chamber for physicochemical experiments in the electron microscope. N.V.Rozhanskii, V.N.Rozhanskii (Inst. of Crystallography, Acad. of Sci., Moscow, USSR).
Ind. Lab. (USA), vol.48, no.11, p.1124-6 (Nov. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.11, p.58-60 (Nov. 1982).
The described chamber was used to observe the growth of crystals from the vapor state in the electron microscope and to observe oxidation. (3 refs.)

105424 Improvements in the design of time-delay correlators. L.Basano, P.Ottonello, E.Schiavi (Istituto de Sci. Fisiche, Univ. di Genova, Genova, Italy).
J. Phys. E (GB), vol.16, no.9, p.840-3 (Sept. 1983).
Two versions of low-cost correlators, based on the principle of recording the times of arrival of photoelectron pulses, have been proposed by different

authors (Basano and Ottonello 1981, Friberg et al., 1982). Each of the proposed instruments presents its own advantages. The authors describe a correlator (in two versions) that combines in a single instrument the most interesting features of the new correlators. (10 refs.)

105425 Thermal diagnostics of pulsed 0-2 MeV electron beams and bremsstrahlung. R.Bailly-Salins (CEA-DAM, Centre d'Etudes de Valduc, Is-sur-Tille, France).

J. Phys. E (GB), vol.16, no.9, p.909-15 (Sept. 1983).

Usual calorimetric methods are set up to measure energy profiles injected into solids by irradiation with a 100 ns burst of electrons or photons. The spectral distribution of the radiations considered is spread between 0 and 2 MeV. They are absorbed by cylinders, discs or filaments made of carbon, tantalum or platinum which are connected to thermoelectrical converters. The shapes of these calorimeters and the conditions of irradiation allow one to deal with a roughly one-dimensional heat flux, despite possible thermal losses through conduction, convection and radiation. A complete set of equations is given for every calorimeter and numerical examples are performed with a calculator to help to interpret the experimental recordings. (19 refs.)

105426 Intensity and energy calibration in AES: the effect of analyser modulation. M.T.Anthony, M.P.Seah (Div. of Materials Applications, NPL, Teddington, England).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.1, p.73-86 (Aug. 1983).

To a large extent, Auger electron spectra (AES) are recorded and portrayed in the differential mode using the potential-modulation method with a phase-sensitive detector. The precise intensities of the peaks and their energy positions depend on the modulation amplitude in a nonlinear manner. This dependence, in turn, is also a function of the resolution and detailed construction of the analyser. Thus, accurate quantification and accurate assignments of peak energies depend on a detailed knowledge of the effect of analyser modulation in AES. The theoretical response of spectrometers to a Gaussian line is analysed and compared with measurements for 'singlet' peaks using several different commercial spectrometers. This shows that, in certain circumstances, the traditional methods of intensity and energy measurement can be transferred with accuracies as high as 3% and 0.05 eV, respectively. (22 refs.)

105427 An atomic standard to calibrate analyser modulation in AES. M.P.Seah, M.T.Anthony (Div. of Materials Applications, NPL, Teddington, England).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.1, p.87-97 (Aug. 1983).

For the comparison of differentiated AES spectral data produced using the potential-modulation technique and recorded under different conditions of modulation, or for the transfer of data from laboratory to laboratory, or for the quantification of spectra, the magnitude of the effective energy modulation of the analyser must be known. Even for simple analysers the modulation may differ from the generally accepted value obtained as the product of the measured modulation and the spectrometer constant. A rapid and simple method is therefore presented using the shape of the Ag $M_{4,5}NN$ doublet which enables the true analyser energy modulation to be determined to within 3%. The method is tested on a range of instruments and shows that, whilst for some CMA's the generally accepted approach works, for the Varian 10 keV beam CMA, the true modulation deduced from the atomic standard gives a value which is lower by a factor of 1.2 than that assumed previously. The method may also be used to show that the true energy modulation is 1.6 times higher than indicated throughout McGuire's Reference Manual. (11 refs.)

105428 Theory of the increase of spatial resolution efficiency of the scanning electron microscope in the beta-conductivity regime. G.V.Saparin, V.V.Filimonov, A.V.Chivilev (Dept. of Electronics, Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.76-83 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.66-72 (1982).

The authors consider a problem aimed at increasing the resolution of the scanning electron microscope in the beta-conductivity regime. By using a number of assumptions, the authors analyse the equations for the diffusion of carriers, calculate the concentration for various values of the E field and surface recombination rate during the pulse of electron current. It is shown that the volume taken up by the electron-hole pairs (the signal volume) depends strongly on the values of the E field and the surface recombination rate. It is noted that, by using the stroboscopic regime in the scanning electron microscope, one can increase the resolution in the case of beta-conductivity by a factor of 2-3. (22 refs.)

105429 Monochromatized Ag Lα X-rays as a source for higher energy XPS. K.Yates, R.H.West (V.G. Scientific Ltd., East Grinstead, England).

Surf. & Interface Anal. (GB), vol.5, no.4, p.133-8 (Aug. 1983). (International Conference on Quantitative Surface Analysis, Teddington, England, 24-25 Nov. 1981).

Monochromatization of Ag Lα X-rays is achieved by fitting an Ag anode to a conventional AlKα monochromator. Many new XPS lines are generated by this high energy source including the 1s and KLL Auger series from Al to Cl. Chemical state determination by means of the Auger parameter for these elements is greatly assisted by the reduced X-ray linewidth after monochromatization. Three glass fibre samples with different surface pre-treatments were studied to show that chemical state information could be extracted from even these complex, rough and insulating surfaces by using this novel X-ray source. (14 refs.)

105430 Calibration of an X-ray photoelectron spectrometer by means of noble metals. M.F.Ebel, H.Ebel, G.Zuba, J.Wernisch (Inst. fur Angewandte & Tech. Phys., Tech. Univ. Wien, Wien, Austria).

Surf. & Interface Anal. (GB), vol.5, no.4, p.170-1 (Aug. 1983). (International Conference on Quantitative Surface Analysis, Teddington, England, 24-25 Nov. 1981).

A review of the literature concerning binding energies of noble metal core levels has been carried out. From this data values for energy calibration in electron spectroscopy are recommended. (19 refs.)

105431 A single crystal of $YAlO_3$:Ce^{3+} as a fast scintillator in SEM. R.Autrata (Inst. of Sci. Instruments, Czechoslovak Acad. of Sci., Brno, Czechoslovakia), P.Schauer, J.Kvapil, J.Kvapil.

Scanning (Germany), vol.5, no.2, p.91-6 (1983).

Presents a new single-crystal scintillator intended for applications in a scanning electron microscope (SEM). It is a single-crystal disc of yttrium aluminium perovskite activated by trivalent cerium free of traces of Fe ions. The single crystals of $YAlO_3$:Ce^{3+} (YAP:Ce^{3+}) were prepared by the Czochralski method in a reducing atmosphere of Ar and H_2 with an excess amount of Y^{3+} ions. Effective methods of purification and purity control of the raw material are described. The highest achievable concentration of Ce^{3+} ions in as grown crystals amounted to 0.3 wt%, concentration in the melt was 8-9 times higher. The best properties were found with samples of the maximum possible concentration of Ce^{3+}. Compared with the previous aluminate $Y_3Al_5O_{12}$:Ce^{3+} (YAG:Ce^{3+}) these samples showed higher efficiency, a shorter decay time of luminescence (40 ns) and an emission band in a more advantageous spectral region (378 nm). Because of high resistance to radiation damage, high chemical resistance and applicability to ultra-high vacuum it is also suitable for detection of other kinds of ionizing radiation. (18 refs.)

105432 Ultrahigh vacuum system for a scanning Auger microprobe. A.V.Korgaonkar, C.P.Gopalaraman, W.C.J.Carvalho (Tech. Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).

Vac News (India), vol.13, no.2, p.16-19 (June 1982). [received: Aug. 1983]

Describes a UHV system built for scanning Auger microprobe (SAM), in which samples can be treated separately in a sample preparation chamber and then transferred to the spectrometer chamber maintained at a lower pressure. The ultimate pressure obtained in spectrometer chamber is 5×10^{-10} Torr and in the sample preparation chamber is 2×10^{-9} Torr. (2 refs.)

07.85 X-RAY, GAMMA-RAY INSTRUMENTS AND TECHNIQUES

105433 The interference and diffraction of X-rays in dependence of their polarization. P.A.Bezirganyan, A.P.Bezirganyan.

Izv. Akad. Nauk Arm. SSR Fiz. (USSR), vol.17, no.1, p.9-15 (1982). In Russian.

The internal structure of a polarized natural X-ray characteristic wave is considered. With the formation of a phase difference between mutually perpendicular components of the unpolarized radiation there arises an inhomogeneous angular distribution of amplitudes. (6 refs.)

105434 Measurement of subatomic displacements for Mossbauer spectroscopy. E.Ikonen (Dept. of Tech. Phys., Helsinki Univ. of Technol., Espoo, Finland), P.Karp, T.Katila, K.Riski.

J. Phys. E (GB), vol.16, no.9, p.875-8 (Sept. 1983).

A SQUID-based sensor capable of measuring displacements with a resolution of 8 fm/$\sqrt{\text{Hz}}$ in the frequency band from DC to 10 kHz was constructed. Calibration of the sensor was performed with the aid of ^{67}Zn-Mossbauer spectroscopy. The sensor was used to determine the linearity and hysteresis of a piezoelectric PZT-4 transducer at very small displacement amplitudes. The performance of the transducer at a temperature of 4.2K was found adequate for a high-precision Mossbauer velocity drive. (12 refs.)

105435 X-rays from synchrotron: new challenge for neutron scattering. G.Shirane (Brookhaven Nat. Lab., Upton, NY, USA).

Physica B & C (Netherlands), vol.120B+C, no.1-3, p.108-13 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

A brief review is given of current developments in X-ray scattering techniques at synchrotron radiation facilities. Highly collimated, intense source of white radiation open up new areas of research in condensed matter physics and challenge the traditional domains of neutron scattering. These include energy dispersive scattering, the use of anomalous dispersion, magnetic diffraction and direct energy analysis by backscattering. The relative merits of X-ray and neutron scattering techniques are discussed. The unique advantage of neutron scattering is the capability of performing polarization analysis. The author discusses in some detail the current developments at Brookhaven in inelastic scattering of polarized neutrons. In addition, special technical problems associated with the search for phasons utilizing a high-resolution triple axis spectrometer are discussed. (18 refs.)

105436 Gamma photon backscattering in gauging. C.Popescu, M.Oncescu (Central Inst. of Phys., Bucharest, Rumania).

Rev. Roum. Phys. (Rumania), vol.28, no.5, p.439-49 (1983).

A mathematical expression of the probability that a photon, emitted by a point source and backscattered from a material layer, will arrive in a detector placed in a given position is proposed. The radial probability distribution parameter of the exit points of the backscatered photons has been determined by the Monte Carlo method. The dependence of this parameter on the layer thickness has been studied. Six different materials and two photon energies have been investigated. The probability expression can be used in the radiometric design of the gauges based on the photon backscattering; it allows the radiometric assembly optimization and the computation of the radioactive source minimum activity to be used in a given investigation. An application to a density gauge and comparison with the experimental data are presented. (13 refs.)

105437 Design and software of the RED-4 four-circle diffractometer. N.K.Bukhardinov, V.I.Gusev, B.T.Golovchenko, V.V.Dombrovskii, V.I.Koryashkin, A.V.Mirenskii, P.P.Reznikov, D.M.Kheiker (Inst. of Crystallography, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.86-90 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.156-63 (Jan.-Feb. 1983). [received: Sept. 1983]

The authors describe the design and software for a computer-controlled automatic four-circle single-crystal diffractometer. The use of absolute contactless transducers for the angles of rotation, developed specially for this instrument and installed directly on the working shafts, ensures high precision (±0.005°) and reliability of the angular setting of the crystal and detector with no blind zone. Since the beginning of 1981 the diffractometer has been successfully used at the Institute of Crystallography of the Academy of Sciences of the USSR for routine and precision structural investigations. (12 refs.)

105438 A simplified photometric method of measuring granularity spectra for X-ray pictures. M.Wolf, A.M.Gurvich, M.A.Il'ina, R.V.Katomina.

Sov. J. Nondestr. Test. (USA), vol.18, no.10, p.760-4 (Oct. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.10, p.8-14 (Oct. 1982). [received: Sept. 1983]

A simplified photometric method has been devised for measuring the granularity of an X-ray picture, which enables one to determine the granularity factors for intensifying screens and X-ray films, together with the Wiener spectra. The method involves measuring the mean-square fluctuation in the density, the modulation transfer function for the screen, and the gradient of the characteristic curve for a film. These measurements are compared with those made by two other methods (visual and photometric using a computer), and it is found that the proposed method gives satisfactory results. (12 refs.)

105439 X-ray flaw-detection apparatus. P.A.Aleev, E.A.Gusev, B.I.Leonov (Flaw-Detection Res. Inst., Moscow, USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.10, p.770-3 (Oct. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.10, p.21-5 (Oct. 1982). [received: Sept. 1983]
The design features of X-ray sets, which are basic penetrating X-radiating sources for industrial flaw detection, are considered. A classification is given of X-ray equipment, whose applications are discussed along with development prospects. (13 refs.)

11.10 FIELD THEORY

105441 An effective potential for classical Yang-Mills fields as outline for bifurcation on gauge orbit space. F.Nill (Max-Planck-Inst. fur Phys. und Astrophys., Munich, Germany).
Ann. Phys. (USA), vol.149, no.1, p.179-202 (Aug. 1983).
Classical Yang-Mills (YM) equations with static external sources are formulated as a Hamiltonian system with gauge symmetry in $A_0=0$ gauge. Using the concept of a 'momentum mapping' (J. Marsden and A. Weinstein, 1974) on symplectic manifolds with symmetry, an analogue of centrifugal potential of a mass point in a spherically symmetric potential is derived. This gives rise to an effective potential $V_{\rm eff}$, whose critical points are rigorously proved to be in one-to-one correspondence with static YM solutions. $V_{\rm eff}$ additionally depends on the prescribed external source ρ, which is as a constant of motion analogous to angular moment of the mass point. Thus bifurcation of static solutions is caused by bifurcation of critical points of $V_{\rm eff}$ under variation of the external parameter ρ. Some closing remarks on dynamics and stability on gauge orbit space are added. (24 refs.)

105442 Static solutions of the Yang-Mills system coupled to a scalar field. E.Malec (Inst. of Phys., Silesian Univ., Katowice, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.8, p.581-8 (Aug. 1983).
It is proven that the linear Schrodinger (Klein-Gordon) field coupled to Yang-Mills fields has no non-zero static, finite energy, solutions. The case of nonlinear scalar fields is discussed, and necessary criteria for existence of nonzero solutions are given. (7 refs.)

105443 The finite lattice renormalization group and the antiferromagnetic square lattice: a new weight function. N.Jan, L.L.Moseley (Phys. Dept., Univ. of the West Indies, St. Augustin, Trinidad), B.Nienhuis, A.Ramdss-Singh.
Rev. Colomb. Fis. (Colombia), vol.15, no.1, p.83-94 (1981). [received: Aug. 1983]
A generalized weight function is introduced and included within the finite lattice approximation. The rules required for the implementation of this function are given and results are obtained for the ferromagnet and antiferromagnet 2-d square which satisfy the expected symmetry requirements. There is close agreement between the calculated exponents and the exact values. The critical surface obtained in non-zero field agrees quite well with the conjectured surface of Muller-Hartmann and Zittartz. (14 refs.)

105444 Critical dynamics of the sine-Gordon model in $d=2-\epsilon$ dimensions. B.Neudecker (Inst. fur Theoretische Phys., Dusseldorf Univ., Dusseldorf, Germany).
Z. Phys. B (Germany), vol.52, no.2, p.145-9 (1983).
The renormalization scheme of Amit, Goldschmidt and Grinstein (1980) is extended to $d=2-\epsilon$ dimensions. The exponent ν of the correlation length $\nu^{-1}=2\epsilon+O(\epsilon^2)$ is in agreement with the result of Kosterlitz (1977) for the Coulomb gas. The exponent η of the correlation function of the sine-Gordon field is $\eta=\epsilon+O(\epsilon^2)$. The scaling form of the dynamical structure factor $S(q,\omega)$ of the dynamic sine-Gordon Model A is studied in $d=2-\epsilon$ dimensions. (17 refs.)

105445 BPHZ renormalization and surface terms in one loop diagrams. G.McKeon (Dept. of Appl. Maths., Univ. of Western Ontario, London, Ontario, Canada).
Can. J. Phys. (Canada), vol.61, no.9, p.1328-33 (Sept. 1983).
The application of the Bogoliubov-Parasiuk-Hepp-Zimmermann renormalization scheme to one loop diagrams is discussed. A catalogue of useful integrals is presented. Anomalies induced by radiative corrections are examined from this point of view. (21 refs.)

105446 The role of the Froissart-Martin bound in high-energy correlations of scattering quantities. J.Rames (Inst. of Phys., Czechosl. Acad. Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.8, p.870-6 (1983).
It is shown that the form of correlations between the total cross section and the phase of the amplitude is not sensitive to replacing the Froissart bound by a more general one. Physical consequences of this fact are discussed afterwards. (6 refs.)

105447 Local relativistic invariant flows for quantum fields. S.Albeverio (Math. Inst., Ruhr-Univ., Bochum, Germany), P.Blanchard, P.Combe, R.Hoegh-Krohn, M.Sirugue.
Commun. Math. Phys. (Germany), vol.90, no.3, p.329-51 (1983).
For quantum fields with trigonometric interaction in arbitrary space dimension the authors construct a representation of the Lorentz group by automorphisms on a Banach space generated by the Weyl algebra. (48 refs.)

105448 Infrared and ultraviolet dimensional meromorphy of Feynman amplitudes. C.de Calan, A.P.C.Malbouisson (Centre de Physique Theorique, Ecole Polytechnique, Palaiseau, France).
Commun. Math. Phys. (Germany), vol.90, no.3, p.413-16 (1983).
By the concurrent use of dimensional and analytical regularizations with the complete Mellin representation, the authors find in a direct way the ultraviolet and infrared poles in space-time dimension, for any Feynman amplitude with an arbitrary subset of vanishing masses. (5 refs.)

105449 Does a generic connection depend continuously on its curvature?. M.A.Mostow (Dept. of Math., North Carolina State Univ., Raleigh, NC, USA), S.Shnider.
Commun. Math. Phys. (Germany), vol.90, no.3, p.417-32 (1983).
For a principal bundle with semi-simple structure group over a smooth four-dimensional base manifold the set of connections (gauge potentials) A which are uniquely determined by their curvature (field or field strength) F is generic in the set of potentials, endowed with the Whitney topology. However, the operator taking each such field F to its potential A is not continuous. Partial negative results are given concerning the existence of a smaller generic set on which this operator is continuous. (25 refs.)

105450 Ten-dimensional supersymmetric Yang-Mills theory with SO(8)-covariant light-cone superfields. I.Brink (Inst. of Theoretical Phys., Goteborg, Sweden), M.B.Green, J.H.Schwarz.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.125-34 (15 Aug. 1983).
The ten-dimensional supersymmetric Yang-Mills theory is formulated in terms of light-cone superfields that transform as vectors the group of transverse Lorentz transformations (SO(8)). These superfields are constrained by a projection condition, which is solved explicitly. The superfield action is obtained by comparing its component expansion with the usual light-cone gauge component action. (7 refs.)

105451 The axial anomaly and anti-symmetric tensor fields. T.E.Clark, S.T.Love (Dept. Phys., Purdue Univ., West Lafayette, IN, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.135-43 (15 Aug. 1983).
Spin-$^1/_2$ fermions are coupled to external axial vector and rank-2 anti-symmetric tensor fields. The chiral U(1) Ward identity is shown to have anomalous structure given by $F_{\mu\nu}\tilde{F}^{\mu\nu}$ only with $F_{\mu\nu}$ the axial vector field strength tensor. No additional axial anomalies are introduced due to the presence of the anti-symmetric tensor fields. (9 refs.)

105452 A computation of $Tr(-1)^F$ in supersymmetric gauge theories with matter. E.Cohen, C.Gomez (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.183-90 (15 Aug. 1983).
Introduces 'multi-twisted' boundary conditions (MTBC) for gauge theories in a finite volume. MTBC can be applied for a class of gauge theories with non-trivial centers and allow the existence of some matter multiplets which transform non-trivially under the center group. The Witten index for the supersymmetric extension of the gauge theory can be calculated when global

Abelian symmetries exist and turns out to be non-zero and independent of the matter representations. (5 refs.)

105453 On the renormalization of the quantum field theory of point-like monopoles and charges. G.Calucci (Istituto di Fisica Teorica, Univ. di Trieste, Trieste, Italy), R.Jengo.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.501-24 (22 Aug. 1983).
The quantum field theory of point-like monopoles and charges is first formulated on a euclidean lattice for a convenient regularization. The regularization preserves the peculiar features of the theory, namely those related to the invariance and to the quantization condition. The partition function is expressed as a path integral over the particle's closed paths and the action is constructed in terms of arbitrary surfaces having those paths as boundaries. The possible divergences of the continuum limit are discussed, in particular the vacuum polarization ones. It is found that, although both the electric charge Q and the magnetic charge G are renormalized as $Q=Z_QQ_R$ and $G=Z_GG_R$, the quantization condition is preserved by the renormalization i.e. $Z_QZ_G=1$ so that $QG=Q_RG_R=2\pi n$. Due to the dual symmetry of the theory, then, for $Q=-G$ one gets $Z_Q=Z_G=1$. (21 refs.)

105454 Schwinger-Dyson approach to large-*N* gauge theory at finite temperature. A.Gocksch (Dept. of Phys., New York Univ., New York, NY, USA), F.Neri.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.1, p.81-92 (29 Aug. 1983).
The authors show how the Schwinger-Dyson equations can be used to extract useful information about gauge theories at finite temperature and infinite N. They derive equations for both the Wilson loop and the connected part of the correlation of 2 loops. In next-to-leading order the correlation between 2 loops has the temperature dependence of a generalized free field theory. The authors discuss the thermodynamic consequences of the previously obtained result that the Wilson loop is independent of the temperature in the confining phase. (9 refs.)

105455 Study of the lepton-violating (μ^-,e$^+$) reaction in modern gauge theories. G.K.Leontaris, J.D.Vergados (Phys. Dept., Univ. of Ioannina, Ioannina, Greece).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.1, p.137-58 (29 Aug. 1983).
The lepton-violating (μ^-,e$^+$) reaction has been studied in the context of modern gauge theories. Both left-handed and right-left symmetric models have been examined. Special attention has been paid to the following mechanisms: (i) those mediated by massive neutrinos (light or heavy); (ii) those accompanied by massless or light physical Higgs particles (majoron); (iii) those involving more exotic intermediate Higgs particles, e.g. singly charged isosinglets (Zee model) and doubly charged isotriplets; (iv) right-handed currents. The formalism has been applied to the experimentally interesting process $\mu^-+{}^{58}\mathrm{Ni}\rightarrow{}^{58}\mathrm{Fe(gs)}+e^+$. The branching ratio is computed using realistic nuclear wave functions. It is found to be $\lesssim 10^{-27}$ in all models, i.e. too small to be measurable in the foreseeable future. The branching ratio for the (μ^-, e$^+$) reaction to all nuclear states is estimated to be $\lesssim 10^{-20}$, i.e. beyond the goals of planned experiments. (29 refs.)

105456 Ten-dimensional supersymmetric Yang-Mills theory in terms of four-dimensional superfields. N.Marcus, A.Sagnotti, W.Siegel (California Inst. of Technol., Pasadena, CA, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.1, p.159-79 (29 Aug. 1983).
The authors show that the usual formulation of the $N=4$ supersymmetric Yang-Mills theory in terms of $N=1$ superfields can be generalized to describe the full ten-dimensional theory. (21 refs.)

105457 Topological geometrodynamics. M.J.Pitkanen (Lab. of Phys., Helsinki Univ. of Technol., Otaniemi, Finland).
Int. J. Theor. Phys. (USA), vol.22, no.7, p.575-651 (July 1983).
An elementary particle model is proposed drawn from the string model and Yang-Mills theory. Instead of describing a particle as a mathematical point, the author identifies it as three-dimensional submanifold of some metric space H. This generalization leads to a topological classification of particles and their interaction vertices. A topological explanation for the generation degeneracy is proposed. The dynamics of the theory is based on the following assumptions. First, the theory should have the formal structure of the Einstein-Yang-Mills theory defined on a 4-surface describing the 'orbits' of particles. Second, the boundary components of the 3-manifold should carry various elementary particle characteristics. Finally, only the natural geometric structures associated with space H should be used in the construction of the dynamics. The isometry group of CP_2 is $SU(3)$ and is interpreted as a color group. Since color is related to CP_2 translational degrees of freedom and CP_2 has 'radius' of order $G^{1/2}$, the uncertainty principle suggests the mass scale $G^{-1/2}$ for colored states. A unified semiclassical description of hadrons as stringlike objects is proposed and gluons are identified as topologically nontrivial excitations of these objects. Finally, semiclassical considerations suggest that the theory is also capable of describing gravitational phenomena and a topological mechanism generating the classical space-time is proposed. (43 refs.)

105458 Finite quantum field theory and neutrinodynamics. P.Bandyopadhyay (Indian Statistical Inst., Calcutta, India), B.Bhattacharya, H.Sarkar.
Int. J. Theor. Phys. (USA), vol.22, no.8, p.677-89 (Aug. 1983).
In quantum neutrinodynamics (photon-neutrino weak coupling) all the renormalization constants vanish and therefore the field equations cannot be expressed in terms of unrenormalized field quantities. This helps one to formulate quantum neutrinodynamics as a convergent quantum field theory. It is also pointed out that from the viewpoint of the unified model of weak and electromagnetic interaction as developed on the basis of the photon-neutrino weak coupling by Bandyopadhyay, quantum electrodynamics also manifests itself as a convergent field theory. (15 refs.)

105459 On N-soliton solutions of coupled Higgs field equation. M.Tajiri (Dept. of Math. Sci., Univ. of Osaka Prefecture, Osaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2277-80 (July 1983).
N-soliton solutions of the coupled Higgs field equation are obtained by the Hirota bilinear method. The author gives the multi-soliton solutions of the equation.

105460 Structural instability and the massless $\lambda\phi^4$ theory. P.Ghose (British Council, Div. of the British High Commission, Calcutta, India).
J. Phys. A (GB), vol.16, no.13, p.L461-6 (11 Sept. 1983).
It is shown that the massless $\lambda\phi^4$ theory is structurally unstable, and quantum fluctuations cause symmetry breaking and the unfolding of the cusp catastrophe. (5 refs.)

105461 Implications of the non-uniqueness in the solution of the gauge identities for the Schwinger-Dyson equation. B.K.Jennings, R.M.Woloshyn (Triumf, Vancouver, BC, Canada).
J. Phys. G (GB), vol.9, no.9, p.997-1000 (Sept. 1983).
It is shown that the Slavnov-Taylor identity does not put enough constraint on the longitudinal vertex function to allow the unambiguous construction of an approximate Schwinger-Dyson equation for the gluon propagator. (17 refs.)

105462 Are gauge symmetry and phase invariance identical?. J.P.Hsu, T.Y.Shi (Phys. Dept., Southeastern Massachusetts Univ., North Dartmouth, MA, USA).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.14, p.509-12 (6 Aug. 1983).
The authors discuss the difference between Yang-Mills gauge symmetry and phase invariance in a class of gauge group $SL_{\mathrm{N,c}}$. In order to quantize the $SL_{\mathrm{N,c}}$ fields $b_\mu{}^A$, one must insist on the principle of phase invariance rather than the usual gauge symmetry. As a result, the independent components of $b_\mu{}^A$ are reduced by half. The physics of such a theory turns out to be identical with that of the SU_{N} Yang-Mills theory. (8 refs.)

105463 Quantization of the tensor gauge field of second rank in any gauge. C.Di Bartolo (Dept. de Fisica, Univ. Simon Bolivar, Caracas, Venezuela).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.17, p.583-7 (27 Aug. 1983).
The author discusses the quantization of the Abelian free field $\phi_{\alpha\beta}$ in a general gauge family using a quantization procedure recently developed for the electromagnetic theory. This method leads to manifestly covariant reduced Lagrangian and commutation relations. Previous results for the Coulomb gauge and the radiation gauge are reobtained as particular cases. (13 refs.)

105464 A nonlinear two-dimensional sigma-model in relativistic string theory. V.V.Nesterenko (Lab. of Theoretical Phys., JINR, Dubna, USSR).
Lett. Math. Phys. (Netherlands), vol.7, no.4, p.287-93 (July 1983).
It is shown in what way the nonlinear two-dimensional SO(1,2)/SO(1,1)-sigma model appears in the theory of a relativistic string moving in three-dimensional space-time. (12 refs.)

105465 New meron-type solutions. K.G.Akdeniz (Phys. Dept., Trakya Univ., Edirne, Turkey), M.Hortacsu.
Lett. Math. Phys. (Netherlands), vol.7, no.4, p.295-9 (July 1983).
New meron-type solutions are constructed to the Thirring model. (7 refs.)

105466 Geometrical aspects of gauge conditions. J.Lewandowski, J.Tafel, A.Trautman (Inst. of Theoretical Phys., Warsaw Univ., Warsaw, Poland).
Lett. Math. Phys. (Netherlands), vol.7, no.4, p.347-52 (July 1983).
The Lorentz gauge condition is related to harmonic sections of the principal U(1)-bundle underlying a classical electromagnetic configuration. Minimal sections are shown to correspond to a nonlinear modification of the Lorentz condition. Generalizations to Yang-Mills theory are indicated and harmonic coordinates, in the sense of De Donder (1921) and Fock (1959), are related to Hodge's harmonic 1-forms (1952). (17 refs.)

105467 Quasiclassical theory of spin. I.M.Ternov, V.A.Bordovitsyn (Dept. of Quantum Theory, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.84-8 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.72-6 (1982).
The proper-time Dirac equation (τ equation) is used to develop a quasi-classical theory of spin of the Dirac particles. (11 refs.)

105468 The effective potential method for two-dimensional $SU(2)\times SU(2)$ lattice sigma model with the fundamental-adjoint action. K.Nokura (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1753-63 (June 1983).
The effective potential method for the $SU(2)\times SU(2)$ lattice sigma model is extended to the fundamental-adjoint action. It is found that, in the intermediate temperature region, the adjoint action term greatly affects the minimum of the effective potential and leads to a first order phase transition. This is essentially due to the F^4 term of the action, where F is the pitch of the sinusoidal spin configuration. When this term is eliminated by choosing a suitable ratio $G=\beta_A/\beta$, the system goes rather smoothly from the low to the high temperature region. (8 refs.)

105469 Phase diagram of the $SU(2)$ lattice gauge theory with a mixed action. K.Ghoroku (Dept. of Phys., Fukuoka Inst. of Technol., Fukuoka, Japan), Y.Myojyo, H.Nagai.
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1823-6 (June 1983).
The phase structure of the $SU(2)$ lattice gauge theory with a mixed action of $j=1/2$ and 3/2 has been studied by Monte Carlo simulations. A first-order transition line is found and the transition is related to the condensation of the vortex and the monopole of the size of the lattice spacing. (8 refs.)

105470 Fractional charges at finite temperature. S.Midorikawa (Res. Inst. for Fundamental Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1831-4 (June 1983).
Quantum numbers on solitons are studied at finite temperature. It is found that the thermal expectation value of fermion number on kinks or magnetic monopoles vanishes at sufficiently high temperatures. This result can be interpreted as the decoupling of fermions from solitons at very high temperatures. (5 refs.)

105471 Topological charge in lattice gauge theory. P.Woit (Joseph Henry Labs., Princeton Univ., Princeton, NJ, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.638-41 (22 Aug. 1983).
A useful definition of the topological charge of a lattice gauge-field configuration is given. This definition is used to calculate the topological susceptibility $\chi_t=\langle Q^2\rangle/V$ in SU(2) lattice gauge theory by means of a Monte Carlo simulation. $\chi_t=(170\pm 25\ \mathrm{MeV})^4$ is obtained, in good agreement with the current algebra prediction. Other possible uses of this operator are suggested. (13 refs.)

105472 Time delay and the dyon charge. B.Grossman (Rockefeller Univ., New York, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.11, p.959-62 (12 Sept. 1983).
The scattering of fermions from a magnetic monopole is analyzed in a theory with CP nonconservation. The dyon charge that arises can be understood as a Friedel sum rule from the theory of alloys, as the data for a Riemann-Hilbert problem in the theory of integral equations, and as a consequence of specifying Wigner's R matrix at the monopole core. (21 refs.)

105473 Restrictions on left-right symmetric gauge theories from the neutral kaon system and B decays. F.J.Gilman, M.H.Reno (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
Phys. Lett. B (Netherlands), vol.127B, no.6, p.426-8 (11 Aug. 1983).
The authors investigate the constraints imposed on the weak mixing angles by the K^0-$\bar{K}^0$ mass matrix and B meson decay in left-right symmetric gauge theories. In a class of such theories with manifest left-right symmetry the domain of Kobayashi-Maskawa angles allowed by the $K_L{}^0$-$K_S{}^0$ mass difference has no overlap with that allowed by B meson decay. (9 refs.)

105474 Simple doubling of lattice fermions. R.Stacey (Dept. of Appl. Math. & Theoretical Phys., Univ. of Liverpool, Liverpool, England).
Phys. Lett. B (Netherlands), vol.127B, no.6, p.440-2 (11 Aug. 1983).
The author shows how to reduce the number of fermion species on a d-dimensional lattice from 2^d to just 2. Locality and hermiticity are maintained, but there are problems with C, P and T. (6 refs.)

105475 Remarks on quantized Yang-Mills theory in 26 dimensions. R.I.Nepomechie (Dept. of Phys., Brandeis Univ., Waltham, MA, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.177-8 (25 Aug. 1983).
Observes that Yang-Mills theory in 26 dimensions has no infinite coupling constant renormalization at one loop. The author suggests the theory may be solvable in the large-N limit. (12 refs.)

105476 The S-matrix and the effective potential for the Liouville quantum field theory. C.B.Thorn (Phys. Dept., Univ. of Florida, Gainesville, FL, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.207-12 (25 Aug. 1983).
The author argues that the S-matrix for the quantum Liouville field theory is unity. He also discusses the effective potential for the Liouville theory defined on a circle, and shows that the exact result due to Goldstone (1982) is recovered in the large volume limit. (9 refs.)

105477 Analysis of instanton contribution for the periodic CP_1-model. J.L.Richard (Centre de Phys. Theorique, CNRS, Marseille, France).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.213-14 (25 Aug. 1983).
The analysis of the instanton contribution for the CP_1-model with periodic boundary conditions is performed using isospin invariance. An interpretation in terms of a neutral Coulomb gas is given. (7 refs.)

105478 A mass sum rule in softly broken $N=4$ super Yang-Mills theory. S.Rajpoot, J.G.Taylor (Dept. of Math., King's Coll. London, London, England).
Phys. Lett. B (Netherlands), vol.128B, no.5, p.299-302 (1 Sept. 1983).
It is shown that in the $N=4$ super Yang-Mills theory which contains finiteness preserving explicit supersymmetry breaking mass terms for scalars and fermions, the mass spectrum of the particles that results after tree-level spontaneous symmetry breaking satisfies the mass-squared sum rule $\Sigma_{J=0,1/2,1} (-1)^{2J+1} (2J+1)m_J{}^2=0$. (6 refs.)

105479 Operator quantisation of relativistic dynamical systems subject to first class constraints. I.A.Batalin, E.S.Fradkin (Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Phys. Lett. B (Netherlands), vol.128B, no.5, p.303-8 (1 Sept. 1983).
The operator quantisation is carried out of relativistic dynamical systems subjected to first class bosonic and fermionic constraints that generate an open any-rank irreducible gauge algebra. (5 refs.)

105480 On the topological structure of the vacuum in SU(2) and SU(3) lattice gauge theories. K.Ishikawa (City Coll., City Univ. of New York, New York, NY, USA), G.Schierholz, H.Schneider, M.Teper.
Phys. Lett. B (Netherlands), vol.128B, no.5, p.309-15 (1 Sept. 1983).
The authors present Monte Carlo measurements of the net topological charge of the vacuum in SU(2) and SU(3) lattice gauge theories. In both cases there is no evidence of any topological structure, and the values obtained are a factor of O(100) smaller than expectations based on analyses of the U(1) problem. Moreover they find a strong sensitivity to the lattice size and to the boundary conditions imposed on the lattice. They comment on the physical significance of these results, establish criteria for the reliable performance of such calculations, and remark on the possibly detrimental impact of these findings on the calculation of hadron spectra. (24 refs.)

105481 U(∞) lattice gauge theory as a free lattice string theory. V.A.Kazakov (L.D. Landau Inst. for Theoretical Phys., Acad. of Sci., Moscow, USSR).
Phys. Lett. B (Netherlands), vol.128B, no.5, p.316-20 (1 Sept. 1983).
The strong coupling expansion of the U(∞) Wilson lattice gauge theory in any number of dimensions is reformulated in terms of a sum over free lattice surfaces with local internal structure. This is a confirmation of the equivalence of multicolour QCD and some free string theory. The 1/N expansion is shown to be equivalent to the topological expansion in terms of these surfaces. (5 refs.)

105482 Photon mass in a background of thermal particles. J.F.Nieves (Dept. of Phys., Univ. of Puerto Rico, Rio Piedras, Puerto Rico), P.B.Pal, D.G.Unger.
Phys. Rev. D (USA), vol.28, no.4, p.908-14 (15 Aug. 1983).
The mass of the photon in the presence of thermal background particles is studied. The authors present a general proof that all contributions to the photon's thermal mass from low-temperature thermal backgrounds are suppressed by a huge exponential factor at least as large as $e^{m(e)/2kT}$. They explicitly show that there is no contribution to the photon's thermal mass of order $(\alpha G_F)^{1/2}(kT_\nu)^2$ from two-loop diagrams involving thermal neutrinos at temperature T_ν. The largest contribution to the photon's thermal mass from the observed 3K background is also calculated. (16 refs.)

105483 Strong-coupling expansion for off-axis glueball masses in lattice gauge theories. R.Nakayama (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Phys. Rev. D (USA), vol.28, no.4, p.922-35 (15 Aug. 1983).
A method for computing the off-axis glueball masses by a strong-coupling expansion is presented. The calculation is carried out up to order β^4 for Z_2, Z_3, SU(2), and SU(3) theories in four-dimensional space-time. The method may be useful for studying the restoration of Lorentz invariance in the continuum limit of lattice gauge theories. The estimates for glueball masses in SU(2) and SU(3) gauge theories in the continuum limit are obtained by using the 'tangent method'. (14 refs.)

105484 Large-order behavior of lattice strong-coupling expansions. C.M.Bender, L.R.Mead (Dept. of Phys., Washington Univ., St. Louis, MO, USA), L.M.Simmons,Jr..
Phys. Rev. D (USA), vol.28, no.4, p.936-52 (15 Aug. 1983).
The authors examine the lattice strong-coupling expansion for the ground-state energy of the quantum-mechanical Hamiltonian ${}^1/_2p^2+g|x|^\alpha$, $\alpha>0$. They are interested in the large-order behavior of this series for various values of α. Treated as a quantum field theory, this simple model provides a laboratory for investigating the fascinating subtleties that arise when there are cancellations among graphs. The parameter α distinguishes between regions in which these cancellations occur with varying degrees of complexity. This paper considers various approaches to this very difficult problem and presents a partial solution. (9 refs.)

105485 Exact fermion-dyon scattering solutions. W.J.Marciano, I.J.Muzinich (Dept. of Phys., Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. D (USA), vol.28, no.4, p.973-6 (15 Aug. 1983).
The authors analyze the Dirac equation for an $I={}^1/_2$ fermion in the field of an SU(2) Julia-Zee dyon. In the Prasad-Sommerfield limit they obtain exact $J=0$ partial-wave solutions for massless fermions. These solutions describe charge-exchange scattering as well as dyon decay via charged-fermion-pair emission. When the initial fermion-dyon Coulomb interaction is repulsive, low-momentum single-particle $J=0$ scattering is prohibited. Implications of the results for proton decay catalysis by SU(5) dyons are briefly discussed. (17 refs.)

105486 Fermion-monopole system reexamined. II. H.Yamagishi (Joseph Henry Lab. of Phys., Princeton Univ., Princeton, NJ, USA).
Phys. Rev. D (USA), vol.28, no.4, p.977-88 (15 Aug. 1983).
For pt.I see ibid., vol.27, p.2383 (1983). Following a preceding paper, the author reexamines the interaction of magnetic monopoles (dyons) with Dirac particles. For an infinitely heavy SU(2) dyon with one isodoublet fermion, it is shown that the vacuum angle in the original theory may be incorporated as a boundary condition in an effective one-particle Hamiltonian, which allows one to determine the charge distribution and the fermionic structure of the stable dyons. The resulting boundary conditions turn out to be Abelian and charge conserving, in contrast to that of previous authors. In particular, the dyon degree of freedom is essentially frozen, and there is no charge-exchange scattering off the dyon. With a Dirac mass term for the fermion, the author also finds that the ground state is twofold degenerate, owing to a spontaneous breakdown of fermion-number conjugation. For a Higgs mass, it is found that the conjugation symmetry is unbroken, as in the original analyis of Jackiw and Rebbi. However, because of the changed boundary condition, the characteristic zero mode ceases to exist, and the ground state is nondegenerate with zero fermion number. (45 refs.)

105487 Instanton chains with multimonopole limits: Lax pairs for non-axially-symmetric cases. A.Chakrabarti (Centre de Phys. Theorique, Ecole Polytech., Palaiseau, France).
Phys. Rev. D (USA), vol.28, no.4, p.989-1000 (15 Aug. 1983).
A formalism is proposed for constructing sequences of instantons which give, in a simple scaling limit, separable multimonopole solutions. For this purpose essentially static techniques are adapted to the construction of finite-action solutions through a trick already used before for the axially symmetric case. For going beyond axial symmetry appropriate Lax pairs are constructed. Then, in the framework of Zakharov et al. for purely solitonic solutions, pole equations are solved and a suitable seed solution $\psi_{(0)}$ obtained. The restriction to axial symmetry in this framework is presented. The corresponding results in the monopole limit are shown to emerge trivially from those for instantons. (23 refs.)

105488 Stochastic quantization and the large-N reduction of U(N) gauge theory. J.Alfaro (Phys. Dept., City Coll., City Univ. of New York, New York, NY, USA).
Phys. Rev. D (USA), vol.28, no.4, p.1001-9 (15 Aug. 1983).
The large-N reduction of U(N) gauge theory is studied using the stochastic quantization method of Parisi and Wu. The main result is that within this context the author obtains the reduction of the gauge theory without introducing extra constraints among the dynamical variables. (16 refs.)

105489 Analysis of anomalies in higher space-time dimensions. P.H.Frampton, T.W.Kephart (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA).
Phys. Rev. D (USA), vol.28, no.4, p.1010-23 (15 Aug. 1983).
The anomaly for a dimension $D=2n$ gauge theory is calculated for arbitrary $n\geq2$ from the l-agon Feynman diagram with $l=(n+1)$. The result is both finite and unique despite the nonrenormalizability of the theory. The contributions of higher polygons to the anomaly are deduced from gauge invariance and Lorentz invariance. The no-anomaly condition in $D=2n$ is the vanishing of a symmetrized trace over l generators written in the fermion representation. It is shown how to compute this trace for totally antisymmetric representations of SU(N). (15 refs.)

105490 Effective Hamiltonians in the large-N limit. O.A.Karim (Dept. of Phys., Brown Univ., Providence, RI, USA).
Phys. Rev. D (USA), vol.28, no.4, p.1036-8 (15 Aug. 1983).
Lattice gauge theories are considered in the large-N limit. Two different approaches for obtaining an effective Hamiltonian are studied and compared. The gauge-volume approach is shown to differ from the collective-field one, and therefore the two may not yield the same large-N limit. It is argued that the collective formalism is the correct one. (10 refs.)

105491 Comment on derivation of anomalous Ward-Takahashi identities in the functional integration formulation of field theory. D.W.McKay (Dept. of Phys. & Astron., Univ. of Kansas, Lawrence, KS, USA), B.-L.Young.
Phys. Rev. D (USA), vol.28, no.4, p.1039-41 (15 Aug. 1983).
The authors point out that in the calculations of the triangle anomaly there is a discrepancy between the result of the functional method applied to a chiral model by Fujikawa (1980) and the result of the conventional perturbation approach applied to this model. Possible sources for the discrepancy are briefly discussed. (21 refs.)

105492 An investigation of the infrared behaviour of the gluon propagator in the axial gauge. P.Haase Sorensen (Inst. of Phys., Univ. of Arhus, Arhus, Denmark).
Phys. Scr. (Sweden), vol.28, no.2, p.201-4 (Aug. 1983).
In the axial gauge an integral equation for the gluon propagator of a pure Yang-Mills theory is derived on the Dyson-Schwinger equation and the Slavnov-Taylor identities. Dimensional regularization is used. The solution of this equation is investigated in the case where the variable $\lambda=(n,k)^2/n^2k^2$ is different from zero and it is seen that the nice properties of the confining solution $D(k)\sim1/k^4$ are lost in this case. (10 refs.)

105493 Soliton-like solutions of some nonlinear theories and transformations among them. G.P.Malik, J.Subba Rao (School of Environmental Sci., Jawaharlal Nehru Univ., New Delhi, India), G.Johri.
Pramana (India), vol.20, no.5, p.429-38 (May 1983).
The observation that the soliton-like solutions of a given second-order differential equation define the separatrix of the equivalent autonomous system is used to obtain the one-soliton solutions for the ϕ^4 theories (the usual and the one with the wrong sign of the mass term), the ϕ^6, the ϕ^8, the sine-Gordon theories and the KdV equation. Transformations are given which transform the sine-Gordon equations into an equation belonging to the ϕ^{2n} class of theories. A procedure is evolved for obtaining the two-soliton solutions for the sine-Gordon theory without the use of Backlund transformations; it is suggested that this procedure may be useful for investigating the existence of similar solutions for theories of the polynomial type. 105494 Chirality index and dimensional reduction of fermions. C.Wetterich (CERN, Geneva, Switzerland).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.109-24 (15 Aug. 1983).
The number of four-dimensional chiral fermions obtained from dimensional reduction of models with spinor matter fields coupled to pure gravity in $d>4$ dimensions is linked to topological properties of the internal d-4 dimensional space. This gives important restrictions on possible ground states of such models consistent with a realistic four-dimensional unified theory. Connections with spontaneous symmetry breaking and Yukawa couplings of fermions in unified theories are discussed. (16 refs.)

105495 Dynamical stability of the BRS supersymmetry and the Gribov problem. K.Fujikawa (Inst. for Nuclear Study, Univ. of Tokyo, Tanashi, Tokyo, Japan).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.218-34 (15 Aug. 1983).
The stability of the Becchi-Rouet-Stora supersymmetry is studied on the basis of a simple non-gauge model invariant under BRS supersymmetry. The Nambu-Goldstone theorem is stated and the spontaneous breakdown of the BRS supersymmetry is illustrated by the above non-gauge model. this indicates that the dynamical stability of BRS supersymmetry in non-Abelian gauge theories should also be carefully examined, if one takes the Faddeev-Popov lagrangian as a basis of the formal canonical treatment. The author shows that a better understanding of the Gribov problem is required to establish the stability of the BRS supersymmetry in non-Abelian gauge theories to non-perturbative accuracy. (25 refs.)

105496 Instantons in supersymmetric theories. V.A.Novikov, M.A.Shifman, A.I.Vainshtein, V.I.Zakharov (Inst. of Theoretical & Experimental Phys., Moscow, USSR).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.445-73 (22 Aug. 1983).
Instanton effects are considered for a sample of supersymmetric theories, namely, quantum mechanics, gluodynamics, Higgs model. The problem is how to reconcile the apparent lack of the boson-fermion symmetry in the effective instanton induced interactions with supersymmetry of the corresponding Lagrangians. It is shown that in the case of quantum mechanics and the Higgs model there is actually no conflict between supersymmetry and the instanton calculus since the Ward identities associated with the supersymmetry transformations, are satisfied. In quantum mechanics this is due to spontaneous symmetry breaking, or pole terms in matrix elements of supercharge, while in the case of the supersymmetric Higgs model the effective fermion interaction just reduces to a total derivative. In the case of supersymmetric gluodynamics, however, the standard instanton calculus explicitly violates naive Ward identities. (13 refs.)

105497 Spontaneous lepton-number violation and de-leptonization in stellar collapse. D.A.Dicus (Center for Particle Theory, Univ. of Texas, Austin, TX, USA), E.W.Kolb, D.L.Tubbs.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.532-41 (22 Aug. 1983).
The authors consider core collapse in weak interaction models where global lepton-number invariance is spontaneously broken. They find that the initial neutrino number prevents finite temperature restoration of lepton-number conservation. Assuming the lepton-number violating reactions occur rapidly, they show that the neutrino number is driven to a sufficiently small value to allow electron capture reactions to de-leptonize the core, and lead to a high-entropy collapse. (11 refs.)

105498 $\Delta B=2$ transitions. J.Basecq, L.Wolfenstein (Carnegie-Mellon Univ., Pittsburgh, PA, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.1, p.21-31 (29 Aug. 1983).
It is pointed out that, for certain $\Delta B=2$ operators, transitions of the form $N+N \rightarrow$ mesons occurring in complex nuclei provide a much more sensitive probe than do neutron-antineutron oscillations in a vacuum. (15 refs.)

105499 Renormalization of the electroweak ρ-parameter from supersymmetric particles. R.Barbieri (Dipartimento di Fisica, Univ. di Pisa, Pisa, Italy), L.Maiani.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.1, p.32-42 (29 Aug. 1983).
The authors compute the renormalization of the neutral-to-charged current Fermi constant ratio, arising from the new particles required in supersymmetric schemes. They find that ρ is insensitive to the scale of the supersymmetry mass-splitting. For a t-quark mass m_t greater than this scale, the scaler-t and scalar-b contribution increases proportionally to m_t^2 and it is essentially equal, in sign and magnitude, to the t-, b-quark contribution. Contributions from the gaugino-higgsino-Higgs boson sector are generally of the order of a few parts in 10^{-3}. For a class of models under consideration these results can be traced back to an approximate SU(2) symmetry which is also useful in the classification of the new particle spectrum. (13 refs.)

105500 Quantum versus gravitational effects in supersymmetric theories. M.Dine (Inst. for Advanced Study, Princeton, NJ, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.1, p.93-106 (29 Aug. 1983).
The author considers what happens when certain globally supersymmetric grand unified models are coupled to $N=1$ supergravity. Treating only leading (i.e. tree level) gravitational effects while treating non-gravitational effects to all orders, the author shows how the original globally supersymmetric theory is recovered as $M_p \rightarrow \infty$. This allows one to compare the importance of various gravitational and non-gravitational effects. A potentially realistic model is presented and analyzed. Possible quantum gravitational effects are mentioned. (22 refs.)

105501 Similarity reduction of modified Kadomtsev-Petviashvili equation. M.Tajiri (Dept. of Math. Sci., Univ. of Osaka Prefecture, Osaka, Japan), S.Kawamoto.
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2315-19 (July 1983).
Similarity solutions of the modified Kadomtsev-Petviashvili equation are investigated by using infinitesimal transformations of Lie's method. It is shown that the modified Kadomtsev-Petviashvili equation can be transformed, by the first reduction, to modified Boussinesq-type, the modified K-dV equations and others. (16 refs.)

105502 The dynamical symmetries of the monopole in geometric quantization. P.A.Horvathy (Faculty fur Phys., Univ. Bielefeld, Bielefeld, Germany).
Lett. Math. Phys. (Netherlands), vol.7, no.4, p.353-61 (July 1983).
The 'hidden' $o(3) \times o(2,1)$ symmetry of the magnetic monopole discovered recently by Jackiw (1980) is studied in the geometric framework of Kostant (1970) and Souriau (1970). (21 refs.)

105503 Covariance of spontaneous symmetry breaking in non-inertial frames. B.Bagchi (Dept. of Phys., Presidency Coll., Calcutta, India).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.143-4 (22 Aug. 1983).
It is pointed out that contrary to a recent claim the process of symmetry breaking is covariant in a non-inertial frame. (2 refs.)

105504 Catalysis of flavor nonconservation by monopoles. V.P.Nair (Phys. Dept., Syracuse Univ., Syracuse, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.631-3 (22 Aug. 1983).
A simple argument based on current algebra is given to show how monopoles can lead to baryon decay and other flavor-changing processes. (9 refs.)

105505 Long-range behavior of nuclear forces as a manifestation of supersymmetry in nature. L.F.Urrutia, E.Hernandez (Centro de Estudios Nucleares, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Phys. Rev. Lett. (USA), vol.51, no.9, p.755-8 (29 Aug. 1983).
It is shown that each isospin channel in the long-range approximation to the nucleon-nucleon potential (one-pion-exchange potential) corresponds to a realization of a quantum mechanical supersymmetric Hamiltonian. A functional relation between the coordinate-dependent coefficients of the spin-spin and tensor parts of the interaction predicted by supersymmetry is exactly fulfilled. (11 refs.)

105506 Possible scalar-quark production of the proton-antiproton collider. M.Gluck, E.Reya (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany).
Phys. Rev. Lett. (USA), vol.51, no.10, p.867-8 (5 Sept. 1983).
Single-jet events opposite to an electron track at the proton-antiproton collider may signal the semileptonic decay $\tilde{q} \rightarrow e\tilde{\nu}X$ of a heavy scalar quark $\tilde{q}$ with $m_q=35$ GeV. Only an observation of the opposite anti-scalar-quark or gluino jet with its typical missing-energy pattern can distinguish this possibility from the recently suggested top-quark interpretation of the 'electron plus single-jet' events. The nonobservation of the hadronic opposite-side jet, for the

experimental cut $E_T^{jet}>10$ GeV, favors a missing-energy signature as expected for supersymmetric particles. (12 refs.)

105507 Proton instability and the $SU_5 \otimes U_1$ subgroup of SO_{10}. W.Alles (Inst. di Fisica, Univ. di Bologna, Bologna, Italy).
Phys. Lett. B (Netherlands), vol.127B, no.6, p.423-5 (11 Aug. 1983).
It is shown, for the case of three generations of fermions, that for gauge interaction of the $SU_5 \otimes U_1$ subgroup of SO_{10} the nucleon can be made stable to zeroth order in the weak interactions with no restriction on the Kobayashi-Masakawa mixing matrix. (10 refs.)

105508 Gluino and photino masses in a class of locally supersymmetric models. R.Bsarbieri (Istituto di Fisica, Univ. di Pisa, Pisa, Italy), L.Girardello, A.Masiero.
Phys. Lett. B (Netherlands), vol.127B, no.6, p.429-32 (11 Aug. 1983).
The authors analyze all possible sources of radiative gaugino masses in a class of SU(3)⊗U(2)⊗U(1) locally supersymmetric models. Barring direct gaugino masses and radiative contributions from superheavy particles of grand unified theories, they find that: (i) consistently with the present bounds, gluinos with a mass of 1-1.5 GeV and relatively long lived ($c_\tau \approx 1$ cm) can be obtained from a virtual heavy top exchange (150 GeV$\lesssim m_t \lesssim$200 GeV); (ii) the photino masses are in the 100 meV range; (iii) no sizable gravitational radiative effect exists at one loop. (14 refs.)

105509 Supersymmetry and parastatistics. R.Y.Levine, Y.Tomozawa (Dept. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.189-93 (25 Aug. 1983).
An analysis is made of the supersymmetry of parafields in Wess-Zumino-type models with two cases in which parabosons and parafermions form a supermultiplet. In case one the symmetry is realized by either the normal superalgebra or an infinite Lie algebra as in ordinary supersymmetry. In case two the infinite Lie algebra is intrinsic to the supersymmetry. With appropriate symmetry breaking, formulations of these types may be used to explain the generation problem by postulating unobserved parabosons as supersymmetric partners. The relevance to these models of an infinite Lie algebra constructed from supersymmetry is mentioned. (9 refs.)

105510 Super-b_4 coefficients. I.N.McArthur (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.194-8 (25 Aug. 1983).
For a class of supersymmetric theories coupled to background Yang-Mills superfields and on a curved superspace background, the superfield analogue of the heat kernel is defined and the corresponding b_4 superfields are computed. In specific cases, these super-b_4 coefficients are shown to determine the one loop trace supermultiplet and the logarithmically divergent part of the effective action. (14 refs.)

105511 A supersymmetric variant of Dashen's formula. G.Veneziano (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.199-202 (25 Aug. 1983).
In SUSY-QCD Dashen's formula (1969,71) is shown to be accompanied, in a SUSY vacuum, by a more useful relation giving the behaviour of $F_{\pi i}{}^{a} M_{ij} F_{\pi j}{}^{b}$ in the chiral limit. As a consequence, the previously noted properties of SUSY vacua at small mass become even more puzzling. (15 refs.)

105512 The charged current couplings and *CP*-violation in the B-meson system. E.A.Paschos, B.Stech (CERN, Geneva, Switzerland), U.Turke.
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.240-4 (25 Aug. 1983).
Considers a lifetime range for the B meson from the observed upper limit down to 0.3×10^{-12} s. Under this constraint all elements of the flavour mixing matrix are strongly restricted. By fitting the ϵ parameter in K^0-decay a relatively large *CP*-violating phase angle is required. (13 refs.)

105513 Massive superspace—a superspace with massive scalars and gauginos. K.T.Mahanthappa, G.M.Staebler (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.43-6 (15 Sept. 1983).
The authors introduce a superspace whose global metric is modified in the fermionic sector and hence does not have the canonical supersymmetry. This introduces masses for physical scalar particles and gauginos with their superpartners remaining massless. Cancellation of quadratic divergences among fermion and boson loops is exhibited at one-loop level. (12 refs.)

105514 Supersymmetric gauge fixing and the effective potential. R.D.C.Miller (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.72-6 (15 Sept. 1983).
Supersymmetric (SUSY) covariant gauge fixing is analyzed at a component field level using the methods of Fukuda and Kugo (1976). The author finds that for all models with *D* type breaking and almost all models with *F* type breaking supersymmetric covariant gauge fixing is a 'bad gauge' choice (characterized by the unwelcome situation where the gauge multiplet picks up an *x* dependent VEV). SUSY $R\xi$ gauges avoid this problem. (5 refs.)

105515 Low energy *CP* violation in broken supersymmetry. F.del Aguila, J.A.Grifols, A.Mendez (Dept. de Fisica Teorica, Univ. Autonoma de Barcelona, Barcelona, Spain), D.V.Nanopoulos, M.Srednicki.
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.77-9 (15 Sept. 1983).
The authors investigate the *CP* violation effects in supersymmetry broken models, due to the exchange of new fermions (gauginos and higgsinos). When the real part of the K^0-$\bar{K}^0$ amplitude is compatible with the experimental value, the possible imaginary part is too small to account for the ϵ parameter. In contrast, the experimental bounds on the ϵ' parameter and the electric dipole moments and especially the θ parameter, impose in general severe constraints on the possible *CP* violating phases. However, in some specific models there are extra suppression factors, leaving those phases essentially unconstrained except perhaps for the θ parameter. (14 refs.)

105516 Bounds on masses of Higgs boson and heavy fermions in a softly broken supersymmetric model. K.Tabata, I.Umemura, K.Yamamoto (Dept. of Nuclear Engng., Kyoto Univ., Kyoto, Japan).
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.80-4 (15 Sept. 1983).
The authors discuss in an $SU(3)_C \times SU(2)_W \times U(1)_Y$ gauge model with softly broken supersymmetry, the upper bounds on masses of the Higgs particle (m_H) and the quark of the fourth generation (m_U), and also the lower bound on Higgs mass. Requiring that no interaction should become strong until the grand unification energy is reached, they obtain the upper bounds $m_H<220$ GeV and $m_U<150$ GeV. The lower bound on the Higgs mass is studied in detail for the case that the gaugino masses (Δm) break supersymmetry softly. The vacuum is stable for any value of Δm if $m_H \gtrsim 12$ GeV. (9 refs.)

105517 Supersymmetric S-covariant R_ξ gauge. P.Binetruy, P.Sorba, R.Stora (LAPP, Annecy-le-Vieux, France).
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.85-9 (15 Sept. 1983).
The authors present a supersymmetric extension of a class of nonlinear gauges which respect the residual gauge invariance of spontaneously broken gauge theories. (10 refs.)

105518 Comment on the Peccei-Quinn symmetry. D.Wyler (ETH-Honggerberg, Zurich, Switzerland).
Phys. Rev. D (USA), vol.28, no.4, p.1024-7 (15 Aug. 1983).
It is shown that the U(1) symmetry of Pecci and Quinn leads to vanishing strong *CP* violation even if chiral symmetry is spontaneously broken by the strong interactions. (12 refs.)

11.40 CURRENTS AND THEIR PROPERTIES

105519 Global aspects of current algebra. E.Witten (Joseph Henry Lab., Princeton Univ., Princeton, NJ, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.422-32 (22 Aug. 1983).
A new mathematical framework for the Wess-Zumino chiral effective action is described. It is shown that this action obeys an a priori quantization law analogous to Dirac's quantization of magnetic change. It incorporates in current algebra both perturbative and non-perturbative anomalies. (10 refs.)

105520 Current algebra, baryons, and quark confinement. E.Witten (Joseph Henry Labs., Princeton Univ., Princeton, NJ, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.433-44 (22 Aug. 1983).
It is shown that ordinary baryons can be understood as solitons in current algebra effective Lagrangians. The formation of color flux tubes can also be seen in current algebra, under certain conditions. (12 refs.)

11.80 RELATIVISTIC SCATTERING THEORY

(see also 03.80 General theory of scattering)

105522 Lorentz invariance in relativistic potential theory. D.R.Giebink (Dept. of Phys., Texas A&M Univ., College Station, TX, USA).
Phys. Rev. C (USA), vol.28, no.2, p.818-22 (Aug. 1983).
An overview of the Lorentz-transformation properties of the potential and the off-energy-shell *T* matrix in relativistic potential theory is presented from a coordinate-space viewpoint. A formulation of relativistic potential theory that employs an energy-dependent potential in reference frames other than the center of mass is developed. It is shown that the potential and off-energy-shell *T* matrix in this formulation have simple Lorentz-transformation properties. (6 refs.)

Improved high-energy bound on the logarithmic derivative of scattering amplitudes .... See Entry 105606

12.00 SPECIFIC THEORIES AND INTERACTION MODELS; PARTICLE SYSTEMATICS

12.10 UNIFIED FIELD THEORIES AND MODELS

105523 Supersymmetric grand unified theory with soft breaking of intermediate mass scale. H.Nishino (Internat. Centre for Theoretical Phys., Trieste, Italy), S.Watamura.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.235-51 (15 Aug. 1983).
Considers a supersymmetric GUT with the soft breaking of supersymmetry at an intermediate mass scale. A realistic and natural unified model is constructed. (31 refs.)

105524 On the possibility of finding light uncolored supersymmetric partners at present and future machines. J.-M.Frere, G.L.Kane (Randall Lab. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.331-50 (22 Aug. 1983).
Supersymmetric models allow the possibility of finding new light spin-$^1/_2$ fermions ($m<m_W$, and perhaps $m<$10-15 GeV, charged or neutral) that are (apart from mixing effects) the supersymmetric partners of W, Z^0, and Higgs bosons. The authors provide a detailed analysis of their expected properties, production mechanisms, and signatures, with emphasis on detection at e^+e^- colliders. Although the charged, spin-$^1/_2$ particles resemble sequential leptons, it turns out that their properties differ enough that they might have been missed in the standard searches with normal cuts, and they still might be found with $m<18$ GeV. A neutral, spin-$^1/_2$ particle with m below about 30 GeV could exist with a clear decay signature and be singly produced at detectable rates at present machines (picobarn cross sections). (13 refs.)

105525 Supersymmetry-breaking through *D*-terms. M.Dine (Inst. for Advanced Study, Princeton, NJ, USA), D.Nemeschansky.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.351-65 (22 Aug. 1983).
Models in which supersymmetry is broken by the Fayet-Iliopoulos mechanism are reconsidered. The possibility that scalar quark and lepton masses might arise radiatively in such theories is explored. It is shown that in several interesting cases, these masses-squared are all negative. In grand-unified versions of these models, it is shown that the scale of SU(2)×U(1) breaking tends to be much larger than the scalar quark and lepton masses, i.e. that the hierarchy is unstable. (16 refs.)

105526 Higher-order effects and the vector boson physical parameters. M.Consoli, S.L.Presti (Istituto di Fisica, Univ. di Catania, Catania, Italy), L.Maiani.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.474-500 (22 Aug. 1983).
A detailed analysis of the higher-order effects of the vector boson masses and leptonic decay rates is presented. Previous results obtained by different authors are discussed and compared within a simple renormalization scheme. The experimental precision required for a meaningful test of the theory at the one-loop level is also discussed. (22 refs.)

105527 The possibility of new fermions with $\Delta I=0$ mass. F.Del Aguila (Phys. Dept., Univ. of Florida, Gainesville, FL, USA), M.J.Bowick.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.1, p.107-36 (29 Aug. 1983).
In the Glashow-Weinberg-Salam model the fermions have $\Delta I={}^1/_2$ masses from the breaking of the weak SU(2) gauge symmetry. In many enlarged models, such as those from grand unified and/or supersymmetric theories, there are additional fermions with undetermined $\Delta I=0$ (SU(2) invariant) masses. The authors study these new fermions. They induce flavour changing neutral currents. They show that the mixing angles of $\Delta I=0$ fermions of mass order M with normal $\Delta I={}^1/_2$ fermions of mass order $m \ll M$ are order η or η^2, where $\eta=m/M$. If $M>150\ \delta$, δ being a model-dependent mixing parameter of order a normal fermion mass, the amplitudes of all FCNC processes are below the experimental sizes and limits. Thus for $\delta \lesssim 0.1$ GeV, M can be as low as 20 GeV, close to the present experimental lower bound. δ is fixed, and less than 0.1 GeV for all relevant cases, if one assumes the mass hierarchy of the known fermions is not the result of a particular choice of $\Delta I=0$ mass parameters. If produced, $\Delta I=0$ mass fermions will be noticeable by the mass degeneracy within their isospin multiplets. There will be an enhanced ratio of neutral to charged decays over the normal fermions. Standard GUT predictions are changed little. (29 refs.)

105528 Neutrino oscillations in grand unified models with a horizontal symmetry. Z.G.Berezhiani, D.L.Chkareuli (Inst. of Phys., Acad. of Sci., Georgian SSR).
JETP Lett. (USA), vol.37, no.6, p.338-41 (20 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.6, p.285-8 (20 March 1983). [received: Sept. 1983]
A new mechanism for the generation of neutrino masses is discussed in the SU(5) grand unified model with a horizontal symmetry $SU(3)_H$ between quark-lepton generations. A strong ν_μ-ν_τ mixing is predicted in a model with tree quark generations. The primary oscillation effects in the six-generation model involve the mixing of only left-hand and right-hand neutrinos. (7 refs.)

105529 Polarization effects in the process of bremsstrahlung creation of massive mesons in a magnetic field. I.M.Ternov, V.N.Rodionov, V.G.Zhulego, A.I.Studenikin (Dept. of Quantum Theory, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.60-4 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.53-7 (1982).
The authors obtain the probabilities of bremsstrahlung creation of the massive vector Weinberg-Salam meson in a magnetic field. They study the dependence of the total probability of the axial component of the transition current, and on the spin orientation of the initial electron. It is shown that the sign of the spin correction can change with the relative magnitude of the axial component of the current. (6 refs.)

105530 Absence of Goldstino decoupling in hierarchical superunified models. M.B.Einhorn, D.R.T.Jones (Randall Lab. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.174-6 (25 Aug. 1983).
It is shown that there exists a class of hierarchical supersymmetric unified models in which the Goldstino field does not decouple from the light states. The authors illustrate this with an SU_N model. The phenomenology and cosmology of such models is discussed. (11 refs.)

105531 ***B-L* violation in supersymmetric SU(5).** M.J.Bowick, M.K.Chase, P.Ramond (Phys. Dept., Univ. of Florida, Gainesville, FL, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.185-8 (25 Aug. 1983).
The authors examine the consequences of the *B-L* violating terms that occur in the most general superpotential of globally supersymmetric SU(5) grand unified models. They find that some of the coefficients in the *B-L* violating sector of the theory must be very small in order to satisfy the experimental bounds on neutrino masses and proton decay. Various symmetries which forbid or suppress the *B-L* violating terms are discussed. (12 refs.)

105532 An SU(5) axion model with Georgi-Jarlskog mass matrices but without domain walls. M.J.Hayashi (Dept. of Phys., Tokai Univ., Numazu, Japan), A.Murayama.
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.47-50 (15 Sept. 1983).
An SU(5) axion model is presented which reproduces the Georgi-Jarlskog mass matrices but gives no cosmological domain walls. The assumption that $U(1)_{B-L}$ and $U(1)_{PQ}$ are spontaneously broken simultaneously at a mass scale of 10^7-10^{12} GeV leads to $m_{\nu_\tau}=10$ eV-100 KeV. The close relation between the anomalous $U(1)_{PQ}$ and the generation structure of quarks and leptons is emphasized. (17 refs.)

105533 Supersymmetric grand unification and neutron-antineutron oscillations. S.Kalara (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA), R.N.Mohapatra.
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.57-60 (15 Sept. 1983).
The authors present an extension of the minimal supersymmetric SU(5) model which gives rise to an observable rate for neutron-antineutron oscillation without any special fine tuning of parameters. The dominant Feynman graph involves the exchange of Higgs fermions and a light right-handed Majorana neutrino with radiatively induced mass of ~10 GeV. Other phenomenological implications of the model are studied. (16 refs.)

105534 Patterns of local supersymmetry breaking in SUSY GUTS. J.Leon, M.Quiros (Inst. de Estructura de la Materia, Madrid, Spain), M.Ramon Medrano.
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.61-6 (15 Sept. 1983).
The super-Higgs effect is analyzed in the framework of SUSY GUTS. The authors consider the cases where: (i) local SUSY is broken through a gauge singlet field, and (ii) local SUSY and the grand unification group are simultaneously broken when a non singlet field takes a non zero VEV. The second case is illustrated with the SU_5 SUSY GUT where the adjoint plays the role of the super-Higgs fields. (18 refs.)

105535 Local SUSY breaking induced by the GUT phase transition in the early Universe. C.Kounnas (CERN, Geneva, Switzerland), J.Leon, M.Quiros.
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.67-71 (15 Sept. 1983).
The authors show that the confining properties of the grand unification theory (GUT) may induce a transition to a ground state where both local SUSY and gauge symmetry are broken. The super-Higgs field belongs to the adjoint representation which breaks gauge symmetry taking a VEV of the order of the grand unification scale M_x. A suitable class of superpotentials is proposed. They show that the critical temperature of the phase transition is 10^{10} GeV. They get an approximate relation between M_x and the gravitino mass. (24 refs.)

105536 Lepton-number violation with quasi-Dirac neutrinos. J.W.F.Valle (Theory Div., Rutherford Appleton Lab., Chilton, Didcot, England), M.Singer.
Phys. Rev. D (USA), vol.28, no.3, p.540-5 (1 Aug. 1983).
The authors investigate lepton-number violation in weak interactions with massive Dirac neutrinos. In the framework of a simple $SU(3)_L \times U(1)$ electroweak model they find that neutrinos naturally acquire only Dirac masses at tree level, and for an odd number of lepton families, one neutrino remains massless. After a spontaneous breakdown of symmetry they find that the SU(2)×U(1) effective theory has lepton-number-violating currents which couple to the standard gauge bosons. Flavor-conserving $|\Delta l|=2$ processes such as neutrinoless double-β decay are forbidden in the simplest model, but processes such as $\mu^-+(A,Z)\to e^++(A,Z-2)$ and $K^-\to\pi^+e^-\mu^-$ are allowed. (20 refs.)

105537 Strangeness-changing processes and the limit on the right-handed gauge-boson mass. R.N.Mohapatra (Phys. Dept., City Coll. of New York, New York, NY, USA), G.Senjanovic, M.D.Tran.
Phys. Rev. D (USA), vol.28, no.3, p.546-57 (1 Aug. 1983).
The authors study strangeness-changing processes, in particular, the K_L-K_S mass difference and $K\to 2\pi$ decays, in the context of left-right-symmetric gauge theories in a search for a lower bound on a scale of parity-breaking M_R. They find that the previously claimed limit on M_R is a function of Higgs-boson masses and also the top-quark mass and its mixings to lighter quarks. For the light *t* quark ($M_t \leq 30$ GeV), we get $M_R > 200$ GeV (for $m_H \simeq 100$ GeV), and the bound goes down with the increasing *t*-quark mass. Even in the case of a very heavy neutral Higgs boson ($m_H \simeq 1$ TeV), the lower limit on M_R is only ~400 GeV. They argue that the best limits on M_R must come from neutral-current phenomena. (30 refs.)

105538 Dynamical generation of fermion mass differences within grand unified theories with a reduced mass-scale range of static symmetry. V.Elias (Dept. of Appl. Maths., Univ. of Western Ontario, London, Ontario, Canada), S.Rajpoot.
Phys. Rev. D (USA), vol.28, no.3, p.580-7 (1 Aug. 1983).
The authors examine coupling-constant evolution and the proposed dynamical generation of fermion mass differences within $[SU(5)]^3$ and $[SO(10)]^3$ unification symmetry, and they show that sensible fundamental-fermion mass ratios cannot devolve perturbatively within such models. They also demonstrate how weak-angle constraints equilibrate intermediate symmetry-breaking mass scales below the grand unified mass scale within such models. (20 refs.)

105539 Environmental effects on possible *n*-*n̄* transitions. G.Costa (Istituto di Fisica Galileo Galilei, Univ. di Padova, Padova, Italy), P.Kabir.
Phys. Rev. D (USA), vol.28, no.3, p.667-8 (1 Aug. 1983).
Possible transitions of free neutrons into antineutrons can be severely inhibited by external interactions which distinguish between them. The paper compares the effect of residual gas interactions with that of a magnetic field, and shows how they could counteract each other. (14 refs.)

105540 Conservation laws in the monopole-induced baryon-number-violating processes. A.Sen (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
Phys. Rev. D (USA), vol.28, no.4, p.876-81 (15 Aug. 1983).
Monopole-induced baryon-number-violating processes are analyzed using the conservation laws for the ordinary and the chiral charge densities. It is shown that in the strictly massless limit reactions of the form $u_1+M\to u_2{}^c+d_3{}^c+e^++M$ are ruled out by these conservation laws. This, however, does not mean that the baryon-number-violating processes are suppressed, since reactions of the type $u_1+u_2+M\to d_3{}^c+e^++M$ may take place even if the incoming u_1 and u_2 do not have any appreciable overlap in their wave functions. The role of the Adler-Bell-Jackiw anomaly in the baryon-number-violating processes is investigated. It is shown that the baryon-number violation takes place because of nontrivial boundary conditions at the monopole core, and is independent of the existence of the Adler-Bell-Jackiw anomaly. One may have chirality-conserving as well as chirality-nonconserving baryon-number-violating processes. It is also shown that the inclusion of extra Coulomb energies, e.g. weak or electromagnetic Coulomb energies, cannot qualitatively change the baryon-number-violating effects. (10 refs.)

105541 Vacuum alignment in the breaking of extended hypercolor interactions. J.Leon (Inst. de Estructura de la Materia, Consejo Superior de Investigaciones Cientificas, Madrid, Spain), M.Ramon-Medrano.
Phys. Rev. D (USA), vol.28, no.4, p.915-21 (15 Aug. 1983).
The authors analyze how the search for the true vacuum at the first breaking of an extended-hypercolor-interaction theory determines the physics at energies of the order of Λ_{HC}. The effects of vacuum alignment on the light-fermion spectrum—number of families, isospin violations in fermion mass matrices, along with pseudo-Goldstone-boson and gauge-meson spectra—are explicitly shown in a $SU^L(2)\times SU^C(3)\times U^Y(1)\times SU^{EHC}(8)\times O^{HC'}(6)$ model. 105542 On perturbation theory at finite temperature. D.A.Dicus, D.Down (Center for Particle Theory, Univ. of Texas, Austin, TX, USA), E.W.Kolb.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.525-31 (22 Aug. 1983).
The authors show that the largest temperature-dependent contribution to the fermion self-energy of order α^2 in QED goes as $(\alpha^2T^4/p^2)\ln[(E+p)/(E-p)]$, where p is the 3-momentum and E is the energy, and they speculate on the form of higher-order terms in the perturbation expansion. (7 refs.)

105543 On mass and charge renormalization in QED. M.Berrondo, R.Jauregui (Inst. de Fisica, Univ. of Mexico, Mexico City, Mexico).
KINAM Rev. Fis. (Mexico), vol.5, no.2, p.163-71 (1983).
It is shown that quantum electrodynamics is a consistent theory, without ultraviolet or vacuum-vacuum singularities, when proper care is taken of operator contractions evaluated at coalescing points. (13 refs.)

105544 Finite charge and field renormalizations in reciprocally invariant quantum electrodynamics. E.Prugovecki (Dept. of Math., Univ. of Toronto, Toronto, Canada).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.14, p.501-4 (6 Aug. 1983).
Electrodynamics for extended quantum space-time spin-$^1/_2$ excitons corresponding to the ground state of Born's quantum metric operators (1949) contains only finite renormalization constants. Infinities emerge only in a sharp-point limit that formally represents the limiting case of pointlike excitons. (17 refs.)

105545 Quantum-electrodynamics without renormalization. I. Evaluation of the integrals. J.J.Lodder (FOM-Inst. voor Plasmafysica, Nieuwegein, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.1-29 (1983).
A new theory of generalised functions is applied to the evaluation of the integrals needed in quantum electrodynamics computations. (19 refs.)

105546 Quantum-electrodynamics without renormalization. II. Evaluation of lowest order diagrams. J.J.Lodder (FOM-Inst. voor Plasmafysica, Nieuwegein, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.30-42 (1983).
For pt.I see ibid., vol.120A, p.1-29 (1983). A classification of divergences is given. The Casimir effect is derived and the 'serious' divergences are investigated to second order. (6 refs.)

105547 Quantum-electrodynamics without renormalization. III. Vacuum polarization and the mass of the photon. J.J.Lodder (FOM-Inst. voor Plasmafysica, Nieuwegein, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.566-78 (1983).
For pt.II see ibid., vol.120, p.30-42 (1983). The vacuum-polarization tensor is calculated to second order. The fourth-order photon mass is calculated. The photon mass is shown to be determinate to all orders. Putting it equal to zero may fix the value of the fine-structure constant. (7 refs.)

105548 Quantum-electrodynamics without renormalization. IV. Comparison with renormalized quantum-electrodynamics. J.J.Lodder (FOM-Inst. voor Plasmafysica, Nieuwegein, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.579-86 (1983).
For pt.III see ibid., vol.120, p.566-78 (1983). The generalised function method is shown to be equivalent up to a finite renormalization with standard quantum-electrodynamics (QED). The result is a theory which is complete in a physical sense. A comparison with standard renormalisation theory is given. (16 refs.)

105549 On some exact solutions of the nonlinear equations of quantum electrodynamics. W.I.Fushchich, W.M.Shtelen (Math. Inst., Kiev, USSR).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.215-17 (25 Aug. 1983).
Some exact multiparametrical solutions of the nonlinear equations of quantum electrodynamics are obtained within the framework of the group-theoretical approach. The authors present formulae which generate new solutions from known ones. (17 refs.)

105550 Classical radiation zeros in gauge-theory amplitudes. R.W.Brown (Fermi Nat. Accelerator Lab., Batavia, IL, USA), K.L.Kowalski, S.J.Brodsky.
Phys. Rev. D (USA), vol.28, no.3, p.624-49 (1 Aug. 1983).
The electromagnetic radiation from classical convection currents in relativistic n-particle collisions is shown to vanish in certain kinematical zones, due to complete destructive interference of the classical radiation patterns of the incoming and outgoing charged lines. The authors prove that quantum tree photon amplitudes vanish in the same zones, at arbitrary photon momenta including spin, seagull, and internal-line currents, provided only that the electromagnetic couplings and any other derivative couplings are as prescribed by renormalisable local gauge theory (spins ≤ 1). In particular, the existence of this new class of amplitude zeros requires the familiar gyromagnetic-ratio value $g=2$ for all particles. The location of the zeros is spin independent, depending only on the charges and momenta of the external particles. Such null zones are the relativistic generalisation of the well-known absence of electric and magnetic dipole radiation for nonrelativistic collisions involving particles with the same charge-to-mass ratio and g factor. The origin of zeros in reactions such as $u\bar{d} \to W^+\gamma$ is thus explained and examples with more particles are discussed. Conditions for the null zones to lie in physical regions are established. A new radiation representation, with the zeros manifest and of practical utility independently of whether the null zones are in physical regions is derived for the complete single-photon amplitude in tree approximation, using a gauge-invariant vertex expansion stemming from new internal-radiation decomposition identities. The question of whether amplitudes with closed loops can vanish in null zones is addressed. A low-energy theorem for general quantum amplitudes (including closed loops) is found. Important relations between the photon couplings and Poincare transformations are discovered. The null zone and these relations are discussed in terms of the Bargmann-Michel-Telegdi equation. The extension from photons to general massless gauge bosons is carried out. (61 refs.)

105551 Development of quantum electrodynamics. A.I.Akhiezer.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1121-37 (Aug. 1983). In Russian.
The paper deals with a review of development of quantum electrodynamics as an organic unification of classical electrodynamics, special theory of relativity and quantum mechanics. The importance of the method of quantum electrodynamics construction for creating other field theories is emphasized. Concrete quantum electrodynamic effects in a high-energy region are considered. The relations of quantum electrodynamics with solid-state physics are outlined. The idea of mass and charge renormalization and the Landau and Pomeranchuk zero-charge problem are explained. The further development of the quantum field theory is discussed with the key idea of relation between symmetry and interactions assumed as a basis of the unified theory of electromagnetic and weak interactions and of quantum chromodynamics. (44 refs.)

105552 Dynamic origin of the electron mass in quantum electrodynamics. M.Sh.Pevzner.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1246-51 (Aug. 1983). In Russian.
An iteration procedure is suggested for solving a nonlinear equation for the electron propagator with a cut-off in the ladder approximation. It is shown that a conclusion on instability of a massless phase in quantum electrodynamics with a coupling constant above the critical value made earlier in consideration of the Bethe-Salpeter equation for the fermion-antifermion state remains in force when considering the nonlinear equation for the electron propagator too. (19 refs.)

105553 A test of gauge nature of the W boson in the reaction $e^+e^- \to Z\gamma$. K.-i.Hikasa (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.253-6 (25 Aug. 1983).
Proposes a new method to measure the magnetic moment parameter κ of the charged intermediate weak boson. T-odd asymmetries in the angular distribution of the secondary lepton in the process $e^+e^- \to Z\gamma, Z \to l\bar{l}$ are very sensitive to κ. The asymmetries are calculated in the lowest order from the absorptive part of one-loop diagrams. (12 refs.)

105554 Weak interactions in the region of the Fermi scale. R.Barbieri (Istituto di Fisica, Univ. di Pisa, Pisa, Italy).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.518-24
The author discusses weak interactions in the region of the Fermi scale, with particular reference to supersymmetry breaking and gaugino mass. (no refs.)

12.35C General properties of quantum chromodynamics (dynamics, confinement, etc.)

105555 Anomalous dimensional quark counting of hard processes in QCD. I.S.Avaliani, V.A.Matveev, L.A.Slepchenko (Joint Inst. for Nuclear Res., Dubna, USSR).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.81-103 (15 Aug. 1983).
An approach to the investigation of hard jet and single-particle production asymptotics in hadron collisions is proposed. In the leading order of QCD perturbation theory, the anomalous dimension quark counting (ADQC) rules are derived, which determine the logarithmic corrections to the point-like power asymptotics in terms of anomalous dimensions of the non-singlet and singlet quark and gluon operators. It is argued that taking the quark distribution and fragmentation functions up to the two-loop order does not destroy universality of the proposed ADQC rules. A parameter-free solution for the effective power exponents in a wide class of hard processes is obtained. (26 refs.)

105556 Gauge-invariant effective Lagrangians for Goldstone-like particles of supersymmetric technicolor models. A.J.Buras, W.Slominski (Max-Planck-Inst. fur Phys. & Astrophys., Werner-Heisenberg-Inst. fur Phys., Munich, Germany).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.157-82 (15 Aug. 1983).
The authors point out that generally the low-energy spectrum in supersymmetric technicolor models contains quasi-Goldstone fermions and quasi-Goldstone bosons in addition to the usual (pseudo)-Goldstone bosons. Using the language of Kahler geometry, they present a step-by-step procedure for constructing gauge-invariant non-linear Lagrangians involving the fermionic and bosonic Goldstone particles in situations in which the supersymmetry is preserved. Both the cases of fully gauged and partially gauged global symmetries are considered. They discuss the dynamical version of the super-Higgs mechanism and illustrate it with the supersymmetric Susskind-Weinberg technicolor model. (38 refs.)

105557 Factorization for one-loop corrections in the Drell-Yan process. J.C.Collins (Dept. of Phys., Illinois Inst. of Technol., Chicago, IL, USA), D.E.Soper, G.Sterman.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.381-421 (22 Aug. 1983).
The authors study all the one-loop corrections to the Drell-Yan process in QCD, including gluon exchanges involving spectator partons. The method demonstrates weak factorization at measured dimuon Q^T, and is suitable for generalization to higher orders. (15 refs.)

105558 Possible origin of a natural conservation of flavor in an interaction with neutral Higgs bosons. N.G.Ural'tsev (B.P. Konstantinov Inst. of Nuclear Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.6, p.333-7 (20 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.6, p.281-4 (20 March 1983). [received: Sept. 1983]
In technicolor models the masses of the neutral pseudo-Goldstone bosons which interact with quarks and leptons without flavor conservation automatically acquire an order of magnitude $M \sim (m_q\Lambda_{TC})^{1/2} \sim 0.2\text{-}1$ TeV through the Yukawa interaction. As a result, an effective Lagrangian which conserves only light Higgs bosons satisfies the condition of natural flavor conservation. (4 refs.)

105559 Dependence of low-lying energy eigenvalues on the short- and long-range parts of confining potentials. J.Pasupathy (Centre for Theoretical Studies, Indian Inst. of Sci., Bangalore, India), M.Seetharaman.
J. Phys. G (GB), vol.9, no.9, p.1001-8 (Sept. 1983).
The potential description of a quark-antiquark system seems to work very well in describing a number of hadronic properties. However, the precise form of the potential is unknown. The changes in the low-lying eigenvalues as a result of changes in the long-range part of the potential are investigated in a non-perturbative manner. It is shown by considering a variety of examples that the low-lying eigenvalues are insensitive to the long-range part of the potential. (25 refs.)

105560 Color confinement and asymptotic completeness. T.Suzuki (Dept. of Phys., Kanazawa Univ., Kanazawa, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1827-30 (June 1983).
Studies color-confinement criteria and the quartet mechanism proposed by Kugo and Ojima (1979). Adopting a special gauge, the author finds that the criteria are not always satisfied in 3+1 dimensional QCD. Neither the criteria nor the quartet mechanism works in compact $(QED)_{2+1}$ and abelian

confinement models. Asymptotic completeness and confinement might be incompatible. (9 refs.)

105561 Lattice QCD with light quark masses: does chiral symmetry get broken spontaneously?. I.M.Barbour (Dept. of Natural Philosophy, Univ. of Glasgow, Glasgow, Scotland), J.P.Gilchrist, H.Schneider, G.Schierholz, M.Teper.
Phys. Lett. B (Netherlands), vol.127B, no.6, p.433-9 (11 Aug. 1983).
The authors present a first direct calculation of the properties of QCD for the small quark masses of phenomenological interest without extrapolations. They describe methods specially adapted to invert the fermion matrix at small quark masses. They use these methods to calculate $\langle\bar\psi\psi\rangle$ directly on presently used lattice sizes with different boundary conditions. As is to be expected for a finite system, they do not observe spontaneous chiral symmetry breaking. By comparing the results obtained on lattices of different size, one sees, however, indications that are consistent with eventual spontaneous chiral symmetry breaking in the infinite volume limit. The calculations underline the importance of using antiperiodic boundary conditions for fermions. (17 refs.)

105562 Quark vacuum rearrangement in the strong gluonic field. N.O.Agasyan (Moscow Engng. Phys., Moscow, USSR), D.N.Voskresensky.
Phys. Lett. B (Netherlands), vol.127B, no.6, p.448-52 (11 Aug. 1983).
It is shown that quark-antiquark vacuum rearrangement occurs in a strong gluonic field. The contribution of this to the lagrangian for the case of a strong gluoelectric field A^3 and in the presence of strong gluomagnetic fields $A_n{}^{\pm}$ is determined. Quark condensation changes the colour charge distribution significantly. (17 refs.)

105563 Quantum chromodynamics on a simplicial lattice. R.W.B.Ardill, J.-P.Clarke (Dept. of Math., Royal Holloway Coll., Englefield Green, England), J.-M.Drouffe, K.J.M.Moriarty.
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.203-6 (25 Aug. 1983).
Monte Carlo simulations on a 6^4 simplicial lattice are used to calculate Wilson loops, and hence the string tension, for pure SU(3) gauge theory. The asymptotic freedom scale parameter Λ is measured for both triangles and squares and universality is established. (10 refs.)

105564 Gauge invariant values of gluon masses at high temperature. T.Furusawa, K.Kikkawa (Dept. of Phys., Osaka Univ., Toyonaka, Japan).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.218-20 (25 Aug. 1983).
Both electric and magnetic gluon masses in the high temperature QCD plasma are evaluated up to of order $g^{3/2}$. Gauge covariance is always kept in each step of calculations by taking account of the Ward-Takahashi identity. The magnetic mass is shown to vanish up to $O(g^{3/2}T)$. (10 refs.)

105565 Effective QCD-lagrangian with ξ-function regularisation. W.Dittrich (Inst. for Advanced Study, Princeton, NJ, USA), M.Reuter.
Phys. Lett. B (Netherlands), vol.128B, no.5, p.321-6 (1 Sept. 1983).
The authors show how to construct the effective lagrangian in QCD employing Hawking's ξ-function method (1977). The various loops are attached to all orders to the external covariant constant colormagnetic background field. The construction of the effective potential is far less difficult than the various computations found so far in the literature, e.g. via proper-time or dimensional regularisation methods. (12 refs.)

105566 Cavity quantum chromodynamics. T.H.Hansson, R.L.Jaffe (Dept. of Phys., MIT, Cambridge, MA, USA).
Phys. Rev. D (USA), vol.28, no.4, p.882-907 (15 Aug. 1983).
The authors develop practical and rigorous techniques for calculating and renormalizing loop diagrams in quantum chromodynamics defined in static spherical cavity. Working with Feynman propagators and in the Feynman gauge, they use multiple-reflection expansions for the cavity propagators to isolate and analyze the short-distance singularities in graphs. Nonsingular contributions to graphs are evaluated using a set of 'Feynman rules' in an energy-angular-momentum representation. As an application they describe the calculation of the quark self-energy to lowest order in α_s. They show that the self-energy of a confined massless quark is finite and unambiguous, and that all divergences in the case of a massive quark can be absorbed into a state-independent mass renormalization just as in free space. (18 refs.)

105567 Properties of a classical confining medium in SU_2 gluon dynamics. J.P.Ralston, D.Sivers (High Energy Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).
Phys. Rev. D (USA), vol.28, no.4, p.953-64 (15 Aug. 1983).
The authors examine the properties of a classical nonAbelian system which can be interpreted as the ground state of an extended polarizable medium in Euclidean space. The medium is characterized by the value of two scalar order parameters, $G_{\mu\nu}{}^{a}{}^{*}G_{\mu\nu}{}^{a}=0$ and ${}^{1}/{}_{4}G_{\mu\nu}{}^{a}G_{\mu\nu}{}^{a}=3\sigma^2/g^2$. Starting from the assumption of time independence and spherical symmetry, they are able to find solutions to the classical field equations obeying these constraints and give simple analytic expressions for the vector potential, field-strength tensor, and polarization current in various gauges. They discuss gauge invariants formed from the fields and show that the classical analogs of Wilson loops display an area-law behavior. (22 refs.)

105568 Quantum chromodynamics for static sources in the $A^0=0$ gauge and Schrodinger representation—quantum fluctuations about the classical limit. P.Hoodbhoy (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
Phys. Rev. D (USA), vol.28, no.4, p.965-72 (15 Aug. 1983).
Quantum chromodynamics for static c-number sources is studied nonperturbatively using the canonical formalism with $A^0=0$. Solutions to the functional differential homogeneous Gauss-law equation are found and the issue of Gauss-law constraints on the state vector is approached by transforming to a set of curvilinear gauge-invariant coordinates. When $\hbar$ is small, but finite, collective oscillations of the gluon field about a mean field are found. An illustrative example of a single color charge source is considered. (18 refs.)

105569 Canonical formalism for the relativistic harmonic oscillator. C.Dullemond, E.van Beveren (Inst. for Theoretical Phys., Univ. of Nijmegen, Nijmegen, Netherlands).
Phys. Rev. D (USA), vol.28, no.4, p.1028-32 (15 Aug. 1983).
A Hamiltonian and its associated Lagrangian are presented for classical relativistic point particles which carry out harmonic oscillations inside a spherical cavity of well-defined radius. It is shown that the particles follow geodesics in an alternative metric. The relevance of the model for the description of hadrons is discussed. Electromagnetism can be introduced in the usual way. 12.35E Applications of quantum chromodynamics to particle properties and reactions

105570 Glueballs in the bag models. M.Jezabek (Inst. of Nuclear Phys., Cracow, Poland), J.Szwed.
Acta Phys. Pol. B (Poland), vol.B14, no.8, p.599-607 (Aug. 1983).
The influence of the bag shape on the lowest lying gluonium states is investigated. The MIT and the surface tension version of the bag model are considered. (10 refs.)

105571 Apparent spin-dependent forces in QCD or the quantum chemistry of hadrons. R.Brout (Faculte des Sci., Univ. Libre de Bruxelles, Bruxelles, Belgium).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.104-8 (15 Aug. 1983).
Mesons in QCD are viewed as q$\bar{\mathrm{q}}$ pairs at the ends of a string (electric flux line). The $(\mathrm{mass})^2$ spectrum is approximately linear in the number of nodes, ν, in the wave function $\psi(x)$, x being the fraction of total momentum carried by one quark. For the equal mass case ψ is even (odd) under reflection $x \rightleftharpoons (1-x)$ for ν even (odd). Thus this reflection symmetry is to be interpreted as charge conjugation where $C=+1$ (-1) respectively, and hence by Fermi statistics, singlets (triplets) in spin. Since the spectrum of $(\mathrm{mass})^2$ is evenly spaced in ν, one can represent the even and odd states by two Regge trajectories separated by intercept ${}^{1}/{}_{2}$, thereby explaining the famous ${}^{1}/{}_{2}$ intercept difference for the π, ρ system. The argument generalizes to K, K* as well, but must be further analyzed before it is generalized to baryons. (6 refs.)

105572 On the modification of the estimated masses of the crypto-exotics. P.Mukhopadhyay (Phys. Dept., Jadavpur Univ., Calcutta, India).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.17, p.600-4 (27 Aug. 1983).
The author estimates the masses of crypto-exotic mesons by taking into consideration the pairing effect on the binding energies. (9 refs.)

105573 Baryons as chiral solitons. A.D.Jackson, M.Rho (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.9, p.751-4 (29 Aug. 1983).
Topologically stable solutions to Skyrme's chiral-invariant Lagrangian have been obtained numerically. The single parameter in these solutions has been determined with the Goldberger-Treiman relation. The identification of these objects with baryons leads to sensible statements regarding the sizes and energies of baryons as well as the two- and three-body interactions between baryons at zero separation. (12 refs.)

105574 Gluonic nucleons in a valon bag model. I.Duck, E.Umland (Phys. Dept., Rice Univ., Houston, TX, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.221-4 (25 Aug. 1983).
Two isomers of the nucleon, consisting of three 1S quarks and a transverse electric gluon, are predicted by the bag model to exist at masses around 1600 MeV. Mixing of these states with the nucleons seems unacceptably large. With this motivation the authors reformulate the problem in terms of valons—dressed quark and gluon single-particle eigenstates of (part of) the QCD bag hamiltonian. Now composed of valons, the nucleon and gluonic nucleons are decoupled, thereby retaining previous descriptions of the nucleon. One isomer should be visible in πN elastic scattering and might be the N*(1710). (16 refs.)

105575 Hadron and jet production at collider energies in perturbative QCD. N.G.Antoniou, E.N.Argyres (Nuclear Res. Centre Democritos, Aghia Paraskevi, Attiki, Greece), A.P.Contogouris, S.D.P.Vlassopulos.
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.257-61 (25 Aug. 1983).
Large p_T production of hadrons and jets at collider and ISR energies is studied in conventional perturbative QCD. Recently determined gluon and other parton distributions are used and higher order $[O(\alpha_s{}^3)]$ perturbative corrections (K-factors) are taken into account. Good description of the data is found. The possible role of gluinos and other particles of supersymmetric theories is briefly discussed. (26 refs.)

105576 Exotic mesons from QCD sum rules. J.Govaerts, F.de Viron, D.Gusbin, J.Weyers (Inst. de Phys. Theorique, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.262-8 (25 Aug. 1983).
A simple method is presented to compute the Wilson expansion coefficients for T-products in QCD with light quarks. Using this method in the framework of QCD sum rules the authors predict the masses of quark-antiquark-gluon states with $J^{PC}=1^{-+}$, 0^{++}, 1^{+-} and 0^{--}. (10 refs.)

105577 Meson exchanges in the harmonic-oscillator quark model. M.Bozoian, H.J.Weber (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA).
Phys. Rev. C (USA), vol.28, no.2, p.811-17 (Aug. 1983).
Meson exchanges are introduced into the harmonic oscillator quark model along with a lower quark wave function. The mechanism is based on quark correlations that derive from quark exchange scattering via gluon exchange at short distances. This method allows avoiding spurious van der Waals forces at long range. Meson-baryon coupling constants and vertex form factors are calculated. They are found to be in agreement with those obtained from other quark models, phenomenological potentials, and the broken SU(3) flavor symmetry. The resulting S-wave NN phase shifts are compared with those from quark-molecular models. (27 refs.)

105578 Quark-antiquark potential and Q^2 duality. K.Igi, K.Hikasa (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Phys. Rev. D (USA), vol.28, no.3, p.565-71 (1 Aug. 1983).
A detailed study is made of Q^2 duality for the bb system and the hypothetical heavy tt system using several potentials which include the perturbative QCD results for short distances. It turns out that the QCD corrections are essential in order that the sum rule holds. The Coulomb-type correction should not be neglected, and the gluonic correction to the leptonic width is also important. (31 refs.)

105579 New procedure for the estimation of the extended-hypercolor boson masses. J.Pulido (CERN, Geneva, Switzerland).
Phys. Rev. D (USA), vol.28, no.3, p.572-9 (1 Aug. 1983).
It is found that the natural suppression of flavor-changing neutral currents and *CP*-violating processes which occur in theories with elementary scalars cannot occur in extended-hypercolor (EHC) theories, thereby confirming the serious flaw encountered with these theories. The procedure is based on the calculation of the EHC gauge-boson masses using Feynman rules in the mass-feed-down mechanism and renders these masses independent of a loop cutoff in the expected mass range. (18 refs.)

105580 The Shifman-Vainshtein-Zakharov method: why it works, why it fails, and ways to improve it. L.Durand (Theory Group, Fermi Nat. Accelerator Lab., Batavia, IL, USA), B.Durand, B.Whitenton.
Phys. Rev. D (USA), vol.28, no.3, p.607-23 (1 Aug. 1983).
Shifman, Vainshtein, and Zakharov (SVZ) have proposed a procedure for calculating hadronic masses and determining nonperturbative parameters in QCD using the operator-product expansion for two-point functions and (exponential) moments of the corresponding spectral functions. In the paper the authors present a detailed theoretical analysis of the SVZ procedure in the context of nonrelativistic potential theory. They find that the phenomenological success of the usual first-order SVZ method in relating hadronic energies (masses) is due to a hidden variational principle and a semiclassical structure which gives correct JWKB-type relations between energies. The first-order method fails theoretically: it does not reproduce the correct potential-model or field-theoretic parameters, e.g. the gluon-condensate parameter of QCD. They show why it breaks down in this application, and that its reliability can be greatly improved in all applications by using higher-order approximations for the moment function. Their results are directly relevant for the SVZ analysis of charmonium and *b*-quarkonium. The general conclusions should also hold for light-quark systems. (37 refs.)

105581 Photino and gluino production from quarkonium decay. Wai-Yee Keung (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. D (USA), vol.28, no.5, p.1129-31 (1 Sept. 1983).
The branching ratios of $\Gamma(V\to g\tilde{g}\tilde{g})/\Gamma(V\to 3g)$ and $\Gamma(V\to g\tilde{g}\tilde{\Gamma})/\gamma(V\to gg\gamma)$ could be larger than 10% for the scalar-quark mass less than 1.3 times the mass of the quark in the quarkonium V. The signature of these events would be the large momentum imbalance, especially for the case of the photino production. (7 refs.)

12.35H Phenomenological composite models of particle structure and reactions (partons, bags, etc.)

105582 Elementary particle states based on the Clifford algebra C_7. S.A.Basri (Dept. of Phys., Colorado State Univ., Fort Collins, CO, USA), A.O.Barut.
Int. J. Theor. Phys. (USA), vol.22, no.8, p.691-722 (Aug. 1983).
The lepton isodoublet (e^-,ν_e), the 'bare' nucleon isodoublet (n,p), and their antiparticles are shown to constitute a basis of the irreducible representation of the Clifford algebra C_7. The excited states of these doublets, i.e. (μ^-,ν_μ), (τ^-,ν_τ), ..., and (s^0,c^+), (b^0,t^+) are generated by the products $(e^-,\nu_e)\otimes a$ and $(n,p)\otimes a$, where $a\equiv 2^{-1/2}(e^-e^+ + \nu_e\bar{\nu}_e)$ has the same quantum numbers as the photon state. The bare baryons s, c, b, t carry the strangeness, charm, bottom, and top quantum numbers. These lepton and bare baryon states are in one-to-one correspondence with the integrally charged colored Han-Nambu quarks, and generate all the observed $su(3)$ and $su(4)$ hadron multiplets. (25 refs.)

105583 Topological soliton bag model for baryons. M.Rho, A.S.Goldhaber, G.E.Brown (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.9, p.747-50 (29 Aug. 1983).
Furnishing Skyrme's chiral soliton with a quark-bag core appears to generate a qualitative advance in the phenomenology of nucleon structure. (23 refs.)

105584 Quark and gluon latent heats at the deconfinement phase transition in SU(3) gauge theory. J.Kogut, H.Matsuoka, M.Stone, H.W.Wyld (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), S.Shenker, J.Shigemitsu, D.K.Sinclair.
Phys. Rev. Lett. (USA), vol.51, no.10, p.869-72 (5 Sept. 1983).
The authors have run computer simulations of the quark and gluon internal energies in SU(3) lattice gauge theory neglecting dynamical fermion loops. At the first-order deconfinement-chiral symmetry restoration transition the internal energies display large discontinuities. With finite-size effects estimated by a procedure suggested by the Bielefeld group, the total latent heat per unit volume is found to be roughly 1.50 ± 0.50 GeV/fm^3, if the transition temperature is 190 ± 20 MeV. Timing estimates for fermion computer simulation methods are presented. (12 refs.)

105585 Meson radiation from a quark-gluon plasma by fission of chromoelectric flux tubes. B.Banerjee, N.K.Glendenning, T.Matsui (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Phys. Lett. B (Netherlands), vol.127B, no.6, p.5453-7 (11 Aug. 1983).
The chromoelectric flux tube model is used to obtain a dynamical description of the evaporation of mesons from a quark-gluon plasma. The radiation pressure is computed to assess whether this process is an important mode for the disassembly of a compressed plasma. A new result for the rate of $q\bar{q}$ pair creation, which is the mechanical for fission of the tube, is employed. (9 refs.)

105586 Confined quarks and the Weinberg sum rules. P.Cea, P.Colangelo, G.Nardulli, G.Paiano, G.Preparata (Dipartimento di Fisica, Univ. di Bari, Bari, Italy).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.225-8 (25 Aug. 1983).
Two point-spectral functions for confined quarks are calculated and canonical results for the Weinberg sum rules are recovered. (19 refs.)

105587 Search for supersymmetry in toponium decays. J.Ellis (Stanford Linear Accelerator Centre, Stanford Univ., Stanford, CA, USA), S.Rudaz.
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.248-52 (25 Aug. 1983).
Although cosmology and unification suggest that the mass of the gluino is larger than about 14 GeV, in many theories of broken supersymmetry the photino $\tilde{\gamma}$, gluino $\tilde{g}$ and one of the spin-zero partners $\tilde{t}$ of the t quark can be lighter than m_t. The authors calculate the decay rates for toponium$\to\tilde{g}\tilde{g}$, $\tilde{\gamma}\tilde{\gamma}$ and tt and show that in many models they can be as large as, or larger than, the rate for toponium$\to e^+e^-$ decay. If it is kinematically accessible, the decay $t\to\tilde{t}+\tilde{\gamma}$ dominates the decays of toponium as well as those of naked top states. (11 refs.)

105588 Quark bags and the NN interaction. P.J.Mulders (Lab. for Nuclear Sci., MIT, Cambridge, MA, USA).
Phys. Rev. D (USA), vol.28, no.3, p.443-9 (1 Aug. 1983).
The NN phase shifts can be nicely parametrized with a P matrix with matching radius $b\approx6.0$ GeV$^{-1}\approx1.2$ fm. For the interaction outside this radius a one-pion-exchange potential is used. For the $(I,J^P)=(0,1^+)$ six-quark system a detailed analysis of the P-matrix pole is made. The pole position and the bag-model prediction are in reasonably good agreement. The residue to the NN channel, however, is a factor of 5 larger than the bag prediction. A possible explanation is that in a six-quark bag there are strong color-singlet correlations. This is demonstrated in a simple model. (21 refs.)

105589 Can $\iota(1440)$, $\theta(1640)$, $\delta(980)$, and S*(980) be accommodated in the quarkonium model?. S.Ono (Inst. fur Theoretische Phys., Rheinisch-Westfallschen Tech. Hochschule Aachen, Aachen, Germany).
Phys. Rev. D (USA), vol.28, no.3, p.558-64 (1 Aug. 1983).
The author shows that a potential model with the Breit-Fermi Hamiltonian gives an excellent description for quarkonium systems as in the Isgur-Karl model for baryons. The author concludes that $\iota(1440)$, $\delta(980)$, and $S^*(980)$ can be quarkonium states but $\theta(1640)$ is not a pure $q\bar{q}$ state. (27 refs.)

105590 Bethe-Salpeter basis for quark-pair-creation model: understanding of *VPP*, *VP*γ, and *P*$\gamma\gamma$ couplings. D.Kulshreshtha, A.N.Mitra (Dept. of Phys., Univ. of Delhi, Delhi, India).
Phys. Rev. D (USA), vol.28, no.3, p.588-96 (1 Aug. 1983).
A Bethe-Salpeter harmonic-oscillator framework developed recently for $q\bar{q}$ mesons in the instantaneous (null-plane) approximation, is employed for the construction of MMM couplings ($M=P$ or V) through quark-loop diagrams. The resulting structure of the matrix elements exhibits the central feature of the quark-pair-creation model, that is, a multiplicative structure for the orbital and spin wave functions of all three $q\bar{q}$ states involved, together with a couple of essential kinematical factors (but only in the numerator) as part of the field-theoretic result. The model is illustrated through two typical meson couplings involving equal-mass quarks, $\rho\to\pi\pi$ and $\omega\to\rho\pi$, as well as through the two electromagnetic processes $\omega\to\gamma\pi^0$ and $\pi^0\to\gamma\gamma$. The $\rho\to\pi\pi$ and $\omega\to\gamma\pi^0$ widths (via direct γ coupling) come out as 142.7 MeV and 888 keV, respectively, with no adjustable parameters. The $\omega\to\gamma\pi^0$ matrix element also agrees to within 1%, with that obtained from the corresponding $\omega\rho\pi$ coupling through vector-meson-dominance (VMD) substitution. The $\pi^0\to\gamma\gamma$ width (7.7 eV) agrees excellently with experiment when it is deduced from $\omega\rho\pi$ coupling via double VMD substitution, but the corresponding amplitude obtained from direct γ coupling is only about half the experimental value. Theoretical reasons are given for this apparent paradox. (33 refs.)

105591 Short-time perturbation theory and nonrelativistic duality. J.B.Whitenton, B.Durand (Phys. Dept., Univ. of Wisconsin, Madison, WI, USA), L.Durand.
Phys. Rev. D (USA), vol.28, no.3, p.597-606 (1 Aug. 1983).
The authors give a simple proof of the nonrelativistic duality relation $\langle W^2\sigma_{\mathrm{bound}}\rangle\approx\langle W^2\sigma_{\mathrm{free}}\rangle$ for appropriate energy averages of the cross sections for $e^+e^-\to$($q\bar{q}$ bound states) and $e^+e^-\to$(free $q\bar{q}$ pair), and calculate the corrections to the relation by relating $W^2\sigma$ to the Fourier transform of the Feynman propagation function and developing a short-time perturbation series for that function. They illustrate their results in detail for simple power-law potentials and potentials which involve combinations of powers. (26 refs.)

105592 How to test the quark-line rule by production of neutral mesons in proton-antiproton annihilation. H.Genz (Inst. fur Theoretische Kernphys., Univ. Karlsruhe, Karlsruhe, Germany).
Phys. Rev. D (USA), vol.28, no.5, p.1094-100 (1 Sept. 1983).
Production of several neutral mesons in reactions involving u, d, $\bar{u}$, and $\bar{d}$ quarks only can be used to test the quark-line rule for a given hadronic system. Recent data on $p\bar{p}\to$(two neutral pseudoscalars) are analyzed yielding restrictions on the pseudoscalar mixing angle θ_{PS} in agreement with theoretical estimates. It is emphasized that production of neutral mesons at LEAR can provide meaningful tests of the quark-line rule and theoretical predictions of θ_{PS}. (15 refs.)

105593 Relativistic corrections in quarkonium. P.Moxhay (School of Phys. & Astron., Univ. of Minnesota, Minneapolis, MN, USA), J.L.Rosner.
Phys. Rev. D (USA), vol.28, no.5, p.1132-7 (1 Sept. 1983).
Relativistic corrections to quarkonium energy levels and electric dipole transition rates are calculated. The author finds a consistent description with both electric confinement and tensor quark-antiquark forces at distances beyond that at which perturbative QCD should be valid. The preliminary masses of the χ_b and χ_b' levels are described satisfactorily. The transitions $\Upsilon''\to\gamma\chi_b$, suppressed in some nonrelativistic models, are predicted to be observed here. (28 refs.)

105594 *B*-meson decays and *t*-quark mass. G.L.Fogli (Istituto di Fisica, Univ. di Bari, Bari, Italy).
Phys. Rev. D (USA), vol.28, no.5, p.1153-65 (1 Sept. 1983).
On the basis of a recent left-right-symmetric model of electroweak interactions, in which natural flavor conservation is ensured and *CP* is spontaneously violated, an approach to generalized Cabibbo mixing in a six-quark picture is worked out. The specific form of the mixing-matrix elements in terms of the quark masses is derived and a consistent comparison with the present phe-

nomenological knowledge of quark mixing is performed. In particular *B*-meson decays are reviewed, by including nonspectator effects coming from annihilation and gluon-emission processes, with a careful treatment of the phase-space factors: the emerging picture on the one hand allows severely constraining the *t*-quark mass, and on the other hand leads to specific predictions about future measurements of the decay parameters. (39 refs.)

105595 Baryon spectroscopy. A.J.G.Hey (California Inst. of Technol., Pasadena, CA, USA), R.L.Kelly.
Phys. Rep. (Netherlands), vol.96, no.2-3, p.71-204 (June 1983).
The subject of baryon spectroscopy is reviewed in some detail, from the viewpoints of theory and of the experimental data. In the theoretical section, the status of both pre- and post-QCD quark models is discussed. A brief account of methods of theoretical analysis is included in the section on baryon resonance experiments. (408 refs.)

105596 New flavours: experiment versus theory. From charm to the 4th family. M.Basile (CERN, Geneva, Switzerland), J.Berbiers, G.Bonvicini, G.Cara Romeo, L.Cifarelli, A.Contin, M.Curatolo, G.D'Ali, C.Del Papa, B.Esposito, P.Giusti, T.Massam, R.Nania, G.Natale, F.Palmonari, G.Sartorelli, M.Spinetti, G.Susinno, L.Votano, A.Zichichi.
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.435-77
A new method of searching for heavy flavours 'up-like' and 'down-like' in hadronic interactions at the CERN $p\bar{p}$ Collider is proposed. The method is based on the measurement of the $e^{\pm}$ asymmetry in the proton and antiproton hemispheres. The amplitude of the asymmetry depends on the 'leading' production of baryons and antibaryons—the sign on the 'up-like' or 'down-like' nature of the heavy flavour carried by the baryonic states. A detailed study of cross-section estimates, production and decay distributions, and detection acceptances, shows that the effect looks measurable at the CERN $p\bar{p}$ Collider. (16 refs.)

105597 'Reasonable' expectations for hadroproduction at collider energies. G.Preparata (Dipartimento di Fisica, Univ. di Bari, Bari, Italy).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.525-37
Based on the development of the massive quark model, quark geometrodynamics, and anisotropic chromodynamics, the author introduces the notion of the fire-string. This is a coherent superposition of excited mesonic resonances ($q\bar{q}$) which resemble as closely as possible a $\bar{q}q$-partonic state. The model allows 'reasonable' expectations for hadroproduction at $p\bar{p}$ collider energies to be assessed. (10 refs.)

12.35K Other composite models
(inc. composite quarks and leptons)

105598 Flavour changing neutral processes in a composite model for quarks, leptons and technifermions. K.Yamawaki (Dept. of Phys., Nagoya Univ., Nagoya, Japan), T.Yokota.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.144-56 (15 Aug. 1983).
It is argued that flavour-changing neutral processes may be suppressed in a recently proposed composite model for quarks, leptons and technifermions, in which the technicolour dynamics are asymptotically non-free at the composite level and are assumed to have an ultraviolet fixed point. (18 refs.)

105599 Large *N* limit of composite quarks and leptons. S.Otsuki (Dept. of Phys., Kyushu Univ., Fukuoka, Japan), F.Toyoda.
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1815-18 (June 1983).
Left-right symmetric massless quarks and leptons with the Pati-Salam index composed of fermionic and bosonic preons of *N*-plet of $SU(N)_{\text{subcolor}}$ are discussed. For $N_G=N/4$ generations originated successively from preon pairs, 'allowed' transitions with the same generation are $\sim 1/\sqrt{N}$, while those between generations are at most $\sim 1/N$ for $N\rightarrow\infty$. (7 refs.)

105600 $1/N_{\text{subcolour}}$ and quark-lepton mass hierarchies. K.Matumoto (Dept. of Phys., Toyama Univ., Toyama, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1819-22 (June 1983).
Presents a scenario, on the basis of subcolour confining subquark models including technisubquarks in which $1/N_{\text{subcolour}}$ is the principal factor of quark-lepton mass hierarchies. (12 refs.)

105601 A supersymmetric composite model. F.Bordi (Dept. de Phys. Theorique, Univ. de Geneve, Geneve, Switzerland), R.Casalbuoni, D.Dominici, R.Gatto.
Phys. Lett. B (Netherlands), vol.127B, no.6, p.419-22 (11 Aug. 1983).
The authors present a supersymmetric composite model which extends the model by Abbot and Farhi (1981). Its main feature is to be natural, economic, and compatible with the problem of strong *CP* and massless quarks and leptons. (11 refs.)

105602 Hierarchy of fermion masses in supersymmetric composite models. R.Barbieri (Istituto di Fisica, Univ. di Pisa, Pisa, Italy), A.Masiero, G.Veneziano.
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.179-84 (25 Aug. 1983).
The combined effect of chirality and supersymmetry (through Goldstone partnership) can generate a variety of light mass scales for spin 1/2 composites. The general ideas are illustrated in a one-family example with technicolour-type breaking of the standard low energy group. (12 refs.)

105603 Unified preon models based on simple gauge groups. Y.Kayama, H.Nishimura (Graduate School of Sci. & Technol., Kobe Univ., Kobe, Japan), M.Abe.
Phys. Lett. B (Netherlands), vol.128B, no.5, p.290-4 (1 Sept. 1983).
Unified preon models based on simple gauge groups are investigated. Imposing some appropriate conditions, the authors arrive at two possibilities on SU(9) and another on SU(10). They are incompatible with technicolor. They also discuss a simple breaking pattern of these models to estimate the hypercolour confinement scale. (15 refs.)

105604 Local charge compensation in the quark-cascade jet-production model. S.P.Misra (Inst. of Phys., Bhubaneswar, India), B.K.Parida.
Pramana (India), vol.20, no.5, p.375-85 (May 1983).
The charge correlations and the local charge compensation mechanism in rapidity space for quark jets are analysed in the framework of the quark-cascade jet-production model. The calculated results are compared with those observed experimentally in antineutrino-nucleon processes, and for the short range charge correlations observed in e^+e^- annihilation experiments. The results appear consistent with the quark-cascade model. (27 refs.)

12.40F Bootstrap models

105605 Single-particle spectra in bootstrap model based on dual-topological-unitarization diagrams. K.Hirose (Inst. of Phys., Teikoku Women's Univ., Moriguchi, Japan), T.Kanki.
Phys. Rev. D (USA), vol.28, no.5, p.1101-8 (1 Sept. 1983).
The authors study a bootstrap model of inclusive reactions based on dual-topological-unitarization diagrams of the multi-Regge type. By applying the bootstrap equations developed for the multifireball model, they are able to calculate the branching process of the dual multi-Regge chain, keeping longitudinal-momentum conservation exactly. They calculate various single-particle spectra in pion, kaon, and proton fragmentation. These spectra are compared with experimental data. (19 refs.)

105606 Improved high-energy bound on the logarithmic derivative of scattering amplitudes. B.K.Chung, H.J.Shin (Dept. of Phys., Kyunghee Univ., Seoul, Korea).
Phys. Rev. D (USA), vol.28, no.3, p.653-6 (1 Aug. 1983).
It is proved that the logarithmic derivative of the absorptive part of the scattering amplitude with respect to momentum transfer *t* has an improved rigorous upper bound $(7 \ln s)/[2\sqrt{t}(2-\sqrt{t})]$ for a sequence of $s\rightarrow\infty$. It is also observed that the slope of the Regge trajectory is not only rigorously bounded from above by $7/[2\sqrt{t}(2-\sqrt{t})]$, but also by $1/[2\sqrt{t}(2-\sqrt{t})]$, if the total cross section increases in any fashion as $s\rightarrow\infty$. Here *s* is energy squared and $0<t<4$ (in units of pion mass). (10 refs.)

12.40Q Potential models

105607 Relativistic corrections in potential models. M.G.Olsson (Phys. Dept., Univ. of Wisconsin, Madison, WI, USA), K.J.Miller.
Phys. Rev. D (USA), vol.28, no.3, p.674-6 (1 Aug. 1983).
Following the method of Gromes (1977), the authors calculate effective Hamiltonians for the scalar and an electrostatic potential. By comparing two-particle corrections to the Dirac limit, they eliminate an ambiguity in the corrections to the static propagator. They find that the spin-independent corrections to the scalar potential given by Gromes do not yield the proper Dirac limit, and they present an effective scalar Hamiltonian which does. (10 refs.)

105608 Quasinuclear levels of the $\Lambda\bar{\Lambda}$-$\Sigma\bar{\Sigma}$ system. R.T.Tyapaev, I.S.Shapiro (Moscow Engng. Phys. Inst., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.37, no.6, p.345-9 (20 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.6, p.291-4 (20 March 1983). [received: Sept. 1983]
The amplitudes for elastic scattering and for transitions $\Sigma\bar{\Sigma}\rightarrow\Lambda\bar{\Lambda}$ are calculated for orbital angular momenta $L=1,2$. Coupling with a closed channel substantially reduces the widths of the resonances but has only a negligible effect on the positions of the resonances. Recommendations are offered for an experimental search and a possible interpretation of the most recent data. (10 refs.)

13.00 SPECIFIC REACTIONS AND PHENOMENOLOGY

13.10 WEAK AND ELECTROMAGNETIC INTERACTIONS OF LEPTONS

105609 Role of the production of a pseudoscalar meson with an e^+e^--pair in e^+e^- collisions.. T.Miyazaki, K.Kuniyoshi (Dept. of Phys., Sci. Univ. of Tokyo, Tokyo, Japan).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.17, p.577-82 (27 Aug. 1983).
Discussed is what is known in a model-independent way about the $M_{\gamma\gamma}$ vertex through the processes $l\bar{l}\rightarrow M_\gamma$ and $ll\rightarrow llM$. The exact QED calculation for the cross-section is then done and the lepton-pair distribution is presented in the perpendicular plane. (7 refs.)

105610 Scalar electron production in e^+e^- annihilation. M.Kuroda (Inst. of Theoretical Phys., Univ. of Regensburg, Regensburg, Germany), K.Ishikawa, T.Kobayashi, S.Yamada.
Phys. Lett. B (Netherlands), vol.127B, no.6, p.467-71 (11 Aug. 1983).
The single scalar electron production process $e^+e^-\rightarrow e^\pm$+photino+scalar electron (scalar electron$\rightarrow e^\mp$+photino), with the detection of e^+ as well as e^-, provides a clean method to detect scalar electrons when their masses are not lighter than the beam energy. The authors made a complete calculation of the process and evaluated the production cross sections. (12 refs.)

105611 Search for magnetic monopoles in electron-positron collisions at 34 GeV CM energy. P.Musset, M.Price (CERN, Geneva, Switzerland), E.Lohrmann.
Phys. Lett. B (Netherlands), vol.128B, no.5, p.333-5 (1 Sept. 1983).
A search for heavily ionising particles was carried out at the electron-positron storage ring PETRA with the help of Kapton detectors placed inside the vacuum pipe. The total integrated luminosity was 90 pb^{-1} at CM energies above 34 GeV. The search was sensitive to particles with magnetic charge from $1.137/2e$ to $5.137/2e$ and with masses up to 10-16 GeV/c^2. No such particle was found, leading to an upper limit of the production cross section of monopole-antimonopole pairs of 4×10^{-38} cm^2 (95% CL). (8 refs.)

105612 Test of supersymmetry in e^-e^- collisions. W.-Y.Keung, L.Littenberg (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. D (USA), vol.28, no.5, p.1067-70 (1 Sept. 1983).
The production of scalar electrons in e^-e^- collisions can proceed by exchange of a Majorana fermion, which is the photino in supersymmetric theories. Detection of this process will establish the self-conjugate nature of the photino and thus serve as a test of supersymmetry. Reactions of particular polarization configurations $e_L^-e_L^-$ or $e_R^-e_R^-$ are sensitive to the photino mass. The authors study the predicted cross sections and the event distributions. (7 refs.)

105613 Positivity constraints for the nonperturbative QCD parameters in e^+e^- annihilation. I.Caprini (Central Inst. of Phys., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.4, p.295-308 (1983).
The author investigates the constraints imposed by the positivity properties of the vacuum polarization amplitude upon the QCD nonperturbative parameters, in the framework of the operator product expansion of Shifman, Vainshtein and Zakharov (1979). By using the present experimental data on e^+e^- annihilation into hadrons up to c.m. energies of about 35 GeV, the author obtains quite strong bounds and correlations for the quark and gluon condensate parameters. (16 refs.)

13.15 NEUTRINO INTERACTIONS

(inc. interactions involving cosmic rays)

105614 Coherent π^0 production in neutrino reactions. D.Rein, L.M.Sehgal (Phys. Inst., RWTH, Aachen, Germany).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.29-44 (15 Aug. 1983).
The authors have calculated the cross section and angular distribution of the neutral current process $\nu+N\rightarrow\nu+N+\pi^0$ involving the coherent interaction of a neutrino with a complex nucleus. A contrast is made to incoherent production $\nu+n\rightarrow\nu+n+\pi^0$ on a single nucleon. The results are compared with observations from some recent experiments. (18 refs.)

105615 Multiplicities of secondary hadrons produced in νp and $\bar{\nu}p$ charged current interactions. H.Grassler, D.Lanske, R.Schulte (III. Phys. Inst., Tech. Hochschule, Aachen, Germany), G.T.Jones, R.P.Middleton, S.W.O'Neale, K.Bockmann, W.Gebel, C.Geich-Gimbel, B.Nellen, A.Grant, H.Klein, D.R.O.Morrison, P.Schmid, H.Wachsmuth, J.S.Chima, M.M.Mobayyen, M.Talebzadeh, O.Villalobos-Baillie, M.Aderholz, L.Deck, N.Schmitz, R.Settles, K.L.Wernhard, W.Wittek, G.Corrigan, G.Myatt, D.Radojicic, B.Saitta, J.Wells.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.269-95 (22 Aug. 1983).
In an experiment with the hydrogen bubble chamber BEBC at CERN multiplicities of hadrons produced in νp and $\bar{\nu}p$ interactions have been investigated. Results are presented on the multiplicities of charged hadrons and neutral pions, forward and backward multiplicities of charged hadrons and correlations between forward and backward multiplicities. Comparisons are made with hadronic reactions and e^+e^- annihilation. In the framework of the quark-parton model the data imply similar charged multiplicities for the fragments of a u- and a d-quark, and larger multiplicities for the fragments of a uu- than for a ud-diquark. The correlation data suggest independent fragmentation of the quark and diquark for hadronic masses above ~7 GeV and local charge compensation within an event. (30 refs.)

105616 Production of neutral strange particles in $\bar{\nu}_\mu d_2$ and $\nu_\mu d_2$ charged current interactions. D.Allasia (Istituto di Fisica, Univ. di Torino, Torino, Italy), C.Angelini, S.Barlag, L.Bertanza, A.Bigi, V.Bisi, M.Bloch, F.Bobisut, T.Bolognese, R.Bonarelli, A.Borg, E.Calimani, P.Capiluppi, R.Casali, S.Ciampolillo, P.Van Dam, J.Derkaoui, M.L.Faccini-Turluer, R.Fantechi, V.Flaminio, A.G.Frodesen, D.Gamba, G.Giacomelli, G.Graziani, B.Grung, A.Hornaes, H.Huzita, B.Jongejans, I.Lippi, M.Loreti, C.Louedec, G.Mandrioli, A.Marzari-Chiesa, P.Mazzanti, A.Nappi, R.Pazzi, C.Petri, G.M.Pierazzini, L.Riccati, A.Romero, A.M.Rossi, A.Sconza, P.Serra-Lugaresi, A.Tenner, G.W.Van Apeldoorn, D.Vignaud, C.Visser, R.Wigmans.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.1, p.1-20 (29 Aug. 1983).
The inclusive production of K^0, Λ and $\bar{\Lambda}$ in charged-current (anti)neutrino interactions in deuterium is studied, using the BEBC bubble chamber exposed to the CERN-SPS wide band (anti)neutrino beam. In a selected sample of 8600 charged current $\nu_\mu d_2$ and 6100 $\bar{\nu}_\mu d_2$ interactions, 700 K^0, 448 Λ and 20 $\bar{\Lambda}$ particles were observed. The interactions have been separated in interactions on neutrons and on protons. The production properties are studied in terms of various kinematical variables. The associated production of strange particles, the production of $K^{*\pm}$(890) and of $\Sigma^\pm$(1385) and the inclusive Λ polarization are discussed. The experimental results are compared with the predictions of the Field-Feynman and the Lund fragmentation models. (16 refs.)

105617 Measurement of the ν_μ charged-current cross section. N.J.Baker, P.L.Connolly, S.A.Kahn, M.J.Murtagh, M.Tanaka (Brookhaven Nat. Lab., Upton, NY, USA), C.Baltay, M.Bregman, D.Caroumbalis, L.D.Chen, H.French, M.Hibbs, R.Hylton, P.Igo-Kemenes, J.T.Liu, J.Okamitsu, G.Ormazabal, A.C.Schaffer, K.Shastri, J.Spitzer, E.B.Brucker, P.F.Jacques, M.Kalelkar, E.L.Koller, R.J.Plano, P.E.Stamer, A.Vogel.
Phys. Rev. Lett. (USA), vol.51, no.9, p.735-8 (29 Aug. 1983).
The Fermilab 15-ft bubble chamber, filled with a heavy neon-hydrogen mix, was exposed to a narrow-band ν_μ beam. Based on the observation of 830 charged-current ν_μ interactions, the cross section was found consistent with a linear rise with the neutrino energy in the interval 10 GeV$\leq E_\nu\lesssim$240 GeV. The average slope was determined to be $\sigma_\nu/E_\nu=(0.62\pm0.05)\times10^{-38}$ cm^2 GeV^{-1}. (6 refs.)

105618 $\bar{\nu}_\mu$-nucleon charged-current total cross section for 5-250 GeV. G.N.Taylor, R.J.Cence, F.A.Harris, M.D.Jones, S.I.Parker, M.W.Peters, V.Z.Peterson, V.J.Stenger (Dept. of Phys. & Astron., Univ. of Hawaii, Honolulu, HI, USA), H.C.Ballagh, H.H.Bingham, T.Lawry, J.Lys, M.L.Stevenson, G.P.Yost, D.Gee, F.R.Huson, E.Schmidt, W.Smart, E.Treadwell.
Phys. Rev. Lett. (USA), vol.51, no.9, p.739-42 (29 Aug. 1983).
The $\bar{\nu}_\mu$ charged-current total cross section has been measured with the Fermilab 15-ft bubble chamber plus the external muon identifier and internal 'picket fence.' Beam monitoring information used for the flux calculation was obtained from Blair et al. (1983), whose detector operated in the same dichromatic beam. The present result, averaged over $\bar{\nu}_\mu$ energies from 5 to 250 GeV, is $\sigma/E=(0.340\pm0.019\pm0.022)\times10^{-38}$ cm^2/(GeV nucleon) for an isoscalar target. (17 refs.)

105619 High-energy quasielastic $\nu_\mu n \to \mu^- p$ scattering in deuterium. T.Kitagaki, S.Tanaka, H.Yuta, K.Abe, K.Hasegawa, A.Yamaguchi, K.Tamai, T.Hayashino, Y.Otani, H.Hayano, H.Sagawa (Tohoku Univ., Sendai, Japan), R.A.Burnstein, J.Hanlon, H.A.Rubin, C.Y.Chang, S.Kunori, G.A.Snow, D.Son, P.H.Steinberg, D.Zieminska, R.Engelmann, T.Kafka, S.Sommars, C.C.Chang, W.A.Mann, A.Napier, J.Schneps.
Phys. Rev. D (USA), vol.28, no.3, p.436-42 (1 Aug. 1983).
The authors have studied the quasielastic reaction $\nu_\mu n \to \mu^- p$ in an exposure of the Fermilab deuterium-filled 15-foot bubble chamber to a high-energy wide-band neutrino beam. From an analysis of the Q^2 distribution based on the standard *V-A* theory, the axial-vector mass in a dipole parametrization of the axial-vector form factor is determined to be $M_A = 1.05_{-0.16}^{+0.12}$ GeV, consistent with the values previously reported from low-energy experiments. (18 refs.)

105620 Associated charm production and correlations between multileptons in (anti)neutrino interactions. J.Smith, G.Valenzuela (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. D (USA), vol.28, no.5, p.1071-9 (1 Sept. 1983).
Associated charm production and decay in (anti)neutrino interactions has often been proposed to explain the (anti)neutrino like-sign dimuon events. The authors show that a particular phenomenological model of $c\bar{c}$ production and decay is also capable of explaining both the $\mu^- e^-$ events seen recently in bubble-chamber experiments and a specific fraction of the neutrino-induced trimuon events. The correlations between these different reaction channels strengthen the conclusion that $c\bar{c}$ pairs are formed in approximately 1% of all deep-inelastic (anti)neutrino interactions. (12 refs.)

13.20 LEPTONIC AND SEMILEPTONIC DECAYS OF MESONS

105621 Measurement of the branching ratio for the rare decay $\pi^0 \to e^+e^-$. J.S.Frank, C.M.Hoffman, R.E.Mischke, D.C.Moir, J.S.Sarracino, P.A.Thompson (Los Alamos Nat. Lab., Los Alamos, NM, USA), M.A.Schardt.
Phys. Rev. D (USA), vol.28, no.3, p.423-35 (1 Aug. 1983).
The paper reports the details of an experiment designed to detect the decay $\pi^0 \to e^+e^-$ and to measure its branching ratio. The experiment used a beam of 300-MeV/c π^- mesons incident on a liquid-hydrogen target to produce neutral pions in the reaction $\pi^- p \to \pi^0 n$. Electron-positron pairs were detected in a magnetic spectrometer by multiwire proportional chambers. A gas Cherenkov counter provided electron identification. The effective-mass distribution of e^+e^- pairs was decomposed with the aid of a Monte Carlo simulation of the $\pi^0 \to e^+e^-$ signal and background processes. The result is 59 ± 21 events, which corresponds to $\Gamma(\pi^0 \to e^+e^-)/\Gamma(\pi^0 \to \gamma\gamma) = (17 \pm 6 \pm 3) \times 10^{-8}$, where the first error is due to statistics and the second is an estimate of systematic effects. The central value is almost four times the unitarity lower limit while existing calculations generally predict values no longer than twice the unitary limit. (33 refs.)

105622 Bag-model calculation of leptonic widths. B.Margolis, R.R.Mendel (Phys. Dept., McGill Univ., Montreal, Quebec, Canada).
Phys. Rev. D (USA), vol.28, no.3, p.468-71 (1 Aug. 1983).
The authors calculate leptonic widths of the light vector mesons in a modified MIT bag model, under the assumption that the total quark-antiquark momentum is identically zero in the center-of-mass system of the meson. All free parameters are determined from spectroscopy. One finds agreement with experiment to within 25%. (11 refs.)

105623 Pion decay constant and effective quark mass from relativistic $q\bar{q}$ wave function. T.N.Pham (Centre de Phys. Theorique, Ecole Polytech., Palaiseau, France).
Phys. Rev. D (USA), vol.28, no.3, p.472-5 (1 Aug. 1983).
Expressions for the pion decay constant and $\pi^0 \to 2\gamma$ decay amplitude are given in terms of the effective quark mass m_q assuming a $q\bar{q}$ bound-state structure for massless pion. The pion decay constant is found to be given by $f_\pi = (3/2\pi) m_q$, which gives, for $m_q = 330$ MeV, $f_\pi = 160$ MeV, in good agreement with the measured value of 135 MeV. (10 refs.)

13.25 HADRONIC DECAYS OF MESONS

105624 On the nature of the $\theta(1670)$ state. J.Turnau (Inst. of Nuclear Phys., Cracow, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.8, p.629-32 (Aug. 1983).
It is shown that the quarkonium-gluonium mixture model of $\theta(1670)$ state fails in many points. On the other hand, the mixing of the $s\bar{s}$ state with the $u\bar{u}s\bar{s}$ member of 36-plet is shown to yield the decay properties of f′(1515) and $\theta(1670)$ consistent with the experimental observations. (13 refs.)

105625 Study of the decay $J/\psi \to \gamma\eta\pi\pi$. C.Edwards, R.Partridge, C.Peck, F.C.Porter (Phys. Dept., California Inst. of Technol., Pasadena, CA, USA), D.Antreasyan, Y.F.Gu, W.Kollman, M.Richardson, K.Strauch, A.Weinstein, D.Aschman, M.Cavalli-Sforza, D.Coyne, C.Newman-Holmes, H.F.W.Sadrozinski, D.Gelphman, R.Hofstadter, R.Horisberger, I.Kirkbride, H.Kolanoski, K.Konigsmann, R.Lee, A.Liberman, J.O'Reilly, A.Osterheld, B.Pollock, J.Tompkins, E.D.Bloom, F.Bulos, R.Chestnut, J.Gaiser, G.Godfrey, C.Kiesling, W.Lockman, S.Lowe, M.Oreglia, D.L.Scharre, K.Wacker.
Phys. Rev. Lett. (USA), vol.51, no.10, p.859-62 (5 Sept. 1983).
The radiative decay $J/\psi \to \gamma\eta\pi\pi$ has been studied with data taken with the crystal-ball detector at the SPEAR e^+e^- storage ring. In addition to the well-known η', the $\eta\pi\pi$ mass spectrum shows a broad enhancement centered at ~1700 MeV. The authors have searched for the $\iota(1440)$ in the $\eta\pi\pi$ mass spectrum and find $R(J/\psi \to \gamma\iota)(\iota \to \eta\pi\pi)/R(J/\psi \to \gamma\iota)(\iota \to K\bar{K}\pi) < 0.5$ (90% confidence level). (8 refs.)

105626 Measurement of $\psi(3097)$ and $\psi'(3686)$ decays into selected hadronic modes. M.E.B.Franklin (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA), G.J.Feldman, G.S.Abrams, M.S.Alam, C.A.Blocker, A.Blondel, A.M.Boyarski, M.Breidenbach, D.L.Burke, W.C.Carithers, W.Chinowsky, M.W.Coles, S.Cooper, W.E.Dieterle, J.B.Dillon, J.Dorenbosch, J.M.Dorfan, M.W.Eaton, G.Gidal, G.Goldhaber, G.Hanson, K.G.Hayes, T.Himel, D.G.Hitlin, R.J.Hollebeek, W.R.Innes, J.A.Jaros, P.Jenni, A.D.Johnson, J.A.Kadyk, A.J.Lankford, R.R.Larsen, M.Levi, R.E.Millikan, V.Luth, M.E.Nelson, C.Y.Pang, J.F.Patrick, M.L.Perl, B.Richter, A.Roussarie, D.L.Scharre, R.H.Schindler, R.F.Schwitters, J.L.Siegrist, J.Strait, H.Taureg, M.Tonutti, G.H.Trilling, E.Vella, R.A.Vidal, I.Videau, J.M.Weiss, H.Zaccone.
Phys. Rev. Lett. (USA), vol.51, no.11, p.963-6 (12 Sept. 1983).
Measurements of $\psi(3097)$ and $\psi'(3686)$ branching fractions for selected hadronic decays are presented. The ratio of ψ' to ψ branching fractions for these decays is consistent with the ratio of branching fractions to lepton pairs, with the exception of the decays to $p\pi$ and K^*K for which this ratio is substantially smaller. (6 refs.)

105627 Vector-meson decays in the SLAC lattice quantum-chromodynamic theory. W.F.L.Ward (Dept. 34-10, Lockheed Missiles & Space Co., Sunnyvale, CA, USA).
Phys. Rev. D (USA), vol.28, no.5, p.1138-52 (1 Sept. 1983).
The large-distance-dominated hadronic decays of the K^*, ϕ, and ω mesons of the lowest-lying vector-meson nonet of ordinary flavor SU(3) symmetry are discussed from the point of view of the SLAC lattice Hamiltonian QCD theory. The agreement between the theoretical results and observation is reasonable. This agreement is taken as further evidence for the applicability of the two key ingredients in the calculational procedure to large-distance hadron dynamics. Here, the author has reference to (a) the vacuum-insertion technique of Lee, Primack, and Treiman (1973) for the evaluation of light-hadron matrix elements of effective low-energy interacting densities and (b) the identification of the SLAC lattice currents with the physical hadron currents to leading order in the SLAC order-$1/g^2$ effective Hamiltonian for the fluxless light-hadron sector—in the spirit of Gell-Mann's work (1964) in current algebra. Indeed, when the results of the present paper are combined with the result for the decay $\rho \to \pi\pi$ in the same theoretical framework, the author can say that the SLAC lattice QCD theory, taken together with these two techniques, represents a viable scheme for understanding the large-distance aspects of the hadronic decays of the entire vector-meson nonet of the ordinary SU(3) flavor symmetry. 13.30 DECAYS OF BARYONS

105628 Ω^- and $\Sigma^+ \to p\gamma$ nonleptonic weak decays via current algebra, partial conservation of axial-vector current, and the quark model. M.D.Scadron, M.Visinescu (Phys. Dept., Univ. of Arizona, Tucson, AZ, USA).
Phys. Rev. D (USA), vol.28, no.5, p.1117-24 (1 Sept. 1983).
By employing the current-algebra—PCAC (partial conservation of axial-vector current) program at the hadron level, the three decays $\Omega^- \to \Xi^0\pi^-$, $\Xi^-\pi^0$, ΛK^- are reasonably described in terms of only one fitted $(\Delta I = {}^1/_2)/(\Delta I = {}^3/_2)$ parameter of expected small 6% magnitude. Other parameters needed in the analysis, the baryon octet, and decuplet weak transitions $\langle B' | \mathcal{H}_W{}^{PC} | B \rangle$, $\langle D | \mathcal{H}_W{}^{PV} | B \rangle$, and $\langle D | \mathcal{H}_W{}^{PC} | B \rangle$, are completely constrained from $B \to B'\pi$ weak decays and independently from the quark model. The $\Sigma^+ p\gamma$ radiative decay amplitude and asymmetry parameters are then determined in terms of no free parameters. (34 refs.)

105629 Photon decays of baryons with strangeness. J.W.Darewych, M.Horbatsch, R.Koniuk (Dept. of Phys., York Univ., Downsview, Ontario, Canada).
Phys. Rev. D (USA), vol.28, no.5, p.1125-8 (1 Sept. 1983).
The photon-decay amplitudes and widths of the low-lying strange baryons are calculated within the framework of the nonrelativistic quark model of Isgur and Karl (1978). A comparison with experiment is made. (13 refs.)

13.35 DECAYS OF LEPTONS

105630 Phenomenological structure of weak lepton currents in the reactions of direct and inverse μ decay. B.K.Kerimov, V.A.Kazakov, M.Ya.Safin, V.V.Trefilov (Dept. of theoretical Phys., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.88-94 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.77-82 (1982).
The muon decay $\mu \to e\nu\bar{\nu}$ and the inverse process $\nu_\mu e^- \to \nu_e \mu^-$ are investigated in the case of the interaction of charged and nondiagonal neutral lepton currents of general form. It is shown how the structure of the interaction may be established using experimental data on these processes. On the basis of the known values of the μ-decay parameters, bounds on the coupling constants of the currents are obtained. (10 refs.)

105631 Search for right-handed currents in muon decay. J.Carr, G.Gidal, B.Gobbi, A.Jodidio, C.J.Oram, K.A.Shinsky, H.M.Steiner, D.P.Stoker, M.Strovink, R.D.Tripp (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.627-30 (22 Aug. 1983).
New limits are reported on right-handed currents, based on precise measurement of the e^+ spectrum end point in μ^+ decay. Highly polarized muons from the TRIUMF 'surface' beam were stopped in metal foils within a 1.1-T spin-holding longitudinal field or a 70-G spin-precessing transverse field. For the spin-held data, the *V-A* decay rate vanishes in the beam direction at the end point. Measurement of this rate sets the 90%-confidence limits $\xi P_\mu \delta / \rho > 0.9959$ and $M(W_R) > 380$ GeV, where W_R is the possible right-handed gauge boson. (13 refs.)

105632 Precise measurement of the tau lifetime. J.A.Jaros (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA), D.Amidei, G.H.Trilling, G.S.Abrams, C.A.Blocker, A.M.Boyarski, M.Breidenbach, D.L.Burke, J.M.Dorfan, G.J.Feldman, G.Gidal, L.Gladney, M.S.Gold, G.Goldhaber, L.Golding, G.Hanson, C.Hoard, R.J.Hollebeek, W.R.Innes, J.A.Kadyk, A.J.Lankford, R.R.Larsen, B.LeClaire, M.Levi, N.Lockyer, V.Luth, C.Matteuzzi, M.E.Nelson, R.A.Ong, M.L.Perl, B.Richter, P.C.Rowson, T.Schaad, H.Schellman, D.Schlatter, P.D.Sheldon, J.Strait, C.de la Vaissiere, J.M.Yelton, C.Zaiser.
Phys. Rev. Lett. (USA), vol.51, no.11, p.955-8 (12 Sept. 1983).
The τ lifetime was measured with the Mark II vertex detector at the storage ring PEP. $\tau_\tau=(3.20\pm0.41\pm0.35)\times10^{-12}$ sec was found, which agrees well with e-μ-τ universality. (9 refs.)

105633 A search for decays of heavy neutrinos. F.Bergsma, J.Dorenbosch, M.Jonker, C.Nieuwenhuis (NIKHEF, Amsterdam, Netherlands), J.V.Allaby, U.Amaldi, G.Barbiellini, L.Barone, C.Berger, A.Capone, W.Flegel, L.Lanceri, M.Metcalf, J.Panman, K.Winter, I.Abt, J.Aspiazu, F.W.Busser, H.Daumann, P.D.Gall, F.Niebergall, K.H.Ranitzsch, P.Schutt, P.Stahelin, P.Gorbunov, E.Grigoriev, V.Kaftanov, V.Khovansky, A.Rosanov, A.Baroncelli, B.Borgia, C.Bosio, M.Diemoz, U.Dore, F.Ferroni, E.Longo, L.Luminari, P.Monacelli, F.de Notaristefani, P.Pistilli, C.Santoni, L.Tortora, V.Valente.
Phys. Lett. B (Netherlands), vol.128B, no.5, p.361-6 (1 Sept. 1983).
A search for heavy neutrinos was conducted in the neutrino beam produced by the 400 GeV proton beam-dump and in the 400 GeV wide-band neutrino beam at CERN. A heavy neutrino associated with the τ lepton was searched for in the beam-dump experiment. No assumption on the nature of heavy neutrinos was made in the wide-band beam experiment. A search was made for neutrinos decaying into two electrons and a light neutrino. Since no events were observed, an upper limit on the neutrino mixing angles as a function of the neutrino mass is derived. The beam-dump experiment is sensitive to a neutrino mass range of 10-250 MeV and an upper limit at 90% confidence level on the square of the neutrino mixing angle of $\approx10^{-10}$ was obtained for neutrino masses greater than 180 MeV. The wide-band neutrino experiment is sensitive to neutrinos with a mass in a larger range (10-490 MeV), and for masses greater than 250 MeV yields an upper limit on the square of the neutrino mixing angle of $\approx10^{-6}$. (25 refs.)

13.40 ELECTROMAGNETIC PROCESSES AND PROPERTIES

13.40D Electromagnetic mass differences

105634 Energy dependence of the fundamental parameters of the K^0-$\bar{K}^0$ system. I. Experimental analysis. S.H.Aronson (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA), G.J.Bock, Hai-Yang Cheng, E.Fischbach.
Phys. Rev. D (USA), vol.28, no.3, p.476-94 (1 Aug. 1983).
An analysis of K^0 regeneration data from Fermilab in the energy range 30-110 GeV has been carried out to determine the K_L-K_S mass difference Δm, the K_S lifetime τ_S, and the CP-violation parameter η_{+-}. The authors find that the average values of Δm, τ_S, $\tan\phi_{+-}$, and $|\eta_{+-}|$ at Fermilab energies differ from the accepted low-energy ($\sim$5 GeV) values by approximately 4, 2, 3, and 9 standard deviations, respectively. As a consequence of the discrepancy between low-energy and high-energy values, an investigation of a possible energy dependence of the parameters was carried out. Using two different methods, the parameters were fitted to a form $x=x_0(1+b_x{}^{(N)}\gamma^N)$ where x is any of the parameters Δm, τ_S, $|\eta_{+-}|$, and $\tan\phi_{+-}$, $\gamma=E_K/m_K$ is the usual relativistic factor, and $N=1$ or 2. The resulting slope parameters $b_x{}^{(N)}$ differ from zero by 0-4 standard deviations depending on the parameter and on whether the low-energy value is included. The details of the fits are presented, and a discussion is also given of new experiments which could check and extend the present results. (37 refs.)

105635 Energy dependence of the fundamental parameters of the K^0-$\bar{K}^0$ system. II. Theoretical formalism. S.H.Aronson (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA), G.J.Bock, Hai-Yang Cheng, E.Fischbach.
Phys. Rev. D (USA), vol.28, no.3, p.495-523 (1 Aug. 1983).
For pt.I see ibid., vol.28, no.3, p.476-94 (1983). The authors present a detailed analysis of the previously reported anomalous energy dependence of the fundamental K^0-$\bar{K}^0$ parameters $\Delta m=m_L$-m_S, τ_S, $|\eta_{+-}|$, and $\tan\phi_{+-}$. Such variations with energy can arise from the interaction of the kaons with an external field or medium. A phenomenological formalism is introduced to describe such energy-dependent influences on the K^0-$\bar{K}^0$ system. Using this formalism they demonstrate that effects of the type suggested by the data cannot be ascribed to an interaction of the kaons with an electromagnetic, hypercharge, or gravitational field, or to the scattering of the kaons from stray charges or cosmological neutrinos. The data are, however, compatible with an interaction which is even under charge conjugation, and models of such an interaction are discussed. They also consider the possibility that such effects may arise from a fundamental violation of Lorentz invariance. All of the mechanisms which appear capable of describing the data also suggest that similar effects could arise in neutrino oscillations, and some of the consequences of such a possibility are outlined. (69 refs.)

105636 D^+-D^0 mass difference. V.S.Mathur, M.T.Yamawaki (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).
Phys. Rev. D (USA), vol.28, no.3, p.669-70 (1 Aug. 1983).
The hadronic component of SU(2) mass splitting of heavy pseudoscalar mesons is calculated from QCD sum rules. The electromagnetic component is obtained from a generalisation of the Dashen sum rule. The authors' result for the D^+-D^0 mass difference is in very good agreement with the experimental value. (12 refs.)

105637 Low-mass right-handed gauge bosons, manifest left-right symmetry, and the K_L-K_S mass difference. A.Datta (Dept. of Phys., Jadavpur Univ., Calcutta, India), A.Raychaudhuri.
Phys. Rev. D (USA), vol.28, no.5, p.1170-7 (1 Sept. 1983).
The authors calculate the K_L-K_S mass difference in left-right-symmetric models with four quarks. It is found that a low right-handed mass scale requires strong deviations from manifest left-right symmetry. (19 refs.)

13.40F Electromagnetic form factors; electric and magnetic moments

105638 Pion and nucleon twist-4 structure functions in the limit $x\rightarrow1$. M.Soldate (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.61-80 (15 Aug. 1983).
The $x\rightarrow1$ behavior of the pion and nucleon structure functions is studied here within the framework of the operator product expansion. The work on the twist-4 structure functions is performed in the longitudinal operator basis, which has the advantage that all the exact information known about the operator matrix elements has been used during the transformation into this basis. The simplicity of the twist-4 operator matrix elements is such that it is possible to arrive at power counting arguments for the $x\rightarrow1$ behavior in analogy with the standard counting rules for the twist-2 structure functions. (18 refs.)

105639 Precise measurement of the Σ^+ magnetic moment. C.Ankenbrandt, J.P.Berge, A.E.Brenner, J.Butler, K.Doroba, J.E.Elias, J.Lach, P.Laurikainen, J.MacLachlan, J.Marriner (Fermi Nat. Accelerator Lab., Batavia, IL, USA), E.McCliment, E.W.Anderson, A.Breakstone, T.Cardello, P.S.Cooper, L.J.Teig, J.L.Thron, Y.W.Wah.
Phys. Rev. Lett. (USA), vol.51, no.10, p.863-6 (5 Sept. 1983).
The Σ^+ magnetic moment is measured to be $(2.38\pm0.02)\mu_N$ with use of 44457 polarized $\Sigma^+\rightarrow p\pi^0$ decays in a charged hyperon beam. The inclusively produced Σ^+ in this 210-GeV/c beam have a polarization of about 0.20 for production angles between 2.5 and 7.0 mrad. (9 refs.)

105640 Baryon magnetic moments. G.E.Brown (Phys. Dept., State Univ. of New York, Stony Brook, NY, USA), F.Myhrer.
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.229-34 (25 Aug. 1983).
The authors discuss the baryon magnetic moments using the chiral bag model. The pion cloud contributes significantly to the moments and they point out that pion-pion interactions which enhances this contribution together with an isoscalar part is sufficient to explain the deviation of the baryon magnetic moments from their broken SU(6) values. (31 refs.)

105641 Structure functions of nucleons inside nuclei. J.Szwed (Inst. of Computer Sci., Jagellonian Univ., Cracow, Poland).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.245-7 (25 Aug. 1983).
The structure functions of nucleons inside large nuclei is discussed. The presence of Δ isobars in nuclei, which simulate nuclear interactions, is able to explain the recently measured difference between the structure of bound and free nucleons. (13 refs.)

105642 Quantum-chromodynamic corrections to meson-photon transition form factors. E.Braaten (Dept. of Phys., Univ. of Florida, Gainesville, FL, USA).
Phys. Rev. D (USA), vol.28, no.3, p.524-33 (1 Aug. 1983).
The author calculates corrections to the hard-scattering amplitude for meson-photon transition form factors using dimensional regularization. Special attention is paid to the pseudoscalar case in which there is an ambiguity associated with γ_5. He resolves this ambiguity by appealing to axial-vector Ward identities and check the answer by using a four-dimensional regularization. (12 refs.)

105643 Magnetic moments of the ground-state baryons. M.Gupta, N.Kaur (Dept. of Phys., Panjab Univ., Chandigarh, India).
Phys. Rev. D (USA), vol.28, no.3, p.534-9 (1 Aug. 1983).
Baryon magnetic moments are calculated in the harmonic-oscillator quark model incorporating (i) unlike previous attempts, a natural mass scale for quarks, taken as one-third of the nucleon mass for u and d quarks and the strange-quark mass suggested by Lipkin's sum rule m_s-$m_u=m_\Lambda$-m_p, (ii) a minimal nontrivial mixing, $|8\,{}^1/_2{}^+\rangle=\cos\phi|(56,0^+)_{N=0}\rangle+\sin\phi|(70,0^+)_{N=2}\rangle$, and (iii) replacement of Pauli spinors by Dirac spinors for including relativistic corrections. In the parameter-free nonrelativistic limit, the authors find a fairly good fit, which gets further improved in the relativistic case. (23 refs.)

105644 Neutrino magnetic moment in supersymmetry. S.N.Biswas, A.Goyal, J.N.Passi (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India).
Phys. Rev. D (USA), vol.28, no.3, p.671-3 (1 Aug. 1983).
Contributions to the magnetic moment of a massive neutrino due to the exchanges of supersymmetric partners of the conventional leptons and gauge bosons have been evaluated at the one-loop level. The authors also calculate the neutrino decay rate. Using the constraints on the masses of supersymmetric partners, they find the contribution to be comparable to that obtained in the standard theory. (15 refs.)

105645 Quark model of baryon magnetic moments. L.Brekke, R.G.Sachs (Phys. Dept., Univ. of Chicago, Chicago, IL, USA).
Phys. Rev. D (USA), vol.28, no.5, p.1178-84 (1 Sept. 1983).
The magnetic moments of the baryon octet and the $\Sigma^0\rightarrow\Lambda^0$ transition moment are calculated for the most general form of wave function describing an essentially nonrelativistic constituent quark model. For definiteness the quarks are taken to have Dirac moments. Flavor symmetry is assumed, that is, the Lande g factor is taken to be the same for all the baryons, an assumption that is justified by the small probabilities $({}^2P)^2$, $({}^4P)^2$, and $({}^4D)^2$ suggested by the final results. All of the measured moments can be fitted by this model. Results of making the fit are the following: (1) the ratios of intrinsic quark moments are $\mu_u/\mu_d=-1.93\pm0.09$, $\mu_s/\mu_d=0.79\pm0.12$, (2) the total admixture of decimet and singlet states with the octet amounts to $10\pm14\%$, (3) if $|\mu_d|$ is assumed to be 1 nuclear magneton (μ_N), the probabilities of admixed angular momentum states satisfy the condition ${}^2/_3({}^2P)^2-{}^1/_2({}^4P)^2+({}^4D)^2=0.05\pm0.09$, and (4) within the context of the model there is an upper bound on the absolute value of the $\Sigma^0\rightarrow\Lambda^0$ transition moment equal to $(1.97\pm0.14)\mu_N$ and depending only on the measured values of the seven magnetic moments. A more precise measurement of the transition moment is needed to confirm that it does not exceed this bound. Numerical values are also specified for two matrix elements that may be useful for determining more detailed properties of the wave function in specific models but they will be very model dependent. At present, all of the qualitative features of these results would appear to be consistent with a dynamical model based on simple potentials between constituent quarks augmented by spin-orbit couplings and SU(3)-breaking interactions of the order of magnitude of the 'hyperfine' interaction of De Rujula, Georgi, and Glashow (1975). (11 refs.)

105646 *W* magnetic moment in electroweak mixing and composite models and radiation zeros in $q_i\bar{q}_j\rightarrow W\gamma$. R.W.Robinett (Phys. Dept., Univ. of Wisconsin-Madison, Madison, WI, USA).
Phys. Rev. D (USA), vol.28, no.5, p.1185-91 (1 Sept. 1983).
The same experimental and theoretical constraints that are used to set limits on the masses of the weak bosons in the composite-model versions of elec-

troweak mixing models are used to bound the magnetic-moment parameter of the *W*. The author finds in general electroweak mixing schemes, ones with additional heavy isospin-1 bosons (W'), that off-diagonal weak-boson electromagnetic interactions ($WW'\gamma$ vertices) are allowed. The cross section for the process $q_i\bar{q}_j \to W\gamma$, which has been suggested as the best way to measure the *W* moments, is generalized to include the effects of these off-diagonal couplings as well as arbitrary and independent *W* magnetic dipole and electric quadrupole moments. (29 refs.)

105647 ***W*** **weak multipole moments in electroweak mixing and composite models.** R.W.Robinett (Phys. Dept., Univ. of Wisconsin-Madison, Madison, WI, USA).
Phys. Rev. D (USA), vol.28, no.5, p.1192-7 (1 Sept. 1983).
The form of the *WWZ* vertex, i.e. the *W* weak multipole moments, is examined in composite-model versions of electroweak mixing models. The weak charge e_z and weak-magnetic-moment parameter κ_Z can vary by as much as 40% from their standard-model values. The differential cross section for $f\bar{f} \to W^+W^-$ is generalized to include the effects of arbitrary and independent *W* electromagnetic and weak moments. (23 refs.)

105648 On the spoiling of radiation zeros at the one-loop level and infrared finiteness. M.L.Laursen, M.A.Samuel, A.Sen (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA).
Phys. Rev. D (USA), vol.28, no.3, p.650-2 (1 Aug. 1983).
The authors consider the amplitude for the radiative decay $W^- \to \phi_1\phi_2\gamma$ (scalar quarks) including one-loop gluon corrections. They study this process to see if the amplitude (radiation) zeros found in lowest order survive at the one-loop level. The subset of diagrams containing self-mass insertions preserves the zero. Seagull types are shown to have a violation which is similar to $\kappa \neq 1$. Triangle and box diagrams spoil the zeros as they do in the case of a scalar *W*. However, the amplitude is completely free of any mass singularities in the classical null zone. They conjecture that this will remain true for spin-$^1/_2$ quarks. (11 refs.)

13.40K Electromagnetic corrections to strong and weak interaction processes

105649 Radiative corrections to the helicity asymmetries for the Drell-Yan process in QCD. P.Ratcliffe (Internat. School for Advanced Studies, Trieste, Italy).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.45-60 (15 Aug. 1983).
The next-to-leading-logarithmic corrections to the helicity cross sections for the Drell-Yan process are calculated. While it is wellknown that these corrections are large, it is shown here that when considering the helicity asymmetry (initial-initial) these large radiative effects cancel. Thus the leading-order calculation for the asymmetry is a good approximation. (13 refs.)

105650 Precision predictions for the intermediate vector boson parameters. M.Consoli (Istituto di Fisica, Univ. di Catania, Catania, Italy), L.Maiani.
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.478-88
Accurate measurements of the physical parameters of intermediate vector bosons (IVB) should soon be possible in $\bar{p}p$ and e^+e^- colliders. The authors present the main results of an analysis of radiative corrections to IVB parameters predicted in lowest order. The analysis is restricted to the masses M_w and M_z and to the leptonic decay rates. (11 refs.)

13.60F Elastic and Compton scattering

105651 Two-body form factors at high Q^2. F.Gross (Dept. of Phys., Coll. of William & Mary, Williamsburg, VA, USA), B.D.Keister.
Phys. Rev. C (USA), vol.28, no.2, p.823-35 (Aug. 1983).
The charge form factor of a scalar deuteron at high momentum transfer is examined in a model employing scalar nucleons and mesons. With an eye towards establishing consistency criteria for more realistic calculations, several aspects of the model are examined in detail: the role of nucleon and meson singularities in the one-loop impulse diagram, the role of positive- and negative-energy nucleons, and the relationship to time-ordered perturbation theory. It is found that at large Q^2 (1) the form factor is dominated by a term in which the spectator nucleon is on the mass shell, and (2) the meson singularity structure of the d-n-p vertex function is unimportant in determining the overall high-Q^2 behavior of the form factor. (12 refs.)

(inc. deep-inelastic processes)

105652 Gluon bremsstrahlung in charged lepton-nucleon collisions. II. Gluon linear polarization. O.E.Olsen, H.A.Olsen.
Ark. Fys. Semin. Trondheim (Norway), no.7, p.1-24 (1983).
The linear polarization of gluons emitted in charged lepton-nucleon scattering, including the effects of weak neutral currents, is calculated. The polarization is given in the target nucleon rest system, as well as in the center of mass system. (8 refs.)

105653 $O(4)$ symmetry in inclusive lepton-hadron scatterings. S.Koretune (Dept. of Phys., Fukui Medical School, Fukui, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1746-52 (June 1983).
The method of $O(4)$ symmetry by Freedman and Wang (1967) is applied to inclusive lepton-hadron scatterings. It is shown that Nachtman's moments correctly take into account the kinematical target mass correction even in the region where Wilson's operator product expansion cannot be applied. (8 refs.)

13.60M Meson-resonance production

105654 Evidence for *F* meson at 1970 MeV. A.Chen, M.Goldberg, N.Horwitz, A.Jawahery, P.Lipari, G.C.Moneti, C.G.Trahern, H.Van Hecke (Syracuse Univ., Syracuse, NY, USA), M.S.Alam, S.E.Csorna, L.Garren, M.D.Mestayer, R.S.Panvini, Xia Yi, R.Giles, J.Hassard, M.Hempstead, K.Kinoshita, W.W.MacKay, F.M.Pipkin, R.Wilson, H.Kagan, P.Avery, C.Bebek, K.Berkelman, D.G.Cassel, J.W.DeWire, R.Ehrlich, T.Ferguson, R.Galik, M.G.D.Gilchriese, B.Gittelman, H.Halling, D.L.Hartill, D.Herrup, S.Holzner, M.Ito, J.Kandaswamy, V.Kistiakowsky, D.L.Kreinick, Y.Kubota, N.B.Mistry, F.Morrow, E.Nordberg, M.Ogg, R.Perchonok, R.Plunkett, A.Silverman, P.C.Stein, S.Stone, D.Weber, R.Wilcke, A.J.Sadoff, S.Behrends, K.Chadwick, J.Chauveau, P.Ganci, T.Gentile, J.M.Guida, J.A.Guida, R.Kass, A.C.Melissinos, S.L.Olsen, G.Parkhurst, D.Peterson, R.Poling, C.Rosenfeld, G.Rucinski, P.Tipton, E.H.Thorndike, J.Green, R.G.Hicks, F.Sannes, P.Skubic, A.Snyder, R.Stone.
Phys. Rev. Lett. (USA), vol.51, no.8, p.634-7 (22 Aug. 1983).
Evidence is presented for a narrow meson resonance of mass $1970 \pm 5 \pm 5$ MeV produced in continuum e^+e^- annihilations at $\sqrt{s}$ of 10.5 GeV, and decaying into a ϕ and a charged π. (11 refs.)

13.60P Baryon and baryon resonance production

105655 Photoproduction of hermaphrodite baryons. T.Barnes, F.E.Close (Rutherford Appleton Lab., Chilton, Didcot, England).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.277-80 (25 Aug. 1983).
Shows that photoexcitation of the lightest hermaphrodite baryons is strongly suppressed from photon targets but allowed from neutrons, a result that is reminiscent of a quark model selection rule due to Moorhouse (1966). This is consistent with suggestions that the P_{11} (1710) is the lightest q^3G baryon and eliminates the possibility that the Roper resonance is dominantly an hermaphrodite state. Magnetic moments do not constrain the possibility of considerable mixing of q^3G into the nucleon and delta's Fock space wavefunctions. (17 refs.)

105656 Koba-Nielsen-Olesen scaling and production mechanism in high-energy collisions. Chou Kuang-chao (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China), Liu Lian-sou, Meng Ta-chung.
Phys. Rev. D (USA), vol.28, no.5, p.1080-5 (1 Sept. 1983).
An analysis of the existing data on photoproduction and electroproduction of protons is made. Koba-Nielsen-Olesen (KNO) scaling is observed in both cases. The scaling function of the nondiffractive γp processes turns out to be the same as that for nondiffractive hadron-hadron collisions, but the scaling function for deep-inelastic e^-p collisions is very much different from that for e^-e^+ annihilation processes. Taken together with the observed difference in KNO scaling functions in e^-e^+ annihilation and nondiffractive hadron-hadron processes these empirical facts provide further evidence for the conjecture: The KNO scaling function of a given collision process reflects its reaction mechanism. Arguments for this conjecture are given in terms of a semiclassical picture. It is shown that, in the framework of the proposed picture, explicit expressions for the above-mentioned KNO scaling functions can be derived from rather general assumptions. (27 refs.)

13.65 HADRON PRODUCTION BY ELECTRON-POSITRON COLLISIONS

105657 Search for scalar particles and excited leptons at PETRA. Y.Ducros (Dept. de Phys. des Particules Elementaires, Saclay, Gif-sur-Yvette, France).
Acta Phys. Pol. B (Poland), vol.B14, no.8, p.589-97 (Aug. 1983).
A search for scalar leptons, charged Higgs and excited leptons has been done with the five experiments installed at PETRA (CELLO-JADE-MARK J-PLUTO-TASSO). No scalar lepton or Higgs particles with conventional decay are created in e^+e^- annihilation. The highest value of the mass for such particles is close to the beam energy (17 GeV/c). Direct production of excited leptons also gives a negative result up to a mass value equal to 30 GeV/c^2. Comparison with QED for reaction $e^+e^- \to \gamma\gamma$ gives a limit of 59 GeV/c^2 for the e* mass. (10 refs.)

105658 Soft quark annihilation versus bremsstrahlung mechanisms of dilepton production in e^+e^- collisions. J.Ftacnik (Dept. of Theoretical Phys., Comenius Univ., Bratislava, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.9, p.972-89 (1983).
The spectra of low mass dileptons produced by soft quark-antiquark annihilation mechanism in e^+e^- collisions at $\sqrt{s}=3$ GeV are predicted. The role of background due to the production of low mass dileptons produced via the bremsstrahlung of initial particles is investigated. The experimental observation of soft-annihilation dileptons consistent with the present analysis would give further support to the idea of common partonic origin of low mass dileptons produced in hadron-hadron, lepton-hadron and e^+e^- collisions. (55 refs.)

105659 SU(2)×U(1) effects in e^+e^- annihilation: generalized charge asymmetry. B.F.L.Ward (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.1, p.43-60 (29 Aug. 1983).
The observability of the SU(2)×U(1) electroweak charge asymmetry effects in e^+e^- annihilation at $\sqrt{s}=29$ GeV is addressed in the context of a Feynman-Field type fragmentation model. The author assumes three colors of five flavored quarks and one heavy lepton τ, and neglects at this time, the hard gluon bremsstrahlung events. The author takes $b \rightarrow c+X$ as the b-decay mode and assumes all τs and heavy hadrons decay within the resolution of the detector so that only light hadrons and leptons are detected. Allowing all these decays to occur, the author then computes the expected front-back asymmetry of negatively charged particles weighted with z^n for $z \geq 0.0175$, where $n=0.5, 1, \ldots, 7, 10$, and z is the light-cone momentum fraction. It is found, for example, that such an asymmetry is $\sim 5\%$ for $n=2$ for $\sin^2 \theta_W=0.236$ and $\Lambda_{QCD}=0.34$ GeV. In other words, due to the large number of charge particles produced per event, this SU(2)×U(1) charge asymmetry may be accessible experimentally in $e^+e^- \rightarrow X$ already at PEP and PETRA energies. (19 refs.)

105660 Signals for supersymmetric particles in three-jet events for e^+e^- annihilations. M.J.Herrero, C.Lopez, F.J.Yundurain (Dept. de Fisica Teorica, Univ. Autonoma de Madrid, Madrid, Spain).
Phys. Lett. B (Netherlands), vol.127B, no.6, p.463-6 (11 Aug. 1983).
The authors discuss the e^+e^- production of three jets with supersymmetric particles, $\phi\bar{q}\lambda$ and $\phi^*\phi g$. Formulas for the cross sections are given. They find that, if the ϕ, λ are reasonably light, the signal to background ratio makes it possible that supersymmetry jets be observed at LEP-like energies. (9 refs.)

105661 Energy variation of the analyzing power in the reaction $p_{pol}+p \rightarrow d+\pi^+$. A.Saha, K.K.Seth, D.Kielczewska, S.Iversen, M.Kaletka, D.Barlow, D.Smith (Northwestern Univ., Evanston, IL, USA).
Phys. Rev. Lett. (USA), vol.51, no.9, p.759-62 (29 Aug. 1983).
Precision measurements of the analyzing powers for the reaction $p_{pol}+p \rightarrow d+\pi^+$ have been made at $\simeq 550$, 600, 650, 700, and 800 MeV. The data have been analyzed in terms of Legendre polynomials. It is found that excitation functions for both even and odd Legendre coefficients exhibit very similar resonant behaviors. It is concluded that the triplet amplitudes are as strongly dominated by the $\Delta(1232)$ as the well-known singlet amplitude, ${}^1D_2$, and that the data to not exhibit any anomalous behavior suggestive of dibaryon resonances. (14 refs.)

105662 Structures revealed in the neutron-proton mass spectrum in the deuteron break-up reaction. T.Siemiarczuk, J.Stepaniak, P.Zielinski (High Energy Phys. Lab., Inst. for Nuclear Res., Warsaw, Poland).
Phys. Lett. B (Netherlands), vol.128B, no.5, p.367-70 (1 Sept. 1983).
A sample of 'non-spectator' events in the $dp \rightarrow (pn)\,p$ break-up reaction at 3.3 GeV/c deuteron momentum is studied using films from 1 m hydrogen bubble chamber. The effective mass distribution of two nucleons from the deuteron break-up exhibits enhancements near the sum of neutron and proton masses and at $M_{pn}=2020$ and 2130 MeV. (25 refs.)

105663 The measurement of K_{NN} and K_{LL} in $\vec{p}p \rightarrow \vec{n}X$ at 800 MeV. G.Glass, T.S.Bhatia, J.C.Hiebert, L.C.Northcliffe, W.B.Tippens, B.J.VerWest (Texas A&M Univ., College Station, TX, USA), C.L.Hollas, C.R.Newsom, R.D.Ransome, P.J.Riley, G.P.Pepin, B.E.Bonner, J.E.Simmons.
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.27-30 (15 Sept. 1983).
The spin-transfer parameters K_{NN} and K_{LL} have been measured for $\vec{p}p \rightarrow \vec{n}X$ at 0° and 800 MeV for neutron momenta between 700 and 1200 MeV/c. Peak values of K_{NN} and K_{LL} are -0.30 ± 0.05 and -0.5 ± 0.1 respectively. These results are in substantial disagreement with VerWest's field theoretic model. (10 refs.)

105664 Nucleon-nucleon inelasticities below 1000 MeV. J.H.Gruben, B.J.VerWest (Phys. Dept., Texas A&M Univ., College Station, TX, USA).
Phys. Rev. C (USA), vol.28, no.2, p.836-47 (Aug. 1983).
NN inelasticities are determined from a helicity partial-wave decomposition of a peripheral model for $NN \rightarrow NN\pi$. The helicity partial-wave formalism is presented for the reaction $NN \rightarrow NN\pi$ and the relation between partial-wave helicity amplitudes and NN partial-wave reaction cross sections is derived. Partial-wave cross sections are projected out of the pion- and rho-exchange diagrams with NN and NΔ intermediate states. Below 1000 MeV one obtains significant contributions to the total cross section from many isospin one partial wave while isospin zero inelasticities are non-negligible only for $J=1$. Large ${}^1D_2$ and ${}^3F_3$ inelasticities originate in these first-order Born-approximation terms for $NN \rightarrow NN\pi$ which have no resonance behavior in the NN system. The effects of omitting rho exchange and form factors from the model are studied and determined to be small for $L \gtrsim 3$. Comparisons are made with other calculations of NN inelasticities and show qualitative agreement. (14 refs.)

105665 Inclusive inelastic reaction $np \rightarrow pX$ at 795 MeV. G.Glass, M.Jain, L.C.Northcliffe (Texas A&M Univ., College Station, TX, USA), C.L.Hollas, C.R.Newsom, P.J.Riley, B.E.Bonner, J.E.Simmons.
Phys. Rev. D (USA), vol.28, no.5, p.1045-9 (1 Sept. 1983).
The inclusive reaction $np \rightarrow pX$, where X includes a pion, has been studied at 795 MeV with measurements of the cross section $d^2\sigma/dp\,d\Omega$. Proton momentum spectra were measured for laboratory angles between 0° and 31°. These angles cover the full forward hemisphere in the center-of-mass system and give, with the use of symmetry assumptions, a value for the total reaction cross section, $\rho^R=11.0 \pm 0.8$ mb, exclusive of the $np \rightarrow d\pi^0$ reaction. The data are also presented as measurements of the cross section $d^2\sigma/dt\,dM$, where t is the four-momentum transfer squared and M is the invariant missing mass. The results are compared with a model calculation of one-pion exchange that includes ρ and ω exchange. The t dependence is also discussed in terms of a statistical model. (16 refs.)

105666 Amplitude analysis of elastic p-p scattering at 6 GeV/c at all t's. N.Ghahramany (Dept. of Phys. & Inst. of Theoretical Sci., Univ. of Oregon, Eugene, OR, USA), G.R.Goldstein, M.J.Moravcsik.
Phys. Rev. D (USA), vol.28, no.5, p.1086-93 (1 Sept. 1983).
The extensive set of polarization data obtained at the Argonne Zero Gradient Synchrotron for elastic proton-proton scattering at 6 GeV/c at a full set of values of t is used to determine the five complex reaction amplitudes, using the optimal formalism. The determination is easiest in the transversity formalism, and from that the 'planar' amplitudes (including the helicity amplitudes) are obtained. A complete determination is made at 20 different values of t, from -0.1 to -1.9 (GeV/c)^2, using data interpolated in t. In addition, a less complete set of data permits the determination of the five magnitudes (but not of the four phases) in the range from $t=-1.0$ to $t=-2.0$ (GeV/c)^2. The magnitudes of the five amplitudes can be obtained without any ambiguity, but for the four relative phases several distinct solutions exist, one of which is selected on the basis of continuity in t and minimum χ^2. There continues to be evidence that in the planar system in which the orientation axes are 90° from the helicity axes, all amplitudes tend to be either pure real or pure imaginary. (5 refs.)

$\Delta B=2$ transitions ....See Entry 105498

Quark bags and the NN interaction ....See Entry 105588

13.75G Pion-baryon interactions (energy ≤ 10 GeV)

105667 Energy-dependent partial-wave analysis of the $\pi^+d \rightarrow pp$ reaction in the region $\sqrt{s}=2.09$-2.42 GeV. A.V.Kravtsov, M.G.Ryskin, I.I.Strakovsky (Leningrad Nuclear Phys., Inst., Leningrad, USSR).
J. Phys. G (GB), vol.9, no.9, p.L187-90 (Sept. 1983).
A satisfactory description of available experimental data (1000 points) for the $\pi^+d \rightarrow pp$ process was obtained using a model including ${}^3P_1$, ${}^1D_2$ and ${}^3F_3$ diproton resonances in the $I=1$ channel. (11 refs.)

105668 Measurement of $\pi^-p \rightarrow ne^+e^-$ at 300 MeV/c and a search for scalar and vector bosons heavier than the π^0. C.M.Hoffman, J.S.Frank, R.E.Mischke, D.C.Moir, J.S.Sarracino, P.A.Thompson (Los Alamos Nat. Lab., Los Alamos, NM, USA), M.A.Schardt.
Phys. Rev. D (USA), vol.28, no.3, p.660-2 (1 Aug. 1983).
The authors report the results of an experimental study of the reaction $\pi^-p \rightarrow ne^+e^-$ at 300 MeV/c over the range of e^+e^- effective mass from 140 to 160 MeV/c^2. The observed number of events is only one quarter of that expected from a calculation of inverse pion electroproduction. They see no evidence for the production of light Higgs bosons or any other particle that decays into e^+e^- in this mass region. (11 refs.)

105669 Amplitudes of the $\pi d \rightarrow NN$ process. A.A.Zayats.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1138-41 (Aug. 1983). In Russian.
A general analysis is performed for the $\pi d \rightarrow NN$ process. The treatment involves various amplitudes (invariant, helical, multipole and CMS amplitudes). Relations between the amplitudes and their properties are studied. (14 refs.)

13.75J Kaon-baryon interactions (energy ≤ 10 GeV)

105670 Existence of Ξ resonances above 2 GeV. C.M.Jenkins, J.R.Albright, R.N.Diamond, H.Fenker, J.H.Goldman, S.Hagopian, V.Hagopian, W.Morris (Florida State Univ., Tallahassee, FL, USA), L.Kirsch, R.Poster, P.Schmidt, S.U.Chung, R.C.Fernow, H.Kirk, S.D.Protopopescu, D.P.Weygand, B.T.Meadows, Z.Bar-Yam, J.Dowd, W.Kern, M.Winik.
Phys. Rev. Lett. (USA), vol.51, no.11, p.951-4 (12 Sept. 1983).
Ξ^{*-} production was studied in the reaction $K^-+p \rightarrow K^+_{slow}+X^-$ at 5 GeV/c. The slow K^+ was electronically detected, while the X^- was observed as a missing mass, thus allowing for observation of all Ξ^* independent of decay mode. The observed Ξ states were $\Xi(1320)$, $\Xi(1530)$, $\Xi(1820)$, $\Xi(2030)$, $\Xi(2250)$, $\Xi(2370)$, and $\Xi(2500)$. These data establish and confirm the existence of $\Xi(2250)$ and indicate a peculiar production-cross-section behavior for the $\Xi^*(2370)$. (12 refs.)

(for low energies, see 13.75)

Anomalous dimensional quark counting of hard processes in QCD ....See Entry 105555

13.85D Elastic scattering (energy > 10 GeV)

105671 Proton-antiproton elastic scattering at four-momentum transfer up to 0.5 GeV^2 at the CERN SPS collider. R.Battiston (Istituto di Fisica, Univ. di Pisa, Pisa, Italy), M.Bozzo, P.L.Braccini, F.Carbonara, R.Carrara, R.Castaldi, F.Cervelli, G.Chiefari, E.Drago, M.Haguenauer, B.Koene, G.Matthaie, L.Merola, M.Napolitano, V.Palladino, G.Sanguinetti, G.Sciacca, G.Sette, R.van Swol, J.Timmermans, C.Vannini, J.Velasco, F.Visco.
Phys. Lett. B (Netherlands), vol.127B, no.6, p.472-5 (11 Aug. 1983).
Proton-antiproton elastic scattering was measured at a centre of mass energy $\sqrt{s}=540$ GeV. In the four-momentum transfer range $0.21<-t<0.50$ GeV^2 the t-distribution of about 7000 events is well represented by the exponential shape $\exp(bt)$ with slope parameter $b=13.7 \pm 0.3$ GeV^{-2}. A new measurement of the slope for $-t<0.19$ GeV^2 confirms the earlier result, giving evidence for a change of slope of about 4 GeV^{-2} around $-t \approx 0.15$ GeV^2. (7 refs.)

105672 Elastic and total cross section measurement at the CERN proton-antiproton collider. G.Arnison, A.Astbury (Rutherford Appleton Lab., Chilton, England), B.Aubert, C.Bacci, G.Bauer, A.Bezaguet, R.Bock, R.Bossart, J.Bosser, T.J.V.Bowcock, M.Calvetti, T.Carroll, P.Catz, P.Cennini, S.Centro, F.Ceradini, S.Cittolin, D.Cline, C.Cochet, J.Colas, M.Corden, D.Dallman, M.DeBeer, M.Della Negra, M.Demoulin, D.Denegri, R.Desalvo, A.Diciaccio, D.DiBitonto, L.Dobrzynski, J.Dowell, M.Edwards, K.Eggert, E.Eisenhandler, N.Ellis, P.Erhard, L.Evans, H.Faissner, G.Fontaine, R.Frey, R.Fruhwirth, J.Garvey, S.Geer, C.Ghesquiere, P.Ghez, K.Giboni, W.R.Gibson, Y.Giraud-Heraud, A.Givernaud, A.Gonidec, G.Grayer, P.Gutierrez, T.Hansl-Kozanecka, W.J.Haynes, L.O.Hertzberger, C.Hodges, D.Hoffmann, H.Hoffmann, G.von Holtey, D.J.Holthuizen, R.J.Homer, A.Honma, W.Jank, G.Jorat, P.I.P.Kalmus, V.Karimaki, R.Keeler, I.Kenyon, A.Kernan, R.Kinnunen, H.Kowalski, W.Kozanecki, D.Kryn, F.Lacava, J.-P.Laugier, J.-P.Lees , H.Lehmann, R.Leuchs, A.Leveque, D.Linglin, E.Locci, M.Loret, J.-J.Malosse, T.Markiewicz, G.Maurin, T.McMahon, J.-P.Mendiburu, M.-N.Minard, K.Morgan, M.Moricca, H.Muirhead, F.Muller, A.K.Nandi, L.Naumann, A.Norton, A.Orkin-Lecourtois, L.Paoluzzi, G.Piano Mortari, M.Pimia, A.Placci, M.Rabany, E.Radermacher, J.Ransdell, H.Reithler, J.Rich, J.-P.Revol, M.Rijssenbeek, C.Roberts, J.Rohlf, P.Rossi, C.Rubbia, B.Sadoulet, G.Sajot, G.Salvi, G.Salvini, J.Sass, J.Saudraix, A.Savoy-Navarro, D.Schinzel, W.Scott, T.P.Shah, P.Sievers, D.Smith, M.Spiro, J.Strauss, K.Sumorok, F.Szoncso, C.Tao, G.Thompson, J.Timmer, E.Tscheslog, J.Tuominiemi, J.-P.Vialle, G.Vismara, J.Vrana, V.Vuillemin, H.D.Wahl, P.Watkins, J.Wilson, G.Y.Xie, M.Yvert, E.Zurfluh.
Phys. Lett. B (Netherlands), vol.128B, no.5, p.336-42 (1 Sept. 1983).
Proton-antiproton elastic scattering at CM energy 540 GeV has been studied in the t-range $0.04 < -t < 0.45$ GeV^2. The data are well fitted by the form $\exp(bt)$ with $b=17.1 \pm 1.0$ GeV^{-2} for $|t|=0.04$-0.18 GeV^2 and $b=13.7 \pm 0.2 \pm 0.2$ GeV^{-2} for $|t|=0.21$-0.45 GeV^2. A luminosity measurement combined with the optical theorem gives $\sigma_{tot}=67.6 \pm 5.9 \pm 2.7$ mb and $\sigma_{el}/\sigma_{tot}=0.209 \pm 0.018 \pm 0.008$. (18 refs.)

105673 Comparison of small-angle $p\bar{p}$ and pp elastic scattering at the CERN intersecting storage rings. N.Amos, M.M.Block (Northwestern Univ., Evanston, IL, USA), G.J.Bobbink, M.Botje, D.Favart, C.Leroy, F.Linde, P.Lipnik, J.-P.Matheys, D.Miller, K.Potter, S.Shukla, C.Vander Velde-Wilquet, S.Zucchelli.
Phys. Lett. B (Netherlands), vol.128B, no.5, p.343-8 (1 Sept. 1983).
Antiproton-proton and proton-proton small-angle elastic scattering have been measured for centre-of-mass energies $\sqrt{s}=30.7$ and 62.5 GeV at the CERN Intersecting Storage Rings (ISR). Antiproton-proton total cross sections are obtained using the optical theorem. The measurement of the Coulomb scattering and its interference with the nuclear scattering allows a determination of the ratio of the real-to-imaginary part of the forward nuclear scattering amplitude. Also presented are measurements for the nuclear slope parameter at $\sqrt{s}=62.5$ GeV. The new results reinforce the conclusions drawn recently from measurements at $\sqrt{s}=52.8$ GeV. In particular, the $p\bar{p}$ total cross section is rising at ISR energies and should continue to rise well beyond these energies. (25 refs.)

105674 Elastic scattering and total cross section at the CERN collider. R.Battiston, M.Bozzo, P.L.Braccini, F.Carbonara, R.Carrara, R.Castaldi, F.Cervelli, G.Chiefari, E.Drago, M.Haguenauer, B.Koene, G.Matthiae, L.Merola, M.Napolitano, V.Palladino, G.Sanguinetti, G.Sciacca, G.Sette, R.van Swol, J.Timmermans, C.Vannini, J.Velasco, F.Visco.
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.237-50
In the 1981 Collider run, proton-antiproton elastic scattering was measured in the range $0.05 < -t < 0.19$ GeV^2. The t-distribution could be fitted by the exponential exp (bt) with slope parameter $b=17.2 \pm 1.0$ GeV^{-2}. Combining this data with the measurement of the inelastic interaction rate the total cross-section was found to be $\sigma_t=66 \pm 7$ mb. The ratio σ_{el}/σ_t is 0.20 ± 0.02. In the 1982 run elastic scattering was measured in the range $0.21 < -t < 0.5$ GeV^2. The t-distribution is well described by the slope parameter $b=13.6 \pm 0.5$ GeV^{-2}. A marked variation of the slope parameter with t takes place around $-t=0.15$ GeV^2, an effect similar to that previously observed at the ISR. Measurement of inelastic scattering are also discussed. (13 refs.)

105675 Measurement of small-angle $p\bar{p}$ and pp elastic scattering at the CERN intersecting storage rings. D.Favart (Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.270-81
The small-angle elastic scattering of protons with protons and antiprotons has been measured at 52.8 and 30.4 GeV center-of-mass energy. Using the known total cross-section for pp scattering, a simultaneous fit to the $p\bar{p}$ and pp differential cross sections allows one to determine the difference between the $p\bar{p}$ and pp total cross-sections and the ratio of the real-to-imaginary part of the pp and $p\bar{p}$ forward nuclear scattering amplitudes at both energies. In addition, the nuclear slope parameter at low momentum transfer is obtained for pp and $p\bar{p}$ at 52.8 GeV. (17 refs.)

105676 Small angle elastic scattering at the CERN proton-antiproton collider. G.Arnison, A.Astbury (Rutherford Appleton Lab., Didcot, England), B.Aubert, C.Bacci, G.Bauer, A.Bezaguet, R.Bock, R.Bossart, J.Bosser, T.J.V.Bowcock, M.Calvetti, T.Carroll, P.Catz, P.Cennini, S.Centro, F.Ceradini, S.Cittolin, D.Cline, C.Cochet, J.Colas, M.Corden, D.Dallman, M.DeBeer, M.Della Negra, M.Demoulin, D.Denegri, R.Desalvo, A.Di Ciaccio, D.DiBitonto, L.Dobrzynski, J.Dowell, M.Edwards, K.Eggert, E.Eisenhandler, N.Ellis, P.Erhard, H.Faissner, G.Fontaine, R.Frey, R.Fruhwirth, J.Garvey, S.Geer, C.Ghesquiere, P.Ghez, K.L.Giboni, W.R.Gibson, Y.Giraud-Heraud, A.Givernaud, A.Gonidec, G.Grayer, P.Gutierrez, T.Hansl-Kozanecka, W.J.Haynes, L.O.Hertzberger, C.Hodges, D.Hoffmann, H.Hoffmann, D.J.Holthuizen, R.J.Homer, A.Honma, W.Jank, G.Jorat, P.I.P.Kalmus, V.Karimaki, R.Keeler, I.Kenyon, A.Kernan, R.Kinnunen, H.Kowalski, W.Kozanecki, D.Kryn, F.Lacava, J.-P.Laugier, J.-P.Lees, H.Lehmann, R.Leuchs, A.Leveque, D.Linglin, E.Locci, M.Loret, J.-J.Malosse, T.Markiewicz, G.Maurin, T.McMahon, J.-P.Mendiburu, M.-N.Minard, K.Morgan, M.Moricca, H.Muirhead, F.Muller, A.K.Nandi, L.Naumann, A.Norton, A.Orkin-Lecourtois, L.Paoluzi, G.Piano Mortari, M.Pimia, A.Placci, E.Radermacher, J.Ransdell, H.Reithler, J.-P.Revol, J.Rich, M.Rijssenbeek, C.Roberts, J.Rohlf, P.Rossi, C.Rubbia, B.Sadoulet, G.Sajot, G.Salvi, G.Salvini, J.Sass, J.Saudraix, A.Savoy-Navarro, D.Schinzel, W.Scott, T.P.Shah, M.Spiro, J.Strauss, K.Sumorok, F.Szoncso, D.Smith, C.Tao, G.Thompson, J.Timmer, E.Tscheslog, J.Tuominiemi, J.-P.Vialle, J.Vrana, V.Vuillemin, H.D.Wahl, P.Watkins, J.Wilson, G.Y.Xie, M.Yvert, E.Zurfluh.
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.293-312
Proton-antiproton elastic scattering at a centre of mass energy $\sqrt{s}=540$ GeV has been studied at low momentum transfer. The measured value of the logarithmic slope of the differential elastic cross-section, $b=17.1 \pm 0.9$ GeV^{-2} for $0.04 \leq |t| \leq 0.18$ GeV^2, $b=12.9 \pm 0.3$ GeV^{-2} for $0.19 \leq |t| \leq 0.42$ GeV^2 confirms the previous evidence from the UA1 and UA4 collaborations for an increase at small t. A preliminary estimate of the proton-antiproton total cross-section shows an increase of about 50% from ISR to collider energy. (12 refs.)

13.85H Inelastic scattering, many-particle final states (energy>10GeV)

105677 Experimental indications for a 2^{++} non-$\bar{q}q$ object. V.Chabaud, J.De Groot, B.Hyams, T.Papadopoulou (CERN, Geneva, Switzerland), L.Gorlich, B.Niczyporuk, M.Rozanska, K.Rybicki, J.Turnau, M.Cerrada, H.Dietl, J.Gallivan, B.Gottschalk, E.Lorenz, G.Lutjens, G.Lutz, W.Manner, R.Richter, U.Stierlin, B.Stringfellow.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.1-14 (15 Aug. 1983).
Using high-statistics data from the $\pi p \rightarrow \pi\pi n$ reaction, the authors have remade a model-independent partial-wave analysis in finer mass bins at low four-momentum transfer. The Breit-Wigner fits to the leading waves yield $m_p=(777.4 \pm 2.0)$ MeV and $\Gamma_p=(160_{-4.0}^{+4.1})$ MeV, as well as $m_f=(1273.3 \pm 2.3)$ MeV, $\Gamma_f=(179.2_{-6.6}^{+69})$ MeV and $x_f=(84.9 \pm 2.5)\%$. The last two parameters yield $\Gamma(f \rightarrow \pi\pi)=(152.1 \pm 7.3)$ MeV, a value which is higher than the one resulting from fits to the decays of the $J^{PC}=2^{++}$ mesons. On the basis of a smaller discrepancy. Rosner (1981) has speculated about a non-$\bar{q}q$ admixture (possibly gg) in the f(1270), i.e. $|f(1270)> = |q\bar{q}> \cos\theta + |gg> \sin\theta$. Repeating his fits with more recent data they obtain a considerably more significant effect with $\sin^2\theta=0.18 \pm 0.04$. This sets a mass of an orthogonal state $|f_T> = -|q\bar{q}> \sin\theta + |gg> \cos\theta$ between 1420 and 1620 MeV. The f_T could be identified with a 1440 MeV state seen in some $\bar{K}K$ experiments, A_1 exchange being a possible production mechanism. A fit to the polarized target K^+K^- data at ~18 GeV/c yields $m(f_T)=(1445_{-19}^{+20})$ MeV and $\Gamma(f_T)=(81_{-25}^{+52})$ MeV. (31 refs.)

105678 Multiplicity distributions in $\alpha\alpha$ and αp collisions at the CERN ISR. W.Bell (CERN, Geneva, Switzerland), K.Braune, G.Claesson, D.Drijard, M.A.Faessler, H.G.Fischer, H.Frehse, R.W.Frey, S.Garpman, W.Geist, C.Gruhn, P.C.Gugelot, P.Hanke, M.Heiden, W.Herr, P.G.Innocenti, T.J.Ketel, E.E.Kluge, I.Lund, G.Mornacchi, T.Nakada, I.Otterlund, M.Panter, B.Povh, A.Putzer, K.Rauschnabel, M.Rensch, E.Stenlund, T.J.M.Symons, R.Szwed, O.Ullaland, T.Walcher, M.Wunsch.
Phys. Lett. B (Netherlands), vol.128B, no.5, p.349-53 (1 Sept. 1983).
The multiplicities of charged secondaries from inelastic αp and $\alpha\alpha$ collisions have been measured using the Split-Field Magnet detector at the CERN Intersecting Storage Rings. Corrected multiplicity distributions for $\alpha\alpha$ and αp interactions are compared with those for pp interactions and with theoretical predictions. (18 refs.)

105679 Search for Λp states in the baryon-exchange reaction $pp \rightarrow \Lambda p K^+$ at 11.75 GeV/c. M.W.Arenton, D.S.Ayres, R.Diebold, E.N.May, L.Nodulman, J.R.Sauer, A.B.Wicklund (Argonne Nat. Lab., Argonne, IL, USA), E.C.Swallow.
Phys. Rev. D (USA), vol.28, no.3, p.657-9 (1 Aug. 1983).
The authors have obtained 1400 events of the baryon-exchange reaction $pp \rightarrow \Lambda p K^+$ using the ANL Zero Gradient Synchrotron 11.75-GeV/c polarised proton beam and the effective-mass spectrometer. A search for enhancements in the Λp mass spectrum has been made. No enhancements are observed; in particular, the narrow Λp enhancement at 2.13 GeV seen in $K^- d \rightarrow \Lambda p \pi^-$ is not observed. They establish limits on the production of narrow states of ~10 nb. Also, 100000 events of the forward reaction $pp \rightarrow \Lambda K^+ p$ were examined and no narrow Λp enhancements are seen. (9 refs.)

13.85K Inclusive reactions, including total cross sections, (energy > 10 GeV)

105680 Inclusive meson resonance production in K^+p interactions at 70 GeV/c. M.Barth, C.De Clercq, E.A.De Wolf, J.J.Dumont, D.P.Johnson, J.Lemonne, P.Theocharpoulos (Inter-Univ. Inst. for High Energies, Brussels, Belgium), H.Drevermann, Y.Goldschmidt-Clermont, G.Harigel, C.Milstene, J.P.Porte, R.T.Ross, S.Squarcia, G.Vassiliadis, C.Caso, R.Contri, F.Fontanelli, R.Monge, U.Trevisan, J.F.Baland, J.Beaufays, J.Hanton, F.Grard, L.Gatignon, P.A.van der Poel, D.J.Schotanus, A.Stergiou, R.T.van de Walle, A.A.Borovikov, P.V.Chliapnikov, A.B.Fenyuk, I.A.Gritsaenki, O.V.Kasian, G.N.Khromova, V.M.Kubic, S.B.Lugovsky, V.I.Nikolaenko, Y.L.Petrovikh, V.M.Ronjin, V.A.Uvarov, A.P.Vorobjev.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.296-330 (22 Aug. 1983).
A detailed analysis of inclusive $K^{*+,0}(890)$, $\bar{K}^{*-,0}(890)$, $K^{*+,0}(1420)$, ϕ, ρ^0, and f(1270) resonance production in K^+p interactions at 70 GeV/c is presented. The data are compared with the results available at lower energies and with quark-parton model predictions. The main finding is that fast $K^{*+,0}(890)$, ϕ and ρ^0 production can be interpreted in terms of either single $\bar{s}$ or single u kaon valence quark recombination and thus may provide information about the kaon structure function. It appears that the kaon valence quarks carry about 50% of the K^+ momentum, with the strange $\bar{s}$-quark carrying approximately twice the momentum of the u-quark. (35 refs.)

105681 Infrared properties of two-loop, initial state spectator interactions in the Drell-Yan process. C.A.Nelson (Dept. of Phys., State Univ. of New York, Binghamton, NY, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.2, p.366-80 (22 Aug. 1983).
The author uses the light-cone axial gauge of proper-time ordered perturbation theory and studies the soft-IR properties of the two-loop virtuals' diagrams considered by Bodwin, Brodsky and Lepage (1981) from $\pi\pi \rightarrow \mu^+\mu^- + X$. It is shown that although the systematic summation over all possible spectator interactions removes the outside soft-IR divergences in the non-overlapping ladder Glauber diagrams, unphysical inside soft-IR divergences persist. So, in the light-cone axial gauge the on-shell Glauber region is not a gauge invariant concept which can be physically isolated from radiative corrections which non-trivially involve other diagrammatic regions. Due to gauge invariance it can be potentially misleading in eikonal phenomenologies based on perturbative QCD to assume an ad hoc inside soft-IR cutoff in analyzing possible non-abelian effects in multiple scatterings involving spectators. (16 refs.)

105682 On the scaling behaviour of multiplicity distribution at $\sqrt{s}=540$ GeV and the three-fireball model. Cai Xu, Liu Lian-Sou (Inst. fur Theoretische Phys., Freie Univ. Berlin, Berlin, Germany).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.14, p.495-500 (6 Aug. 1983).
The discrepancy between the $p\bar{p}$ Collider data and the nondiffractive scaling distribution for lower energies is analysed. It is shown that this discrepancy

can readily be explained in the framework of the three-fireball model. (9 refs.)

105683 Prompt muon-neutrino production in a 400-GeV proton beam-dump experiment. R.C.Ball, C.T.Coffin, H.R.Gustafson, L.W.Jones, M.J.Longo, T.J.Roberts, B.P.Roe, E.Wang (Univ. of Michigan, Ann Arbor, MI, USA), C.Castoldi, G.Conforto, M.B.Crisler, J.S.Hoftun, T.Y.Ling, T.A.Romanowski, J.T.Volk, S.Childress, M.E.Duffy, G.K.Fanourakis, R.J.Loveless, D.D.Reeder, D.L.Schumann, E.S.Smith.

Phys. Rev. Lett. (USA), vol.51, no.9, p.743-6 (29 Aug. 1983).

The prompt ν_μ and $\bar{\nu}_\mu$ flux produced by 400-GeV protons has been measured with a detector located 56 m from a tungsten target. The cross section for the hadronic production of charm is determined to be $27\pm4\pm5$ μb/nucleon subject to the following assumptions: $D\bar{D}$ production only; A^1 variation of cross section; and a parameterization of the D-production cross section which is $(1-x)^4 \exp(-2m_\perp)$. The ratio of prompt $\bar{\nu}_\mu$ flux to prompt ν_μ is measured to be $1.12\pm0.24\pm0.17$, consistent with predominantly $D\bar{D}$ production. (17 refs.)

105684 Nuclear enhancement of π^0 and η mesons produced as large transverse momenta. J.Povlis (Fermilab, Batavia, IL, USA), J.Biel, C.Bromberg, B.Brown, C.Chandlee, S.Cihangir, S.R.W.Cooper, T.Ferbel, D.Garelick, G.Glass, M.Glaubman, S.-R.Han, K.Heller, S.Hossain, J.Huston, A.Jonckheere, J.LeBritton, R.A.Lewis, F.Lobkowicz, M.McLaughlin, M.Marshak, C.A.Nelson,Jr., E.Peterson, E.Pothier, K.Ruddick, M.Shupe, P.Slattery, G.A.Smith.

Phys. Rev. Lett. (USA), vol.51, no.11, p.967-70 (12 Sept. 1983).

The authors have measured the large-p_T inclusive cross sections for π^0 and η production near 90° in the center-of-mass system in 200-GeV/c π^+ and proton collisions with beryllium, carbon, and aluminum targets. The cross section for both π^0 and η mesons rises with increasing nucleon number (A) of the target nucleus as A^α, with $\alpha>1$. The ratio of the π^0 yield in pA collisions to that in π^+A collisions decreases with increasing p_T. (9 refs.)

105685 Inclusive production of direct photons in 200-GeV/c collisions. M.McLaughlin (Fermilab, Batavia, IL, USA), J.Biel, C.Bromberg, B.Brown, C.Chandlee, S.Cihangir, S.R.W.Cooper, T.Ferbel, D.Garelick, G.Glass, M.Glaubman, S.-R.Han, K.Heller, S.Hossain, J.Huston, A.Jonckheere, J.LeBritton, R.A.Lewis, F.Lobkowicz, M.Marshak, C.A.Nelson,Jr., E.Peterson, E.Pothier, J.Povlis, K.Ruddick, M.Shupe, P.Slattery, G.A.Smith.

Phys. Rev. Lett. (USA), vol.51, no.11, p.971-4 (12 Sept. 1983).

The authors have measured the inclusive production of direct photons in the transverse momentum (p_T) range 2.1-5.0 GeV/c in 200-GeV/c collisions of protons and π^+ mesons on a carbon target. A significant yield of direct photons was observed for $p_T>2.5$ GeV/c. The invariant cross section for direct-photon production, when compared with measurements from the CERN intersecting storage rings, can be expressed in terms of p_T and $x_T=2p_T\sqrt{s}$ as $(42\pm14)(1-x_T)^{8.1\pm1.0}p_T{}^{-6.6\pm0.3}$ μb/GeV^2 for the c.m. energy range from $\sqrt{s}=19.4$ to 63 GeV, and for the x_T range from 0.2 to 0.5. (11 refs.)

105686 Supersymmetric decay modes of the W and single electron production in p-p̄ collisions. R.Barbeiri (Dipartimento di Fisica, Univ. di Pisa, Pisa, Italy), N.Cabibbo, L.Maiani, S.Petrarca.

Phys. Lett. B (Netherlands), vol.127B, no.6, p.458-62 (11 Aug. 1983).

Scalar electrons and scalar neutrinos may appear among the decay products of the W produced in p-p̄ collisions. Under the assumption that: (se)$\rightarrow$e+photino and (sν_e)$\rightarrow$undetected neutrals, the authors compute the contribution of the decay: W$\rightarrow$(Se)+(sν_3) to the process $p+\bar{p}\rightarrow e^\pm+$missing energy+hadrons. A numerical analysis, performed in the case m(se)=20 GeV and m(sν_3)=0, shows that a visible signal is expected in the region of the electron transverse momentum and angle which is unfavoured by conventional W decays. Related effects in Z production and decay are also discussed. (9 refs.)

105687 Soft gluon component of diphoton and dilepton transverse momentum. G.Pancheri, Y.N.Srivastava (INFN, Lab. Nazionali di Frascati, Frascati, Italy).

Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.235-9 (25 Aug. 1983).

The rise with energy in the mean transverse momentum of diphotons and dileptons produced in hadronic scattering is discussed through an expression obtained by summing soft gluons. Some numerical tests and predictions are presented. (13 refs.)

105688 The dominance of jets at large transverse energy in a full-azimuth hadron calorimeter at ISR energies. T.Akesson (CERN, Geneva, Switzerland), M.G.Albrow, S.Almehed, R.Batley, O.Benary, O.Botner, H.Boggild, H.Breuker, H.Brody, V.Burkert, R.Carosi, A.A.Carter, J.R.Carter, P.Cecil, W.E.Cleland, S.U.Chung, D.Cockerill, S.Dagan, E.Dahl-Jensen, I.Dahl-Jensen, P.Dam, G.Damgaard, S.Eidelman, W.M.Evans, C.W.Fabjan, P.Frandsen, S.Frankel, W.Frati, M.Gibson, U.Goerlach, H.Gordon, A.Hallgren, K.H.Hansen, B.Heck, V.Hedberg, J.Hiddleston, H.J.Hilke, J.Hooper, G.Jarlskog, P.Jeffreys, T.Jensen, A.Kalinovsky, G.Kesseler, T.Killian, R.Kroeger, K.Kulka, J.v.d. Lans, J.Lindsay, D.Lissauer, B.Lorstad, T.Ludlam, A.Markou, N.A.McCubbin, U.Mjornmark, W.Molzon, R.Moller, B.S.Nielsen, A.Nilsson, L.H.Olsen, Y.Oren, L.Rosselet, E.Rosso, A.Rudge, R.Schindler, I.Stumer, M.Sullivan, G.Thorstenson, E.Vella, J.Williamson, W.J.Willis, M.Winik, W.Witzeling, C.Woody, W.A.Zajc.

Phys. Lett. B (Netherlands), vol.128B, no.5, p.354-60 (1 Sept. 1983).

Events with a large transverse energy in a calorimeter with full azimuthal coverage and $|y|<0.9$ have been investigated in pp collisions at $\sqrt{s}=30$, 45, and 63 GeV. A striking change in the event structure, corresponding to a clear emergence of high-p_T jets, is observed at $\sqrt{s}=63$ and 45 GeV in the region between 25 and 35 GeV in transverse energy. At $\sqrt{s}=30$ GeV, the data extend to $E_T\sim20$ GeV, but no such change in the event structure is observed. (12 refs.)

105689 Energetic hadron jets at TeV energies. P.Carruthers, C.C.Shih (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), Minh Duong-Van.

Phys. Rev. D (USA), vol.28, no.3, p.663-6 (1 Aug. 1983).

The authors use recently measured proton gluon distributions to revise previous QCD perturbation theory calculations of very-large-$p\perp$ π^0 and jet inclusive productions. The CERN ISR large-$p_\perp$ π^0 inclusive cross sections and new hard-jet inclusive cross sections from the CERN $\bar{p}p$ collider are well described with a common cutoff Λ and no other adjustable parameters, using the one-loop coupling parameter $\alpha(Q^2)$. Predictions are made for large-$p\perp$ π^0 production at the Fermilab collider, Tevatron I, and a hypothetical future collider of CM energy 10 or 20 TeV. As the energy increases, the gluon-gluon collisions are predicted to become more and more significant, exceeding 60% at 20-TeV energies for $p\perp$ up to 500 GeV/c. (14 refs.)

105690 $\phi\phi$ production in high-energy hadron-hadron collisions and enhancement near threshold. S.P.Misra (Inst. of Phys., Bhubaneswar, India).

Phys. Rev. D (USA), vol.28, no.5, p.1109-12 (1 Sept. 1983).

Excessive $\phi\phi$ production has been seen in $\pi p\rightarrow\phi\phi X$ and $pp\rightarrow\phi\phi X$ with an enhancement near $\phi\phi$ threshold. A lowest-order phenomenological model to interpret this as an evidence of gluon-gluon collisions appears to be consistent with data, and suggests that similar other reactions parallel to photon-photon collisions may also be looked for. (17 refs.)

105691 Physics at the CERN collider using a 'minimum bias' trigger. G.Arnison, A.Astbury (Rutherford Appleton Lab., Didcot, England), B.Aubert, C.Bacci, G.Bauer, A.Bezaguet, R.Bock, T.J.V.Bowcock, M.Calvetti, T.Carroll, P.Catz, P.Cennini, S.Centro, F.Ceradini, S.Cittolin, D.Cline, C.Cochet, J.Colas, M.Corden, D.Dallman, M.DeBeer, M.Della Negra, M.Demoulin, D.Denegri, A.Di Ciaccio, D.DiBitonto, L.Dobrzynski, J.D.Dowell, M.Edwards, K.Eggert, E.Eisenhandler, N.Ellis, P.Erhard, H.Faissner, G.Fontaine, R.Frey, R.Fruhwirth, J.Garvey, S.Geer, C.Ghesquiere, P.Ghez, K.L.Giboni, W.R.Gibson, Y.Giraud-Heraud, A.Givernaud, A.Gonidec, G.Grayer, P.Gutierrez, T.Hansl-Kozanecka, W.J.Haynes, L.O.Hertzberger, C.Hodges, D.Hoffmann, H.Hoffmann, D.J.Holthuizen, R.J.Homer, A.Honma, W.Jank, G.Jorat, P.I.P.Kalmus, V.Karimaki, R.Keeler, I.Kenyon, A.Kernan, R.Kinnunen, H.Kowalski, W.Kozanecki, D.Kryn, F.Lacava, J.-P.Laugier, J.-P.Lees, H.Lehmann, K.Leuchs, A.Leveque, D.Linglin, E.Locci, M.Loret, J.-J.Malosse, T.Markiewicz, G.Maurin, T.McMahon, J.-P.Mendiburu, M.-N.Minard, M.Moricca, H.Muirhead, F.Muller, A.K.Nandi, L.Naumann, A.Norton, A.Orkin-Lecourtois, L.Paoluzi, G.Petrucci, G.Piano Mortari, M.Pimia, A.Placci, E.Radermacher, J.Ransdell, H.Reithler, J.-P.Revol, J.Rich, M.Rijssenbeek, C.Roberts, J.Rohlf, P.Rossi, C.Rubbia, B.Sadoulet, G.Sajot, G.Salvi, G.Salvini, J.Sass, J.Saudraix, A.Savoy-Navarro, D.Schinzel, W.Scott, T.P.Shah, M.Spiro, J.Strauss, K.Sumorok, F.Szoncso, D.Smith, C.Tao, G.Thompson, J.Timmer, E.Tscheslog, J.Tuominiemi, S.Van der Meer, J.-P.Vialle, J.Vrana, V.Vuillemin, H.D.Wahl, P.Watkins, J.Wilson, G.Y.Xie, M.Yvert, E.Zurfluh.

Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.10-49

The authors present results from the CERN p̄p collider of events collected using a minimum bias trigger. The detector is briefly described and the pseudorapidity distributions, multiplicity, and KNO scaling results presented. The transverse energy distributions, correlations, and jets are discussed. (29 refs.)

105692 Inclusive charged and neutral particle production and search for relativistic particles with fractional electric charge at the CERN pp̄ collider. M.Banner, P.Bloch, F.Bonaudi, K.Borer, M.Borghini, J.-C.Chollet, A.G.Clark, C.Conta, P.Darriulat, L.Di Lella, J.Dines-Hansen, P.-A.Dorsaz, L.Fayard, M.Fraternali, D.Foideveaux, J.-M.Gaillard, D.Gildemeister, V.G.Goggi, H.Grote, B.Hahn, H.Hanni, J.R.Hansen, P.Hansen, T.Himel, V.Hungerbuhler, P.Jenni, O.Kofoed-Hansen, M.Livan, S.Loucatos, B.Madsen, P.Mani, B.Mansoulie, G.C.Mantovani, L.Mapelli, B.Merkel, M.Mermikides, R.Mollerud, B.Nilsson, C.Onions, G.Parrour, F.Pastore, H.Plothow-Besch, N.Prevot, J.-P.Repellin, A.Rothernberg, A.Roussarie, G.Sauvage, J.Schacher, J.L.Siegrist, F.Stocker, J.Teiger, V.Vercesi, H.H.Williams, H.Zaccone, W.Zeller, A.Zylberstejn.

Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.50-74

The authors present results on the production of charged and neutral particles at large angle at an energy $\sqrt{s}=540$ GeV. No evidence has been found for the existence of light relativistic quarks. (13 refs.)

105693 Review of results from the UA5 experiment. D.R.Ward (Cavendish Lab., Univ. of Cambridge, Cambridge, England).

Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.75-111

The author presents a general review of the results obtained from the UA5 streamer chamber experiment in the first year of operation of the CERN SPS-collider at $\sqrt{s}=540$ GeV. Particular emphasis is placed on recent results on particle multiplicities and on preliminary results from the latest runs of UA5 in September 1982. (21 refs.)

105694 Multiplicity correlations in p̄p-collisions at 540 GeV. G.Ekspong (Stockholm Univ., Stockholm, Sweden).

Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.112-22

Multiplicity correlations of long range in pseudorapidity are found to be stronger than at ISR energies. The analysis gives no evidence for intrinsic long range correlations. The data are consistent with a physical picture involving random emission of small clusters along the rapidity plateau. The average cluster size is about 2 charged particles, the same as at ISR energies. (4 refs.)

105695 Experimental observation of isolated large transverse energy electrons with associated missing energy at $\sqrt{s}=540$ GeV. G.Arnison, A.Astbury (Rutherford Appleton Lab., Didcot, England), B.Aubert, C.Bacci, G.Bauer, A.Bezaguet, R.Bock, T.J.V.Bowcock, M.Calvetti, T.Carroll, P.Catz, P.Cennini, S.Centro, F.Ceradini, S.Cittolin, D.Cline, C.Cochet, J.Colas, M.Corden, D.Dallman, M.DeBeer, M.Della Negra, M.Demoulin, D.Denegri, A.Di Ciaccio, D.DiBitonto, L.Dobrzynski, J.D.Dowell, M.Edwards, K.Eggert, E.Eisenhandler, N.Ellis, P.Erhard, H.Faissner, G.Fontaine, R.Frey, R.Fruhwirth, J.Garvey, S.Geer, C.Ghesquiere, P.Ghez, K.L.Giboni, W.R.Gibson, Y.Giraud-Heraud, A.Givernaud, A.Gonidec, G.Grayer, P.Gutierrez, T.Hansl-Kozanecka, W.J.Haynes, L.O.Hertzberger, C.Hodges, D.Hoffmann, H.Hoffmann, D.J.Holthuizen, R.J.Homer, A.Honma, W.Jank, G.Jorat, P.I.P.Kalmus, V.Karimaki, R.Keeler, I.Kenyon, A.Kernan, R.Kinnunen, H.Kowalski, W.Kozanecki, D.Kryn, F.Lacava, J.-P.Laugier, J.-P.Lees, H.Lehmann, K.Leuchs, A.Leveque, D.Linglin, E.Locci, M.Loret, J.-J.Malosse, T.Markiewicz, G.Maurin, T.McMahon, J.-P.Mendiburu, M.-N.Minard, M.Moricca, H.Muirhead, F.Muller, A.K.Nandi, L.Naumann, A.Norton, A.Orkin-Lacourtois, L.Paoluzi, G.Petrucci, G.Piano Mortari, M.Pimia, A.Placci, E.Radermacher, J.Ransdell, H.Reithler, J.-P.Revol, J.Rich, M.Rijssenbeek, C.Roberts, J.Rohlf, P.Rossi, C.Rubbia, B.Sadoulet, G.Sajot, G.Salvi, G.Salvini, J.Sass, J.Saudraix, A.Savoy-Navarro, D.Schinzel, W.Scott, T.P.Shah, M.Spiro, J.Strauss, K.Sumorok, F.Szoncso, D.Smith, C.Tao, G.Thompson, J.Timmer, E.Tscheslog, J.Touminiemi, S.Van der Meer, J.-P.Vialle, J.Vrana, V.Vuillemin, H.D.Wahl, P.Watkins, J.Wilson, G.Y.Xie, M.Yvert, E.Zurfluh.

Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.123-90

Reports the results of two searches made on data recorded at the CERN SPS p̄p Collider: one for isolated large-E_T electrons, the other for large-E_T neutrinos using the technique of missing transverse energy. Both searches converge to the same events, which have the signature of a two-body decay of a particle mass in excess of 70 GeV/c^2. The topology as well as the number of events fits well the hypothesis that they are produced by the process $\bar{p}p\rightarrow W^\pm X$, with $W^\pm\rightarrow e^\pm\nu$. (10 refs.)

105696 Preliminary searches for hadron jets and for large transverse momentum electrons at the SPS $\bar{p}p$ collider. M.Banner (CENS, Gif-sur-Yvette, France), R.Battiston, P.Bloch, F.Bonaudi, K.Borer, M.Borghini, J.-C.Chollet, A.G.Clark, C.Conta, P.Darriulat, L.Di Lella, J.Dines-Hansen, P.-A.Dorsaz, L.Fayard, M.Fraternali, D.Froidevaux, J.-M.Gaillard, O.Gildemeister, V.G.Goggi, H.Grote, B.Hahn, H.Hanni, J.R.Hansen, P.Hansen, T.Himel, V.Hungerbuhler, P.Jenni, O.Kofoed-Hansen, E.Lancon, M.Livan, S.Loucatos, B.Madsen, P.Mani, B.Mansoulie, G.C.Mantovani, L.Mapelli, B.Merkel, M.Mermikides, R.Mollerud, B.Nilsson, C.Onions, G.Parrour, F.Pastore, H.Plothow-Besch, M.Polverel, J.-P.Repellin, A.Rothenberg, A.Roussarie, G.Sauvage, J.Schacher, J.-L.Siegrist, H.M.Steiner, G.Stimpfl, F.Stocker, J.Teiger, V.Vercesi, A.Weidberg, H.Zaccone, W.Zeller.
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.190-236
The authors present a preliminary analysis of the UA2 data collected during the last Collider run (20 nb^{-1} integrated luminosity) with particular emphasis on large transverse momentum hadron jets and on electrons having the configuration expected from the decay of electroweak bosons. The data provide very strong evidence of two-jet dominance in events with large transverse energy in the central region. Four electron candidates have been observed with a transverse momentum in excess of 20 GeV/c, which are associated with no other large transverse energy production within the UA2 acceptance. While this result is in all respects consistent with a $W \rightarrow e\nu$ hypothesis, more work is needed to ensure that the background is well understood and to further ascertain electron identification. No electron pair was detected with an invariant mass in excess of 40 GeV/c^2. (8 refs.)

105697 Measurements of σ_{tot}, $d\sigma_{el}/dt$, and event distributions in $\bar{p}p$ and pp collisions at $\sqrt{s}=31$, 53, and 63 GeV. M.Ambrosio, G.Anzivino, G.Barbarino, G.Carboni, V.Cavasinni, T.Del Prete, P.D.Grannis, D.Lloyd Owen, M.Morganti, G.Paternoster, S.Patricelli, F.Schiavo, M.Valdata-Nappi.
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.251-69
Experiment R210 has been designed with the primary aim of measuring precisely $\sigma_{tot}(\bar{p}p)$ and $\sigma_{tot}(pp)$ over the ISR energy range. The experiment is also equipped with small-angle detectors which allow one to measure $d\sigma_{el}/dt$, and with a system of drift chambers and scintillation hodoscopes to measure charged multiplicities and angular distributions of emitted secondaries. Data have been collected at $\sqrt{s}=31$, 53, and 63 GeV. (no refs.)

105698 Recent large transverse momentum results from the ISR. L.Camilleri (CERN, Geneva, Switzerland).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.282-9
Results are presented on the comparison of high p_T phenomena in $p\bar{p}$ and pp collisions and on studies of jets in total energy triggers. The R110 and R807 experiments on the CERN intersecting storage rings are discussed. (7 refs.)

105699 Elastic scattering and total cross-sections. A.Martin (CERN, Geneva, Switzerland).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.351-71
The author confronts recent data on pp and $p\bar{p}$ at the ISR and at the collider with rigorous results and with various models. It is shown that precise measurements at presently available energies and at higher energies will allow one to clarify the situation. (28 refs.)

105700 QCD and $p\bar{p}$ collider physics. G.Altarelli (Istituto di Fisica, Univ. di Roma I, Roma, Italy).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.372-92
The author considers $\bar{p}p$ production of jets at large transverse momentum; most of these are predicted to be gluon jets. Cross section and multiplicity data is presented as validation of QCD. (19 refs.)

105701 Observation and study of jets at high p_T with UA1 central calorimetry. J.Sass (CENS, Gif-sur-Yvette, France).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.393-404
The status of the jets studies in UA1 is presented. The author considers the apparatus and calibration, and data samples for various trigger conditions. The jet finding method is discussed and the results and statistical analysis shown. (no refs.)

105702 Production of transverse energy (E_T) in hadron collisions. M.Greco (Lab. Nazionali di Frascati, INFN, Frascati, Italy).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.496-502
The author considers the properties of high E_T hadronic events produced in purely hadronic processes and Drell-Yan processes. The similarities between these two classes of processes and possible links based on the present understanding of perturbative QCD beyond the leading logarithmic approximation are discussed. (5 refs.)

105703 QCD radiation and the multiplicity distribution at the collider. G.Pancheri (Lab. Nazionali di Frascati, INFN, Frascati, Italy).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.503-13
The multiplicity distribution in hadron-hadron collisions is discussed as arising from the soft gluon bremsstrahlung accompanying parton-parton scattering, KNO scaling is mean scaling in the energy variable and is seen to arise when the microscopic system of quarks and gluons is averaged over the hadronic matter coordinates. The shape of the multiplicity distribution for the UA1 data at the collider energy is well fitted by a soft QCD radiation formula, using a QCD parameter $\Lambda \simeq 100$ MeV. The reduced cumulants γ_i are expected to decrease with energy. (16 refs.)

105704 Hadronic jets. M.Jacob (CERN, Geneva, Switzerland).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.538-52
The impressive results on jets obtained at the $p\bar{p}$ collider are considered. The author assesses the progress made, and focuses on the correct estimates of large effects using perturbative QCD. (34 refs.)

13.88 POLARISATION IN INTERACTIONS AND SCATTERING

105705 Spin alignment of rho mesons produced in $\bar{p}p$ collisions and quark recombination model. J.Ftacnik, P.Lichard, J.Pisut (Dept. of Theoretical Phys. Comenius Univ., Bratislava, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.8, p.889-902 (1983).
The ρ^0 spin alignment recently observed by the Ludmila collaboration in $\bar{p}p$ collisions at 22.4 GeV/c is examined in the framework of a quark-parton recombination model. It is pointed out that this phenomenon can naturally be explained only in a version of the model with negligible parton transverse motion. The inclusion of primordial transverse momenta of partons leads to almost complete disappearance of the effect. Contrary to other characteristics (e.g. particle multiplicities, single particle inclusive spectra), which are more or less well described by the quark recombination model, the polarization of hadrons produced in high energy collisions is difficult to explain and will probably serve as a decisive test of the authors understanding of underlying dynamics. 105706 Limits to the number of neutrinos: a comment on the Z^0 discovery. F.Halzen, K.Mursula (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland).
Phys. Rev. Lett. (USA), vol.51, no.10, p.857-8 (5 Sept. 1983).
The observation of four *Z*s in a sample of events containing 32 charged *W*s improves terrestrial bounds on the number of neutrinos by roughly one order of magnitude. Also a bound on the production cross section of *Z*s relative to *W*s is obtained. These bounds do not depend on the determination of the *Z* width. (8 refs.)

14.80 OTHER AND HYPOTHETICAL PARTICLES

105707 Electrometer designs for use in an unbound-quark search. E.R.Williams (Electrical Measurements & Standard Div., NBS, Washington, DC, USA), G.T.Gillies.
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.15, p.520-4 (13 Aug. 1983).
An instrument capable of modulating a small capacitance is described. It is to be used as an electrometer in a search for stable fractionally charged particles in test masses of several grams each, the largest yet studied. The new approach uses Gauss's law to sense charge directly and does not require the measurement of small forces, as has been the case in most previous quark searches. Preliminary results from an unoptimized experiment are encouraging, showing sensitivities of a few $100e/\sqrt{H_z}$ at atmospheric pressures and without any special precautions. (11 refs.)

105708 Search for fractional charges in water. D.C.Joyce, P.C.Abrams, R.W.Bland, R.T.Johnson, M.A.Lindgren, M.H.Savage, M.H.Scholz, B.A.Young (Phys. & Astron. Dept., San Francisco State Univ., San Francisco, CA, USA), C.L.Hodges.
Phys. Rev. Lett. (USA), vol.51, no.9, p.731-4 (29 Aug. 1983).
Results are presented from a search for fractional charges in water from a variety of natural sources. About 30000 water drops have been measured, comprising 51 μg of water and dissolved materials. No evidence for fractional charge was seen. (11 refs.)

20.00 NUCLEAR PHYSICS

21.00 NUCLEAR STRUCTURE

21.10 GENERAL AND AVERAGE PROPERTIES OF NUCLEI; PROPERTIES OF NUCLEAR ENERGY LEVELS

(for properties of specific nuclei listed by mass ranges, see 27.)

105709 Retarded dissipation of the $Z=64$ shell gap in ${}_{66}{}^{160}Dy_{94}$. N.Ibrahim, N.M.Stewart (Bedford Coll., Univ. of London, London, England).
J. Phys. G (GB), vol.9, no.9, p.L195-8 (Sept. 1983).
The possible effect of the recently discovered subshell closure at $Z=64$ is investigated for ^{160}Dy. Energy levels and B(E2) ratios are compared with IBM-1 calculations assuming either a single $Z=50$-82 shell or subshell closure at $Z=64$. The latter calculation improves agreement with experiment. (10 refs.)

105710 On the relative quality of the spin expansion and frequency expansion for the description of rotational level energies. L.K.Peker, S.Pearlstein (Nat. Nuclear Data Center, Brookhaven Nat. Lab., Upton, NY, USA), J.H.Hamilton.
J. Phys. G (GB), vol.9, no.9, p.1025-32 (Sept. 1983).
The expansions $E_{rot}(I)=\Sigma_{i=1}{}^{n1}A_i[I(I+1)]^i$ and $E_{rot}(I)=\Sigma_{i=1}{}^{n2}\alpha_i\omega_1{}^{2i}$ that describe the energies of the levels in the ground-state rotational bands with $K^\pi=0^+$ are generally not equivalent unless $n_1=n_2=1$ or ∞. A method is proposed to characterise this non-equivalency quantitatively. It was found that in some nuclei, like ^{248}Cm and ^{176}Er, the $I(I+1)$ expansion is better than the ω^2 expansion, whereas in the majority of nuclei the ω^2 expansion is better. The data demonstrate that the rates of convergence of the $I(I+1)$ and ω^2 expansions for E_{rot} depend on the individual properties of the nuclei. (7 refs.)

105711 A semimicroscopic model of nuclear vibrations with separable forces and the giant dipole resonance of ^{12}C. V.N.Orlin (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.263-86 (29 Aug. 1983).
In the generalized ph basis generated for the realistic nuclear ground state, the nuclear hamiltonian is approximated by an expression containing the separable effective forces and terms which can be estimated from the spectroscopic data. The model hamiltonian obtained is used to describe normal nuclear vibrations. The application of this approach in the shell-model theory of nuclear reactions is discussed. The S-matrix for nucleon-nucleus scattering is calculated explicitly. The ^{12}C photodisintegration calculation is made as a test example. (33 refs.)

105712 Neutron and proton alignment at high spin in ^{168}W. G.D.Dracoulis, H.Hubel, A.P.Byrne, R.F.Davie (Dept. of Nuclear Phys., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.363-80 (29 Aug. 1983).
Excited states in the neutron-deficient nucleus ^{168}W, populated in the $^{148}Sm(^{24}Mg,4n)^{168}W$ reaction have been studied using γ-ray spectroscopy. The yrast band, which is identified up to about 28, shows a very strong backbend at low frequency $\hbar\omega_c=0.235$ MeV attributed to the $(i_{13/2})^2$ neutron alignment. Evidence for a second backbend is also observed. A strongly populated odd-spin (probably negative-parity) sideband is also indentified to the spin, and shows several band-crossing anomalies. The characterisation of the anomalies is made by comparison with CSM calculations. Proton and neutron alignments are probably present in the sideband, and the second backbend in the yrast sequence may be due to alignment of $i_{13/2}$ protons. (27 refs.)

105713 $(f_{7/2})_{7,0}{}^{-2}$ configuration high-spin states in ^{60}Co strongly excited in the $^{62}Ni(\vec{d},\alpha)$ reaction. H.Nann, W.W.Jacobs, A.D.Bacher, W.P.Jones, Li Qing-Li, E.J.Stephenson (Dept. of Phys., Indiana Univ., Bloomington, IN, USA).
Nucl. Phys. A (Netherlands), vol.A406, no.1, p.81-93 (12 Sept. 1983).
The $^{62}Ni(\vec{d},\alpha)^{60}Co$ reaction has been studied with 78 MeV vector polarized deuterons. Angular distribution of the differential cross section and vector analyzing power have been measured for strongly populated states in ^{60}Co up to an excitation energy of 5 MeV. The transferred orbital and total angular momenta L and J were determined from the characteristic shapes of the differential cross sections and vector analyzing powers yielding a number of new spin assignments. The $J^\pi=7^+$ stretched $[(^{62}Ni_{g.s})_{0+}\otimes(1f_{7/2})_{7,0}{}^{-2}]$ configuration was found to be distributed at least over nine states located at 1.51, 3.09, 3.46, 3.67, 3.78, 4.04, 4.55, 4.70 and 4.80 MeV. (13 refs.)

105714 Microscopic calculation of dynamical effects: the energy dependence of nucleon self-energies in ^{208}Pb. H.M.Sommermann (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany), K.F.Ratcliff, T.T.S.Kuo.
Nucl. Phys. A (Netherlands), vol.A406, no.1, p.109-33 (12 Sept. 1983).
Dynamical effects on the single-particle self-energy $\Sigma(\omega)$, i.e. its ω-dependence, are studied microscopically using realistic finite-range NN interactions (Reid soft-core reaction matrix). The self-energy $\Sigma(\omega)$ and corresponding effective mass $m^*(\omega)$ are evaluated for proton and neutron particles in ^{209}Bi and ^{209}Pb (first and second shell) and for proton and neutron holes in ^{207}Tl and ^{207}Pb. The authors calculate, furthermore, the self-consistent energies and related spectroscopic factors (Z). In heavy nuclei the coupling of particles to highly collective low-lying surface vibrations is found to cause dynamical effects much stronger than in nuclear matter. Consequently, the single-particle and single-hole energies which enter into the calculation of highly excited states are different from their experimental values. The correct inclusion of dynamical effects in the calculation of the giant dipole resonance is discussed. (31 refs.)

105715 Molecular alpha-particle clustering in ^{218}Ra; dipole collectivity in the vicinity of nuclear shell closures. M.Gai, J.F.Ennis, M.Ruscev, E.C.Schloemer, B.Shivakumar, S.M.Sterbenz, N.Tsoupas, D.A.Bromley (A.W. Wright Nuclear Structure Lab., Yale Univ., New Haven, CT, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.646-9 (22 Aug. 1983).
Evidence for the presence of alpha-particle clustering in ^{218}Ra comes from a number of observables: binding energy, S_{2n}, Q_α, $E_x(J^\pi)$, $\theta_\alpha{}^2$, and F_α. That this clustering is a signature for the new dipole collectivity suggested by Iachello and Jackson (1982, 1983) follows from observation of simultaneous enhancement of selected $E1$, $E2$, and $E3$ deexcitation transition matrix elements; of these the $E1$ enhancement is most pronounced as would be expected for dipole collectivity. (15 refs.)

105716 Rotational structure and Nilsson orbitals for highly deformed odd-A nuclei in the $A\sim100$ region. F.K.Wohn, J.C.Hill (USDOE, Iowa State Univ., Ames, IA, USA), R.F.Petry, H.Dejbakhsh, Z.Berant, R.L.Gill.
Phys. Rev. Lett. (USA), vol.51, no.10, p.873-6 (5 Sept. 1983).
Six rotational bands have been found in ${}_{39}{}^{99}Y_{60}$, ${}_{39}{}^{101}Y_{62}$, ${}_{38}{}^{99}Sr_{61}$, and ${}_{40}{}^{101}Zr_{61}$. All bands have small and very similar values of $\hbar^2/2\mathcal{I}$ that indicate deformations of $\sim$0.3-0.4 and imply that these nuclei are among the most deformed known, with $\mathcal{I}\sim0.8\mathcal{I}_{rigid}$. Relative strengths of intraband γ transitions suggest Nilsson orbital assignments of $\pi^5/_2[422]$ for the Y ground bands. (16 refs.)

105717 Transition charge and current densities of collective isoscalar quadrupole states in ^{208}Pb. H.Sagawa (Nat. Inst. for Nuclear Phys. & High-Energy Phys., Amsterdam, Netherlands), N.Van Giai.
Phys. Lett. B (Netherlands), vol.127B, no.6, p.393-8 (11 Aug. 1983).
Transition charge densities and current distributions of isoscalar quadrupole states in ^{2108}Pb are calculated in the self-consistent RPA model. The authors find clear differences between the low lying state and the giant resonance for transition charge densities as well as current distributions. The implications on the transverse form factors of electron scattering are discussed. (17 refs.)

105718 The moment of inertia of ^{130}Ce above spin $30\hbar$. P.J.Nolan, R.Aryaeinejad, A.H.Nelson, D.J.G.Love, D.M.Todd, P.J.Twin (Oliver Lodge Lab., Univ. of Liverpool, Liverpool, England).
Phys. Lett. B (Netherlands), vol.128B, no.5, p.285-9 (1 Sept. 1983).
The structure of ^{130}Ce has been investigated at high spin following the $^{100}Mo(^{34}S, 4n)^{130}Ce$ reaction. Evidence is seen near $\hbar\omega=0.6$ MeV for the alignment of $i_{13/2}$ neutrons which is predicted by the cranked shell model. Rotational structure extends up to $\hbar\omega=0.8$ MeV with a constant moment of inertia ($\mathcal{J}_{band}{}^{(2)}$), equal to the rigid body value above $\hbar\omega=0.6$ MeV. (11 refs.)

105719 The RPA calculation of bandhead energies in many-boson systems. J.Dukelsky, G.G.Dussel, R.P.J.Perazzo, H.M.Sofia (Dept. de Fisica, Comision Nacional de Energia Atomica, Buenos Aires, Argentina).
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.1-4 (15 Sept. 1983).
The RPA is used to correct the Hartree self-consistent single-boson energies. The spurious states that appear as a consequence of broken symmetries are set at zero energy and can therefore be eliminated. The method is exemplified with an SU_3 Hamiltonian with only s and d bosons. (15 refs.)

105720 Anharmonicities of gamma vibration in ^{168}Er. I.Hamamoto (Niels Bohr Inst., Copenhagen, Denmark).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.157-69 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
Properties of the γ-vibration in ^{168}Er are examined both in a macroscopic and in a microscopic approach with special emphasis on the anharmonicities of two-phonon states. It is found that in order to account for recent experimental evidence it is necessary to assume large anharmonic components both in the collective potential energy surface and in the mass parameters. Points which are not clear in the present understanding of the gamma-motion are described. (17 refs.)

105721 Excitation modes of the γ-band in ^{24}Mg through the $^{24}Mg(\vec{p},p')$ reaction. M.Sugitani, T.Hasegawa, S.Kubono, Y.Ishizaki (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan), K.Iwatani, T.Fujisawa, K.Yoshinada.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.250-4
The analyzing powers and differential cross sections have been measured for the ground rotational band and γ-band of ^{24}Mg through the $^{24}Mg(\vec{p},p')$ reaction at the incident energies of 29.3 and 40.4 MeV. The experimental cross sections and analyzing powers for the 3^+ state in the γ-band have been reproduced by a second-order DWBA calculation with an effective nucleon-nucleon interaction and with a shell model description to the nuclear structure of ^{24}Mg. The (p-d-p′) process gives a significant improvement both to the analyzing powers and to the cross sections to reproduce the experimental data. (7 refs.)

105722 Proton inelastic scattering by the even-Ge isotopes at $E_p=22$ MeV. P.Avignon, L.H.Rosier, R.Tamisier, B.Ramstein (Inst. de Phys., Nantes, France), J.P.Delaroche.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.255-9
Even-Ge(p,p′) inelastic scattering has been studied at 22 MeV with an overall energy resolution of 10 keV using a tandem Van de Graaff and a split pole magnetic spectrometer. Angular distributions have been obtained for about 40 levels in each isotope. DWBA, vibrational and asymmetric rotor model CC calculations have been made. Spin and parity assignments have been deduced. Possible unnatural parity levels have been populated. (8 refs.)

105723 Sum-rule strengths of low-lying 4^+ levels in $^{74-82}$Se nuclei. K.Ogino, Y.Kadota, K.Haga (Dept. of Nuclear Engng., Kyoto Univ., Kyoto, Japan), S.Matsuki, T.Higo, T.Shiba, N.Sakamoto, T.Yanabu.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.260-4
The low-lying spectra of the even $^{74-82}$Se nuclei up to $E_x=5.0$ MeV were investigated with inelastic proton scattering at $E_p=64.8$ MeV. Several 4^+ states in ^{74,78,80,82}Se were found at $2.0<E_x<5.0$ MeV, while in ^{76}Se more than ten states were observed in the same energy region. The energy weighted sum rule fraction of the 4^+ states increases with decreasing neutron number from ^{82}Se (1.0%) up to ^{76}Se (3.7%), and then decreases. A self-consistent

RPA calculation reproduces the excitation energies and transition strengths of the 4^+ states observed in the present experiment. (12 refs.)

105724 Excitation of low-lying collective bands in inelastic hadron scattering. M.N.Harakeh (Nuclear Phys. Lab., Univ. of Washington, Seattle, WA, USA).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.446-67
Considers the excitation of β- and octupole bands in permanently deformed nuclei in the framework of the coupled channel method. Transition densities for the β- and octupole bands derived from the ground state density and satisfying, respectively, the conditions of particle conservation and translational invariance, are presented. Transition potentials derived from optical model potentials along similar lines are used in the coupled channel analysis of inelastic hadron scattering from β- and octupole bands in deformed nuclei. The coupling of giant resonance modes into these low-lying bands manifesting themselves in additional terms to the transition densities is discussed. (32 refs.)

105725 Probing the nuclear structure with heavy-ion reactions. R.A.Broglia (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.107-58
Nuclei display distortions in both ordinary space and in gauge space. It is suggested that it is possible to learn about the spatial distribution of the Nilsson orbitals and about the change of the pairing gap with the rotational frequency through the analysis of one- and two-nucleon transfer reactions induced in heavy-ion collisions. (27 refs.)

105726 Description of high spin states. A.Faessler (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.267-86
Three points are discussed: (i) The nature of the second backbending (bb) in the rare earth nuclei will be theoretically investigated. It will be confirmed that 2. bb is due to the alignment of a $h_{11/2}$-proton pair. The oscillating behaviour of the 2. bb can explain the variation of the second anomaly in the $N=90$ isotones. Strong variations of the 2. bb with the neutron number can be explained by the change of the deformation β. (ii) The smooth increase of the moment of inertia in the actinide nuclei is explained mainly by the alignment of a $i_{13/2}$ proton pair. This is confirmed by measurements of the g-factors and the blocking effect in odd proton nuclei where the odd proton is in a $i_{13/2}$ level. In ^{248}Cm, where one has a smaller deformation, one finds a roughly equal role for $i_{13/2}$ and $j_{15/2}$ neutrons for the increase of the moment of inertia. (iii) In this third part high spin spectra are studied in the even mass Hg-isotopes by coupling two quasi-particles to an interacting boson core. This calculation can reproduce the anomalous behaviour of the yrast states around angular momentum 8, 10 and 12. (41 refs.)

105727 New directions in studies of nuclei far from stability with heavy ions. J.H.Hamilton (Phys. Dept., Vanderbilt Univ., Nashville, TN, USA).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.300-10
Many techniques are being employed to study nuclei far from stability. Here the author concentrates on some highlights in the use of heavy ions to probe nuclei far from stability. In addition to probing nuclei far from stability along lines of count Z or N, nuclei at very high angular momenta are another important area of research far from the stable ground states. The author looks at some new directions being opened up by heavy ions, some of the new facilities and then some interesting new results. (29 refs.)

105728 Multiple discontinuities of the moment of inertia at high spin. J.H.Hamilton (Phys. Dept., Vanderbilt Univ., Nashville, TN, USA).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.311-16
What happens to a nucleus at high spins is one of the major fields of nuclear structure today as evidenced by the several recent international conferences in this field. The author concentrates on two new approaches to study high spin states-partial fusion reactions and neutron multiplicity experiments. The latter has been used to study states to a record high spin for a light nucleus, tentatively 20^+ in ^{74}Kr. The former has been employed to observe third and higher discontinuities of $\mathcal{J}$ in ^{158}Er. (14 refs.)

105729 Recent results on nuclei far from stability in the mass region $A \simeq 70$. A.V.Ramayya (Phys. Dept., Vanderbilt Univ., Nashville, TN, USA), J.Eberth.
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.317-26
Recent advances in experimental techniques, of in-beam γ spectroscopy for the detection of γ rays from evaporation residues induced by heavier ions, have made possible to investigate the level structures of nuclei far from stability. The nuclei in the mass region $A \simeq 70$ are very interesting because they exhibit wide variety of band structure and are also transitional nuclei. The authors discuss some of the advances made in in-beam gamma-ray spectroscopy techniques and the results obtained in this mass region. Also, they discuss briefly the present understanding of these results. (16 refs.)

21.10D Binding energy and masses

105730 Are heavy-ion entropy production and nuclear level density discrepancies related?. C.S.Warke, M.Uhlig, W.Greiner (Inst. fur Theoretische Phys., Johann Wolfgang Goethe-Univ., Frankfurt/Main, Germany).
J. Phys. G (GB), vol.9, no.9, p.1083-102 (Sept. 1983).
The thermodynamic properties of a system of Dirac particles interacting through classical fields are studied within the interaction models proposed recently. The theoretical formalism is based on the variational ansatz of the Gibbs free energy. The binding energy per nucleon, pressure and specific entropy are calculated from the low-temperature expansion in the range of densities and temperatures of interest to heavy-ion reactions. The calculated value of specific entropy produced in heavy-ion collisions is found to be much less than that obtained from the measured value of the deuteron to proton ratio. The model of Boguta and Bodmer (1977) predicts larger values of the specific entropy as compared with those of the Walecka model. It is pointed out that the difficulty of understanding the nuclear level density data may be related to that of the entropy production in heavy-ion reactions. A relativistic generalisation of Bethe's level density parameter and the average thermal energy, useful in hydrodynamic calculations, are derived. (27 refs.)

105731 Ground state properties of actinide nuclei. D.Galeriu (Inst. of Phys. & Nuclear Engng., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.6, p.477-87 (1983).
The ground state properties of actinide nuclei—mass excess, deformation, level scheme, level density—are computed by the macroscopic-microscopic method. The nuclear potential includes nonspheroidal deformation and the macroscopic energy is given by the Yakawa plus exponential model. The mass excess is reproduced with an r.m.s. of 0.67 MeV while the level density at the neutron binding energy is within a factor of two in accordance with experimental data, without free parameters. The level density is computed with a microscopic intrinsic level density and collective enhancement. Improvements for lighter actinide are suggested. (32 refs.)

21.10F Shape, charge, radius and form factors

105732 Different treatments of pairing correlations for nuclear shapes at high spin. M.Faber, A.Faessler, H.Markum (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany).
J. Phys. G (GB), vol.9, no.9, p.1069-82 (Sept. 1983).
Strutinsky calculations are used to investigate the shape and fission stability of rotating nuclei. A cranked Woods-Saxon single-particle Hamiltonian is provided to describe triaxial and dumb-bell shapes. Since the cranking term violates time-reversal symmetry the convenient BCS method cannot be applied. On the other hand, the consideration of pairing by the solution of HFB equations is possible for a few selected nuclei only. As demonstrated recently, pairing influences the shape of fission barriers up to very high angular momenta and should not be neglected. Thus, modifications of the BCS equations are desirable. Such methods are discussed and their results are compared with the HFB results. (23 refs.)

105733 Deformation changes along the yrast line in ^{160}Yb. R.Bengtsson (NORDITA, Copenhagen, Denmark), Yong-Shou Chen, Jing-Ye Zhang, S.Aberg.
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.221-36 (29 Aug. 1983).
The yrast states of ^{160}Yb are calculated using the cranked HFB model with particle-number projection and assuming diabatic bands. The energy of each state is minimized with respect to the proton and neutron pairing gap parameters and the deformation parameters ϵ and γ. The deformation of the ground band is found to increase with increasing spin, i.e. ϵ gets larger. Simultaneously γ gets slightly negative. In the s-band the dominating deformation change is an increase of γ with increasing spin. The calculated deformation changes are in qualitative agreement with recently measured transition quadrupole moments. Moments of inertia and energies are compared to measured quantities. (23 refs.)

105734 Equilibrium deformations for the Ra-Th region of nuclei. P.Rozmej, B.Nerlo-Pomorska, K.Pomorski (Maria Curie-Sklodowska Univ., Lublin, Poland).
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.252-62 (29 Aug. 1983).
New parameters of the single particle Nilsson potential for the Ra-Th region have been found. They are $\kappa_p=0.0561$, $\mu_p=0.702$, $\kappa_n=0.0588$, $\mu_n=0.442$. The fit is made to the experimental single-particle energy levels in the new quadrupole and hexadecapole equilibrium deformation points, obtained by the shell-correction method with a simple consistency condition. The equilibrium deformations calculated by this method are in good agreement with the experimental data. Experimental values of the quadrupole moments of ^{222}Rn, ^{222}Ra and ^{224}Ra are reproduced for the first time within the Nilsson-plus-Strutinsky method. (28 refs.)

105735 Properties of the three-nucleon bound states with virtual Δ-isobar excitation. C.Hajduk, P.U.Sauer, W.Strueve (Inst. fur Theoretical Phys., Univ. of Hannover, Hannover, Germany).
Nucl. Phys. A (Netherlands), vol.A405, no.3, p.581-604 (5 Sept. 1983).
Wave function components containing a single Δ-isobar are included in the calculation of the three-nucleon bound states. Multiple Δ-effects are ignored. The two-nucleon interaction acts in all partial waves up to total angular momentum $I=2$. The presence of a Δ-isobar increases the three-nucleon binding energy by about 0.3 MeV, 0.6 MeV repulsion being dispersive two-body effect, and 0.9 MeV attraction arising from the three-nucleon force with an intermediate Δ-isobar. The effect of the Δ on the three-nucleon charge and magnetic form factors and on the weak decay is investigated. (36 refs.)

105736 Study of isotope shifts, isotone shifts and nuclear compressibility from the analysis of muonic X-ray transitions. K.V.Subba Rao, A.A.Kamal (Phys. Dept., Osmania Univ., Hyderabad, India).
Pramana (India), vol.20, no.5, p.363-73 (May 1983).
Muonic X-ray transitions in various spherical nuclei in the region $13 \leq Z \leq 83$ have been analysed and the isotope and isotope shifts in charge radius R are investigated. Assuming $R=r_0A^{1/3}$, the isotopic and isotonic behaviour of the parameter r_0 is also studied. The variation of r_0 with mass number A reveals the variation of average nucleon density, which in turn sheds light on the compressibility of nuclear matter. The isotope and isotone shifts in R exhibit the shell effects in the vicinity of magic neutron and proton numbers: 20, 28, 50, 82 and 126. The results indicate that neutron-proton interaction is maximum at the beginning of a major neutron shell and decreases gradually as the shell gets filled up. The behaviour of parameter r_0 clearly suggests that low-Z nuclei are highly compressible while high-Z nuclei are more or less imcompressible. The parameter r_0 too is observed to exhibit profound shell effects. (5 refs.)

105737 Nuclear charge and matter distributions. P.E.Hodgson (Nuclear Phys. Lab., Univ. of Oxford, Oxford, England).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.70-96
Discusses the analysis of electron and proton scattering to give nuclear charge distributions, and then enlarges the analysis to include nuclear matter distributions. Other topics described include self-consistent calculations and nucleon orbit radii. (43 refs.)

105738 What do we learn from self-consistent models about nuclear density distributions?. F.Tondeur (Univ. Libre de Bruxelles, Brussels, Belgium).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.97-106
The detailed knowledge of nuclear density distributions is of great interest in several models of heavy ion collisions. Experiment has reached a very good precision in determining the shape of the charge densities in nuclei, even for far-unstable nuclei. However, only few accurate data have been obtained till now about neutron and matter distributions. Nuclear density distributions can be described by several characteristic quantities, like their RMS radii. Higher moments can also be used to give a detailed description of the density ρ ($\bar{r}$), but it is often more convenient to use the quantities ρ_c, $R_{1/2}$ and t, which are the central density, the half-density radius and the 90%-10% surface thickness, although they can often only be defined approximately. The author also examines the surface asymmetry, defined as the difference between the inner part of the surface thickness (inside $R_{1/2}$) and the outer part (outside $R_{1/2}$). (22 refs.)

105739 Shape coexistence and a new region of strong deformation in nuclei far from stability. J.H.Hamilton (Phys. Dept., Vanderbilt Univ., Nashville, TN, USA).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.287-99
Describes the discovery of super deformation in the region of Z and N both at or near 38. Simultaneously, Moller and Nix (1982) carried out calculations that predicted that nuclei in this region of $N \approx Z \approx 38$ should have the strongest ground state deformation of any nuclei with $\beta \approx 0.4$. New studies in the Sr nuclei support this conclusion. Indeed, it has been found experimentally and now predicted theoretically a new region of super deformation. The understanding of the origin of this deformation gives insights into nuclear shape coexistence in a wide range of different masses. (42 refs.)

21.10K Electromagnetic moments

105740 The nuclear magnetic moment of ^{190}Ir and the directional distribution of gamma rays in ^{190}Os. A.L.Allsop, S.Hornung (Clarendon Lab., Oxford, England), D.W.Murray, N.J.Stone.
J. Phys. G (GB), vol.9, no.9, p.1125-38 (Sept. 1983).
Angular distributions of gamma transitions between the levels in ^{190}Os fed in the decay of ^{190}Ir aligned in a rhenium single crystal have been measured at temperatures down to 2 mK. Multipole mixing ratios in both gamma and electron-capture transitions are deduced and compared with various nuclear models. The angular distribution coefficients are applied to interpret very small anisotropies observed when ^{190}Ir is polarised in an iron host matrix, cooled to 2.5 mK. The deduced magnetic dipole moment of the 4^+ ground state of ^{190}Ir is $|\mu(^{190}\mathrm{Ir};\ \mathrm{GS})|=0.04(1)\mu_N$. Possible single-particle descriptions compatible with this result are suggested. (27 refs.)

105741 Exchange-current contributions to the ^{3}He magnetic properties. W.Strueve, C.Hajduk, P.U.Sauer (Inst. for Theoretical Phys., Univ. of Hannover, Hannover, Germany).
Nucl. Phys. A (Netherlands), vol.A405, no.3, p.620-6 (5 Sept. 1983).
The ^{3}He magnetic moment and form factor are calculated with momentum space wave functions of the three-nucleon ground state based on the Paris and Reid soft-core potentials. The exchange-current contributions arising from π- and ρ-exchange and from virtual Δ-excitation are included. They explain only part of the difference between the theoretical one-body prediction and the available experimental data. (17 refs.)

105742 Strong effect of the sign of the hexadecapole moment on the polarized-proton inelastic scattering to the $4_1{}^+$ states in the even $^{74\text{-}82}$Se. S.Matsuki, T.Higo, T.Ohsawa, T.Shiba, T.Yanabu (Cyclotron Lab., Inst. for Chem. Res., Kyoto Univ., Kyoto, Japan), K.Ogino, Y.Kadota, K.Haga, N.Sakamoto, K.Kume, M.Matoba.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.265-9
Ground-band states up to the 4^+ in $^{74\text{-}82}$Se were studied with inelastic scattering of polarized protons at 65 MeV. Both the cross section angular distributions $\sigma(\theta)$ and analyzing powers A(θ) leading to the 4^+ states in the light ^{74,76,78}Se show quite different shapes from those in the heavy ^{80,82}Se. Coupled-channels calculations show that the symmetric rotational model and the second-order harmonic vibrational model with one-and two-phonon mixing in the 4^+ states describe equally well the whole distributions of $\sigma(\theta)$ and A(θ) and both give consistent values of β_4, positive for the light ^{74,76,78}Se and negative for the heavy ^{80,82}Se, indicating strong sensitivity of the A(θ) to the sign of the hexadecapole moment and a static or dynamic hexadecapole-shape transition between ^{78}Se and ^{80}Se. 105743 Excitations of the states of ^{107,109}Cd from the $(p,n\gamma)$ reaction on silver isotopes. M.B.Chatterjee, B.B.Baliga, R.Bhattacharya (Saha Inst. of Nuclear Phys., Calcutta, India).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.9, p.990-1001 (1983).
The states in ^{107,109}Cd nuclei were excited in the $(p,n\gamma)$ reaction on natural silver in the subcoulomb energy region. Eighteen excited states in ^{107}Cd and thirteen excited states in ^{109}Cd were studied by the gamma-ray singles and gamma-gamma coincidence measurement. Most of the low-lying states observed earlier in decay studies and transfer reactions are excited in the $(p,n\gamma)$ reaction. The excitation cross-sections of the individual states have been measured. The measured excitation cross-sections of these states relative to the well-known $7/2_1^+$ states of ^{107}Cd and ^{109}Cd are compared with the theoretically calculated values from the Hauser-Feshbach formalism based on compound nuclear statistical theory. (19 refs.)

105744 Energy levels in ^{93}Mo populated by the ^{93}Nb$(p,n\gamma)$ reaction. S.Mitarai (Dept. of Phys., Faculty of Sci., Kyushu Univ., Fukuoka, Japan), E.Minehara.
Nucl. Phys. A (Netherlands), vol.A406, no.1, p.55-80 (12 Sept. 1983).
Energy levels of ^{93}Mo have been investigated by means of the ^{93}Nb$(p,n\gamma)^{93}$Mo reaction. The excitation functions of the level de-excitation γ-rays were measured with a Ge(Li) detector under proton bombardment in the energy range 3.0 to 5.0 MeV. A detailed γ-ray decay scheme which includes 69 levels and 123 γ-ray lines was constructed from the threshold energies for 64 γ-rays and the γ-ray excitation functions around five isobaric analogue resonances in the ^{93}Nb$(p,n\gamma)$ reaction. Spin-parity values for 59 levels and favourable values for 8 levels were assigned from the analysis of relative neutron yields via the isobaric analogue resonances of the parent odd-odd nucleus ^{94}Nb. The results of the present experiment are compared with shell-model calculations. (23 refs.)

105745 The four-nucleon problem with local realistic NN interactions. J.L.Ballot (Div. de Phys. Theorique, Inst. de Phys. Nucleaire, Orsay, France).
Phys. Lett. B (Netherlands), vol.127B, no.6, p.399-402 (11 Aug. 1983).
The ground state and the first excited 0^+ state binding energies of ^{4}He are calculated within the framework of the hyperspherical method for the Gony-Pires-de Tourreil potential (GPDT) and for the two super soft core potentials (SSC.B and SSC.C) constructed by de Tourrteil and Sprung (1973). With neglect of the Coulomb effect, the ground state energies are found to be -30.10 MeV for GPDT, -25.88 MeV for SSC.B and -21.19 MeV for SSC.C. For the two first potentials an excited 0^+ state is found. The location of this state above the ground state is found to be 25.66 MeV for GPDT and 25.11 MeV for SSC.B. The author analyses the convergence of the ground state eigenvalues versus the grand orbital ($L=2K$) in comparing the results of the coupled equation calculations (CE) with those of different approximations, giving a lower bound with the extreme adiabatic approximation (EAA), an upper bound with the uncoupled adiabatic approximation (UAA) and an accurate bound with the coupled adiabatic approximation (CAA). (21 refs.)

105746 Effective mass in nuclei and the level density parameter. M.Prakash, J.Wambach, Z.Y.Ma (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.141-6 (25 Aug. 1983).
The influence of momentum and frequency dependence of the nuclear mean field Σ on the level density parameter a is studied. By introducing a local quasiparticle effective mass the authors determine the volume, surface and curvature coefficients of a, expressed as $a=a_vA+a_sA^{2/3}+a_cA^{1/3}$. It is found that the magnitude of a_c is significant due to the very nature of the surface. A purely momentum dependent field Σ determined from the nonlocality of the optical potential gives a level density close to a self-consistent Thomas-Fermi description with Skyrme III forces. An explicit frequency dependence of Σ mainly influences a_s, enhancing it considerably for medium and heavy nuclei. (12 refs.)

105747 Overlapping β decay and resonance neutron spectroscopy of levels in ^{87}Kr. S.Raman, B.Fogelberg, J.A.Harvey, R.L.Macklin, P.H.Stelson (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), A.Schroder, K.-L.Kratz.
Phys. Rev. C (USA), vol.28, no.2, p.602-22 (Aug. 1983).
Energy levels in ^{87}Kr have been studied, with special emphasis on the unbound region, using two different methods. The first method comprises neutron capture and transmission measurements on an enriched gas target of ^{86}Kr using neutron time-of-flight techniques. In this way, neutron widths were determined for 39 resonances below 400 keV and capture areas for 14 resonances below 90 keV. The second method is a decay study of 56-s ^{87}Br in which a level scheme for ^{87}Kr has been established that shows 126 levels in the bound and 12 levels in the unbound region. A detailed comparison amongst the neutron resonance, the γ-ray decay, and available delayed neutron results has been made. Almost a one-to-one correspondence exists between the currently observed p-wave resonances below 250 keV and levels in ^{87}Kr studies through delayed neutron emission. The overal β-strength distribution derived from the present data shows broad resonancelike structures. However, no marked selectivity is observed in the β decay to individual levels in the unbound region of ^{87}Kr. The neutron capture cross section of ^{86}Kr is found to be about 5 mb for 30-keV neutrons with a Maxwellian energy distribution. The future of delayed neutron spectroscopy as a new tool for obtaining level-density information is discussed. (44 refs.)

105748 Nuclear level density at high excitation energies. M.Ohta, K.Hatogai, S.Okai (Dept. of Phys., Konan Univ., Kobe, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.756-60
The angular momentum dependent nuclear level density, effective at high excitation energies, is calculated by means of the partition function method with the shell model single particle state. The active size of the single particle level space for the calculation is determined in connection with the data of heavy-ion fusion reactions at high incident energies. (14 refs.)

21.30 NUCLEAR FORCES

(see also 13.75C Nucleon-nucleon interactions)

105749 The deuteron asymptotic D-state as a probe of the nucleon-nucleon force. T.E.O.Ericson (CERN, Geneva, Switzerland), M.Rosa-Clot.
Nucl. Phys. A (Netherlands), vol.A405, no.3, p.497-435 (5 Sept. 1983).
A critical discussion is given of the various contributions to the asymptotic D/S ratio from the πNN interaction. Particular emphasis is laid on the analysis of contributions from 2π exchange, the dependence on the πNN form factor, and on the πN coupling constant, so as to assess quantitatively the model dependence of the result. From this analysis, significant restrictions are deduced on the shape of the πNN form factor and, in quark bag models the value of the quark bag radius. The results of previous theoretical approaches for the D/S ratio and quadrupole moment are shown to obey a universal and linear relation, when expressed in reduced units so as to compensate for small differences in effective range and πN coupling constant. The quadrupole moment is also quantitatively analyzed in detail. Its value is proved to be an accurate and almost model-independent consequence of the experimental D/S ratio (apart from relativistic and meson-exchange corrections) in agreement with observations. In the comparison with experiments, a critical survey of the relevant experimental data is given. In particular, a considerably improved value for the quadrupole moment is deduced. (45 refs.)

105750 The screening of the particle-hole interaction to all orders. W.H.Dickhoff, A.Faessler, H.Muther, Shi-Shu Wu (Inst. fur Theoretische Phys., Tubingen, Germany).
Nucl. Phys. A (Netherlands), vol.A405, no.3, p.534-56 (5 Sept. 1983).
Starting from Brueckner's G-matrix the effects of the induced interactions on the particle-hole interaction in nuclear matter are investigated to all orders. Although an interactive solution of the non-linear integral equations, which have to be solved, leads to divergent contributions, it can be shown that the renormalization effects summed to all orders are finite. The complete momentum dependence of the particle-hole interaction is treated which in the Landau limit results is less attractive F_0 and more repulsive G_0' parameters. For finite ph momenta these features are maintained implying that the collectivity in the pion spin-isospin channel is screened also when the renormalization is considered to all orders. (20 refs.)

105751 Validity of approximate treatments of Δ-isobar degrees of freedom. C.Hajduk, P.U.Sauer (Inst. fur Theoretical Phys., Univ. of Hannover, Hannover, Germany), Shin Nan Yang.
Nucl. Phys. A (Netherlands), vol.A405, no.3, p.605-19 (5 Sept. 1983).
A perturbative approach to Δ-isobar components of the three-nucleon ground-state wave function is developed. It is based on the transition potential connecting nucleon-nucleon partial waves and partial waves with isobars. The perturbative results with single Δ-isobar excitation are compared to those of an exact coupled-channel calculation and turn out to be satisfactory agreement for many Δ-effects. Within the perturbative method the role of the ρ-exchange in the transition potential and the importance of double Δ-excitations in the three-nucleon ground state are discussed. Effective nuclear operators such as three-nucleon forces and exchange currents, when simulating Δ-propagation in static approximation, are found to grossly overestimate Δ-effects. (25 refs.)

105752 Nuclear effective interactions and spin excitations. T.Kohmura (Nuclear Phys. Lab., Oxford Univ., Oxford, England).
Nucl. Phys. A (Netherlands), vol.A405, no.3, p.653-70 (5 Sept. 1983).
In view of the one-boson-exchange model for the nucleon-nucleon interaction and the Hartree-Fock (HF) interaction, the author formulates the effective interactions for particle-hole states in terms of the exchange of the fields which are confined in the nucleus. This theory, as an extension to the nuclear field theory (NFT), takes into account the propagation of the fields which is neglected in NFT. The effective interactions thus obtained reproduce the energies of a sequence of electric giant resonances and the core polarizabilities associated with the resonances. It is found that the coupling constants of the σ- and ω-fields are suppressed for the particle-hole interaction by 60% with respect to the HF interaction. As for the effective interactions involving nucleon spins, he considers the fields coupled to nucleon spins. The effective interactions obtained, essentially different from those in NFT, have a tensor component. The author analyses the energies and cross sections for excitation of stretched spin particle-hole states which are the most sensitive to the tensor force. The effective interaction responsible for the stretched spin states is shown to be consistent with that for the magnetic resonances observed in the (p,n) reactions. (28 refs.)

105753 Calculations of pion excess in nuclei. B.L.Friman, V.R.Pandharipande (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), R.B.Wiringa.
Phys. Rev. Lett. (USA), vol.51, no.9, p.763-6 (29 Aug. 1983).
The authors construct, in the static potential approximation, the number operator for excess pions present in nuclei due to the pion-exchange forces between nucleons. Expectation values are calculated with use of variational wave functions obtained from a realistic Hamiltonian. Results are presented for systems ranging from the deuteron to nuclear matter: For example ^{56}Fe is estimated to have $\sim$7 extra pions, over and above the pion clouds associated with the individual nucleons. (14 refs.)

105754 Spin-dependent excitations: RPA model and isobar-hole couplings. H.Sagawa (Nat. Inst. for Nuclear Phys. & High Energy Phys., Amsterdam, Netherlands).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.342-56 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
Spin properties of Skyrme-type interactions are discussed in comparison with the renormalized G-matrix. Using the modified Skyrme interaction SGII, spin-dependent excitations are studied in the framework of RPA model taking

into account the isobar-hole couplings. Combined effects of RPA correlations and Δ-h coupling give about 35% reductions of Gamow-Teller and $M1$ transition strengths. The quenching of spin-dipole ($\sigma r Y_1$) excitations is shown to be less than that of the σ-τ modes. (24 refs.)

105755 The residual interaction of bound nucleons—two-nucleon matrix elements deduced from transfer experiments. W.W.Daehnick (Nuclear Phys. Lab., Univ. of Pittsburgh, Pittsburgh, PA, USA).
Phys. Rep. (Netherlands), vol.96, no.6, p.317-91 (July 1983).
Matrix elements for the effective two-nucleon interaction have been deduced from the population of multiplets near closed shells as observed in direct transfer reactions. In the evaluation, the limited purity of such multiplets was taken into consideration, typically by weighting the observed fractions of the two-nucleon configurations by their spectroscopic strengths and by using the resulting energy centroids. In a few cases, off-diagonal matrix elements are available from empirical wave functions. The systematic errors for particle-particle matrix elements extracted directly and those obtained from Pandya transformations were found to go in opposite directions. In some cases, this feature of the empirical method could be used to suggest upper and lower 'bounds' for the extracted matrix elements. Diagonal matrix elements for the empirical residual interaction show a number of features suggestive of an underlying simplicity in the interaction of bound nucleons. Within experimental uncertainties (of about 10% for $T=0$ matrix elements) the monopole parts of the matrix elements are fit well with a simple $A^{-0.75}$ dependence, and the data available to date do not reveal any significant monopole dependence on the quantum numbers of the interacting nucleons. The usefulness of scaling is suggested. Generally, diagonal matrix elements $E_J(j_1j_2)$ normalized by the extracted A-dependent monopole strength agree within expected experimental uncertainties whether derived from particle-particle or particle-hole multiplets and whether extracted from the beginning or the end of a major shell. (157 refs.)

105756 Calculation of effective interactions. F.Brieva (Dept. de Fisica, Univ. de Chile, Santiago, Chile).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.4-11
The role of the true non-local effective force is not well understood. Since the problem is technical in a great deal the author discusses a general method to calculate the t-matrix elements either in the coordinate or momentum-space representation. The method is independent on whether the internucleon force has a hard core or not. This is a considerable advantage over existent approaches since one can compare directly the results obtained from different nucleon-nucleon forces. (18 refs.)

105757 Pairing correlations at high spin and finite temperature: a modified BCS approach. O.Civitarese, A.Plastino, A.Faessler (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany).
J. Phys. G (GB), vol.9, no.9, p.1063-8 (Sept. 1983).
The modified BCS approach for rotating nuclei is extended in order to include thermal excitations. The formalism is developed to take into account both high-spin and temperature-dependent effects. The method seems to be appropriate for the microscopic description of the pairing correlations at excitation energies above the yrast line. (20 refs.)

21.60C Shell model

105758 A graphical method to evaluate vacuum expectation values of products of creation and annihilation operators. P.P.Delsanto (Dept. of Phys., Duke Univ., Durham, NC, USA).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.15, p.513-19 (13 Aug. 1983).
A graphical method for the evaluation of vacuum expectation values of products of creation and annihilation operators, is presented. This method is an adaptation of Danos' switchyard technique (1971) to the particular case of strings of only creation and annihilation operators and is easier to use and more transparent than Wick's theorem. (3 refs.)

105759 The nuclear field theory. D.R.Bes (Phys. Dept., Comision Nacional de Energia Atomica, Buenos Aires, Argentina).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.1-32 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
The nuclear field theory (NFT) is presented with particular emphasis on its foundations. The following points are discussed: i) the equivalence between pure fermion and NFT operators (including the Hamiltonian), ii) the results from an exactly soluble example, iii) the appropriate expansion parameter and the convergence of the corresponding perturbation series, and iv) the extension to deformed systems. This is accomplished through the derivation of both the deformed Hamiltonian (superfluid case) and of the perturbation treatment appropriate for deformed basis. (47 refs.)

21.60E Collective models

105760 On the theory of collective motion in nuclei. III. From Hamiltonian dynamics to vortex-free fluidity. P.Kramer, Z.Papadopolos, W.Schweizer (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany).
Ann. Phys. (USA), vol.149, no.1, p.44-57 (Aug. 1983).
For pt.II see ibid., vol.141, no.2, p.269-82 (1983). It is assumed that the Hamiltonian for collective motion in nuclei is invariant under the orthogonal group $O(n,\mathbf{R})$. For degenerate orbits in phase space it is shown that the classical Hamiltonian equations reduce to the equations of a vortex-free fluid with a velocity field determined by independent equations of motion. (18 refs.)

105761 *SU* (3) and *SU* (5) dynamical symmetries in the extended interacting boson model. Sun Hong Zhou, M.Moshinsky (Inst. de Fisica, Univ. Nacionale Autonoma de Mexico, Mexico City, Mexico), A.Frank, P.Van Isacker.
KINAM Rev. Fis. (Mexico), vol.5, no.2, p.135-62 (1983).
The authors study two possible dynamical symmetries in the extended interacting boson model where g ($L=4$) bosons are allowed besides the usual s-d bosons of the IBM. The first of these symmetries [$SU(3)$] was proposed recently and in this paper they present a thorough discussion of its mathematical properties. The second symmetry [$SU(5)$] is new. They discuss the properties of both limits concerning generators, Casimir operators, energy spectra, reduction rules, wave functions and, to some extent, electromagnetic transitions. (27 refs.)

105762 Boson-fermion expansions. E.R.Marshalek (Dept,. of Phys., Univ. of Notre Dame, Notre Dame, IA, USA).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.89-114 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
The boson expansion theory is extended so as to allow for the coupling of several fermion-like valence particles or holes to the collective vibrations of a closed shell, described in terms of boson degrees of freedom. The result is a faithful mapping of the original many-fermion problem into a certain boson-fermion subspace without redundant variables. Generalizations of the Dyson and Holstein-Primakoff representations are derived with the aid of algebraic techniques. (22 refs.)

105763 A theory for coupling between fundamental excitation modes in nuclei. T.Kishimoto (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan), T.Tamura, T.Kammuri.
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.170-83 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
A theory to describe coupling between fundamental excitation modes in nuclei is presented. It is characterized by two important aspects. First, a technique called dynamical nuclear field theory is developed, which is not only capable of constructing fundamental excitation modes but also of deriving and solving the effects of the coupling between these modes. Secondly, the derivation of effective nuclear interactions is improved so that they can be used for the microscopic description of the above coupling. (8 refs.)

105764 Rocky paths, dead ends and smooth paths towards a theory of nuclear collective motion. F.M.H.Villars (Dept. of Phys., MIT, Cambridge, MA, USA).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.184-97 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
Summarizes the well known construction based on TDHF of a collective Hamiltonian $\mathcal{H}(p,q)$ from an A-particle Hamiltonian $\hat{H}$. This construction is stated as a prescription, that may also be applied to any one particle operator $\hat{Y}$, and its time derivative $[i\hat{H},\hat{Y}]$. The operators $\mathcal{Y}(p,q)$ and $\mathcal{Y}(p,q)$ so obtained are required to obey $\mathcal{Y}(p,q)=[i\mathcal{H}(p,q), \mathfrak{Y}(p,q)]$. It is shown that this consistency condition on collective dynamics can indeed be enforced, and leads to the same conditions as the TDHF-variational principle. The author presents an alternative to TDHF, which is quantum mechanical from the outset. Eigenfunctions of the collective 'position' operator $\hat{Q}$ are constructed by projection. In the adiabatic limit, the results obtained by variationally optimizing the trial function for the system are in substantial agreement with quantized TDHF. Zero-point energy corrections are automatically included. (14 refs.)

105765 Dynamic deformation model of nuclear collective motions. K.Kumar (Phys. Dept., Tennessee Technol. Univ., Cookeville, TN, USA).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.198-208 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
The main concept and the five main steps of the dynamic deformation model are discussed. References are given for the formalism of the model, and for the results discussed previously. A brief comparison with the other approaches is given. (42 refs.)

105766 An attempt toward quantum theory of 'maximally-decoupled' collective motion. T.Marumori (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan), F.Sakata, T.Une, Y.Hashimoto.
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.221-36 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
A full quantum theory of 'maximally-decoupled' collective motion is proposed. The essential idea is to develop a quantum theory which is capable by itself of determining a 'maximally-decoupled' collective subspace as well as a 'maximally-decoupled' collective Hamiltonian on the basis of a fundamental principle called the invariance principle of the Schrodinger equation. (14 refs.)

105767 Current viewpoints concerning the algebraic approach to nuclear collective motion. A.Klein, Ching-Teh Li (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.237-50 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
A brief survey is given of some of the salient ideas developed over the past two decades in the program on nuclear collective motion based on the equations of motion, culminating in recent work involving the direct application of a variational method and parametrization by boson mappings. The multilevel pairing model is used throughout for illustration. (18 refs.)

105768 The generalized density matrix method in the theory of nuclear collective motion. V.G.Zelevinsky (Inst. of Nuclear Phys., Novosibirsk, USSR).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.251-70 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
The brief review of the generalized density matrix (GDM) method in the theory of nuclear collective motion is given. Basic concepts of the method are formulated and relations with traditional approaches (static mean field, time-dependent mean field, random phase approximation, cranking model and so on) are established. The crucial role of conservation laws is stressed. Applications of the method to some problems of rotation and large amplitude collective motion are discussed. (44 refs.)

105769 Aspects of boson expansion theories. T.Tamura (Dept. of Phys., Univ. of Texas, Austin, TX, USA), T.Kishimoto.
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.282-95 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
The authors first emphasize that, for a boson-expansion theory (BET) to be useful, it must use the Tamm-Dancoff representation, or its equivalent, from the beginning. Further, it must be formulated in such a way that the boson expanded operators contain only linked-cluster terms and are justified to act upon ideal-boson states. They show that a new BET which they formulated recently satisfies all these requirements. They show further that their old BET is included as a part of this BET. (13 refs.)

105770 Microscopic aspects of the interacting boson model. F.Iachello (Wright Nuclear Structure Lab., Yale Univ., New Haven, CT, USA).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.296-305 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
Some microscopic aspects of the interacting boson model are reviewed. In particular, the early work of Otsuka (1978) and some recent works in Zirnbauer and Brink (1982) and Pittel, Duval and Barrett (1982) are discussed. (18 refs.)

105771 The hydrodynamic limit of the microscopic collective model: the U(3)-boson model. D.J.Rowe (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.306-18 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
A $U(6)$-boson model is introduced which contains the Bohr-Mottelson collective model (1975) and the $U(6)$ interacting boson model as submodels, thereby extending the latter to include the giant monopole and quadrupole resonances. The $U(6)$-boson model has a $U(3)$-boson submodel which contains the BM and Elliott's (1958) $U(3)$ models as submodels, The $U(3)$-boson model is shown to be the hydrodynamic limit of the fully microscopic $Sp(3,R)$ model. (9 refs.)

105772 Vibrational and rotational flow in nuclei. A.Schuh, J.Kunz, U.Mosel (Inst. fur Theoretische Phys., Univ. Giessen, Giessen, Germany).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.402-16 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
Current and velocity distributions have been calculated for quadrupole vibrations and rotations using cranked Nilsson model with pairing correlations. For vibrations the flow pattern is similar to that obtained in recent fluid dynamical models. It is shown that the currents for low-lying states exhibit a strong vortex whereas those for the higher ones are nearly incompressible and irrotational. The microscopic reasons for this difference are discussed. For rotations it is shown that the currents can be roughly approximated as a superposition of rigid and irrotational flow but that the higher multipole components add additional structure. 21.60J Hartree-Fock and random-phase approximations

105773 An equation for the quasi-particle RPA based on the $SO(2N+1)$ Lie algebra of the fermion operators. S.Nishiyama (Dept. of Phys., Kochi Univ., Kochi, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1811-14 (June 1983).
A way of constructing an equation for the quasi-particle random phase approximation (RPA) including unpaired mode effects is proposed. The author obtains a Jacobi equation on the coset manifold $SO(2N+2)/U(N+1)$. Assuming the periodic Jacobi fields, one can get the $SO(2N+1)$ RPA equation applicable to odd fermion systems. (7 refs.)

105774 Time dependent Hartree-Fock and beyond. K.Goeke (Inst. fur Kernphys., KFA Julich, Julich, Germany), R.Y.Cusson, F.Grummer, P.-G.Reinhard, H.Reinhardt.
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.33-65 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
The time dependent Hartree-Fock method (TDHF) is reviewed and its success and failure are discussed following realistic numerical results. It is demonstrated that TDHF is basically able to describe the time evolution of one-body operators, the energy loss in inclusive deep inelastic collisions, and fusion reactions above the Coulomb barrier. For spontaneous fission, subbarrier fusion and the description of bound vibrations the quantized adiabatic time dependent Hartree-Fock theory (quantized ATDHF) is suggested and reviewed. Realistic three-dimensional calculations for heavy ion systems of $A_1+A_2\leq 32$ are presented. Recent theories based on path integral approaches (PIA) are discussed, which aim at quantizing TDHF in order to describe stationary vibrational states and subbarrier fission. The relationship of quantized ATDHF to PIA is explored in the case of vibrations including the fluctuations on top of the periodic TDHF orbits. For the description of width of one-body observables in inclusive reactions the time dependent generator coordinate method (TDGCM) is reviewed. (35 refs.)

105775 A microscopic theory of collective and independent-particle motions; time-dependent Hartree-Fock method and its extension. A.Kuriyama (Dept. of Phys., Kyushu Univ., Fukuoka, Japan).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.66-88 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
Reviews briefly the development in the microscopic description of collective and independent-particle motions. The author gives a review on a formal aspect of the time-dependent Hartree-Fock method as an approach to the description of collective motion, following the formulation given by Marumori et al. (1980). An emphasis is put on the utility of the canonicity condition. As a validity check of the TDHF approach to the description of the collective motion, the author applies this method to a simple but non-trivial model, i.e. the coupled Lipkin model. The microscopic theory of collective and independent-particle motions developed by Yamamura and Kuriyama (1981) is introduced. (17 refs.)

105776 The nuclear response function. G.F.Bertsch (Dept. of Phys.-Astron., Michigan State Univ., East Lansing, MI, USA).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.115-41 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
Presents the theory of the nuclear response in the random phase approximation (RPA). Various relations are derived between densities and currents which give rise to the well-known sum rules. Then RPA is derived via the time-dependent Hartree theory. The following formulations of RPA are shown: the configuration space representation, the coordinate space representation, Landau theory of finite systems and the RPA for separable interactions constrained by consistency. The remarkable success of RPA in describing the collective density oscillations of closed shell nuclei is illustrated with a few examples. The $\sigma\tau$ response is discussed with the application of simple theoretical considerations to the empirical data. The author points out several problems which remain in the response theory. (41 refs.)

105777 Path integral approach to many-body systems and classical quantization of time-dependent mean field. H.Kuratsuji (Dept. of Phys., Kyoto Univ., Kyoto, Japan), T.Suzuki.
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.209-20 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
The authors present the path integral formalism of many-body systems based on the representation of generalized coherent states. They give the path integral representation for the transition amplitude by utilizing the characteristic property of the coherent state and discuss its classical limit through the method of stationary phase. Applying to the bound state problem, they arrive at the classical quantization rule for the period mean field solutions, the utility of which is briefly discussed. (18 refs.)

105778 An extension of TDHF and boson-fermion expansion. M.Yamamura (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.271-81 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
A possible extension of the time-dependent Hartree-Fock theory is given with the aim of obtaining a classical image of the boson-fermion expansion. The extended form can be regarded as a canonical system with constraints and the Direct quantization reproduces the boson-fermion expansion given by Marshalek (1981). (10 refs.)

105779 Self-consistent description of nuclear excitations. Nguyen Van Giai (Div. de Phys. Theorique, Inst. de Phys. Nucleaire, Orsay, France).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.330-41 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
The nuclear response function is calculated in the framework of the self-consistent continuum RPA. The method is illustrated by applications to low-lying collective states, and to various isoscalar giant resonances. (17 refs.)

105780 Symmetry energy and isovector collective motions. S.Stringari (Dipartimento di Fisica, Libera Univ. degli Studi di Trento, Povo, Italy).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.367-79 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
Isovector collective modes are investigated in the framework of microscopic and macroscopic models of the nuclear motion. The schematic and hydrodynamical models are discussed in particular detail. It is shown that both models can be derived starting from the time dependent Hartree-Fock equations. The importance of the surface term of the symmetry energy in locating the dipole giant resonance is also discussed. (24 refs.)

21.65 NUCLEAR MATTER

105781 Landau-Ginzburg theory of phase transitions in heated rotating nuclei. A.L.Goodman (Phys. Dept., Tulane Univ., New Orleans, LA, USA).
Nucl. Phys. A (Netherlands), vol.A406, no.1, p.94-108 (12 Sept. 1983).
The Landau-Ginzburg theory is applied to heated rotating superfluid systems. It is demonstrated that the free energy F' is an even function of the order parameter Δ even when external fields are present. The energy surfaces $F'(\Delta)$ are calculated for various rotational frequencies and temperatures. These surfaces provide clear illustrations of first-order and second-order phase transitions, as well as a critical point. (16 refs.)

105782 Effect of nuclear curvature energy on the transition between nuclei and bubbles in dense matter. C.J.Pethick (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), D.G.Ravenhall, J.M.Lattimer.
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.137-40 (25 Aug. 1983).
The authors show that the density at which the transition between a state with nuclei and one with bubbles occurs is unexpectedly sensitive to the nuclear curvature energy. They suggest that this may account for the fact that Bonche and Vautherin's (1982) detailed Hartree-Fock calculations lead to a transition density of about 0.04 f^{-3}, which is significantly lower than the value $\sim$0.07 f^{-3} found from calculations based on the liquid drop model of nuclei and bubbles. 21.80 HYPERNUCLEI

105783 Molecular orbital model study of the ${}_{\Lambda}^{9}$Be, ${}_{\Lambda\Lambda}^{10}$Be, ${}_{3\Lambda}^{11}$Be and ${}_{4\Lambda}^{12}$Be hypernuclei. K.Miyahara, K.Ikeda (Dept. of Phys., Niigata Univ., Niigata, Japan), H.Bando.
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1717-30 (June 1983).
The Λ-hypernuclei ${}_{n\Lambda}^{8+n}$Be ($n=1\sim 4$) are systematically investigated by employing the molecular orbital model. Various Λ configurations are constructed of the gerade and ungerade orbitals around two α-clusters. The generator coordinate method is applied to the model after L^{π} projection. Energy spectra for $K^{\pi}=0^{\pm}$ bands, $B(E2)$ values and spectroscopic factors are calculated and discussed in connection with structure-changes of hypernuclei associated with the addition of Λ particles. (21 refs.)

105784 Structure of the ${}_{\Lambda\Lambda}^{10}$Be hypernucleus. H.Bando (Div. of Math. Phys., Fukui Univ., Fukui, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1731-45 (June 1983).
A microscopic $\alpha+\alpha+\Lambda+\Lambda$ four-body problem for the ${}_{\Lambda\Lambda}^{10}$Be hypernucleus is formulated and solved for the ground (positive parity) and excited (negative parity) bands. Energy properties, electric transition probabilities and reduced width amplitudes (spectroscopic factors) for the ${}_{\Lambda\Lambda}^{6}\mathrm{He}+\alpha$, ${}_{\Lambda}^{5}\mathrm{He}+{}_{\Lambda}^{5}\mathrm{He}$ and ${}_{\Lambda}^{9}\mathrm{Be}+\Lambda$ channels are calculated and discussed in comparison with those of ${}_{\Lambda}^{9}$Be. (17 refs.)

23.00 RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS

(see also 82.55 Radiochemistry)

23.20 ELECTROMAGNETIC TRANSITIONS

105785 A new excited level in Th-229 at 582.1±1 keV. A.El-Kamshawy, M.El-Tahawy, R.Shadhan, T.El-Ani (Dept. of Phys., Univ. of Salah El-Din, Arbil, Iraq).
Iraqi J. Sci., vol.23, no.2, p.256-73 (1982). [received: Aug. 1983]
Discusses the measurements and analysis of the direct γ-spectrum as well as the (γ,γ) coincidence spectra at the gates: 146-148 keV, 163.3-164.5 keV and 217-219 keV for U. A fast-slow (γ,γ) coincidence spectrometer of 11.2 sec. time resolution was used. In order to explain the origin of eight of these lines the authors suggest a new excited level with energy 582.1±1 keV in ^{229}Th. Furthermore, places have been found for the other five γ-lines as transitions between the known excited levels of ^{229}Th. (6 refs.)

105786 The spectroscopic study of ^{206,204}Pb with the $(\alpha,^{6}$He) reaction. M.H.Tanaka, S.Kubono (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.386-94
Clear differences have been observed between the (p,t) and $(\alpha,^{6}$He) reactions on ^{208,206}Pb. These differences in the natural parity state excitations are well explained by including the components of relative angular momena betweent the two nucleons $1\neq 0$, suggesting that the $(\alpha,^{6}$He) reaction may be a new spectroscopic tool to study not only the shell model configuration, but also the $1\neq 0$ two-nucleon correlations in the nuclei. (10 refs.)

105787 Light nuclei far from stability. A.Dobado, A.Poves (Dept. de Fisica Teorica, Univ. Autonoma de Madrid, Madrid, Spain).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.248-55
The authors try to describe theoretically the spectra of heavy potassium isotopes (A=47 to 50) and the corresponding particle-hole spectra of calcium isotopes, within a shell model approach. (12 refs.)

23.40 BETA DECAY; ELECTRON AND MUON CAPTURE

105788 The decay of ^{153}Tb oriented in a gadolinium host. I.Prochazka, J.Konicek, M.Finger, E.Simeckova, P.Simecek, V.M.Tsupko-Sitnikov (JINR, Dubna, USSR).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.8, p.903-22 (1983).
Gamma-ray anisotropies in the decay of ^{153}Tb oriented in gadolinium at low temperatures were measured with high-resolution Ge(Li) detectors. Spins of 31 levels in ^{153}Gd were unambiguously established and multipole mixing ratios of many transitions in ^{153}Gd were determined. The results are compared with previous calculations in the framework of the particle-rotor model. (25 refs.)

105789 Neutrinoless double electron capture as a tool to measure the electron neutrino mass. J.Bernabeu, A.De Rujula, C.Jarlskog (CERN, Geneva, Switzerland).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B223, no.1, p.15-28 (15 Aug. 1983).
A nucleus (Z,A) may capture two atomic electrons to become $(Z\text{-}2,A)$. For Majorana neutrinos this may occur with no neutrino emission, the process is a virtual mixing of the parent atom and the daughter atom with two electron holes. The process becomes real as the daughter atom de-excites. In some cases where the daughter nucleus is excited, the neutrinoless decay may be enhanced by its proximity to a virtual resonance. The authors identify the ^{112}Sn→^{112}Cd transition as a good case. The no-neutrino lifetime for $m_{\nu}=30$ eV ranges from 10^{22} to 10^{27} years as a function of the insufficiently well determined distance to resonance. The signatures of the two- or no-neutrino modes are very different. (16 refs.)

105790 K-capture probabilities in the decay of ^{133}Ba. K.Singh, H.S.Sahota (Dept. of Phys., Punjabi Univ., Patiala, India).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2336-9 (July 1983).
The K-capture probabilities in the decay of ^{133}Ba to 437, 383, 161 and 81 keV levels have been determined from the analysis of the K X-ray-gamma ray sum peaks observed with an intrinsic Ge detector. The measurements on the 161 and 81 keV levels are reported for the first time in the literature. (6 refs.)

105791 Change in the beta-decay probability of polarized nuclei due to the action of an electromagnetic wave. I.M.Ternov, V.N.Rodionov, A.E.Lobanov, O.F.Dorofeev (M.V. Lomonosov State Univ., Moscow, USSR).
JETP Lett. (USA), vol.37, no.6, p.342-5 (20 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.6, p.288-90 (20 March 1983). [received: Sept. 1983]
A study is made of the total and differential probabilities of the beta decay of polarized nuclei in the field of a circularly polarized electromagnetic wave in the case where the energy of the wave quantum is small compared to the rest energy of the electron. (6 refs.)

105792 Decay of mass-separated ^{187}Au (8.4 min) to ^{187}Pt. B.E.Gnade, R.W.Fink (School of Chem., Georgia Inst. of Technol., Atlanta, GA, USA), J.L.Wood.
Nucl. Phys. A (Netherlands), vol.A406, no.1, p.29-54 (12 Sept. 1983).
The decay of ^{187}Au to ^{187}Pt has been studied with mass-separated sources from the UNISOR facility. Multiscaled spectra of γ-rays, X-rays, and conversion electrons, as well as $\gamma\gamma t$, $X\gamma t$, $e\gamma t$, and eXt coincidences were obtained. The half-life of the ^{187}Au ground state was measured to be 8.4±0.3 min. A decay scheme has been constructed incorporating 88% of the decay intensity assigned to ^{187}Au. The $i_{13/2}$ band in ^{187}Pt is populated through low-spin band members. The levels at 260 and 288 keV are found to de-excite by E0 transitions. From a γ-ray gated K/β^{+} ratio, the β-decay energy of 8.4 min ^{187}Au is deduced to be $Q_{EC}=3.90\pm0.15$ MeV. The positive-parity states in ^{187}Pt are compared with calculations made using the Nilsson model with a triaxial degree of freedom. The possibility that shape coexistence is present at low energy in ^{187}Pt is discussed. (38 refs.)

105793 Ultralow-energy *K*-capture decay of ^{158}Tb: a new neutrino 'balance'. R.S.Raghavan (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. Lett. (USA), vol.51, no.11, p.975-8 (12 Sept. 1983).
An ultralow-energy *K*-capture branch has been discovered in the decay of ^{158}Tb with an energy release of only 156(17) eV above the *K*-shell threshold, the smallest known so far for a weak-decay process. It thus offers a new neutrino 'balance' with close-to-ideal decay energetics. (7 refs.)

105794 Nuclear matrix elements governing the 809 keV first-forbidden beta transition in the decay of ^{147} Nd. S.Lakshminarayana, M.Srinivasa Rao, V.Seshagiri Rao, D.L.Sastry (Lab. for Nuclear Res., Andhra Univ., Waltair, Visakhapatnam, India).
Phys. Rev. C (USA), vol.28, no.2, p.852-61 (Aug. 1983).
Energy dependence of the $^{5}/_{2}{}^{-}(809\text{ keV }\beta)^{5}/_{2}{}^{+}(91\text{ keV }\gamma)^{7}/_{2}{}^{+}$ angular correlation was measured with a fast-slow scintillation spectrometer applying the necessary attenuation correction due to the finite lifetime of the intermediate state. The present results were used in conjunction with the other available experimental observables to determine the beta matrix elements, employing Buhring's formalism as modified by Simms. The sizes of the matrix elements indicate a 'cancellation effect'. The vector matrix element ratio Λ_{CVC} following the present analysis shows a deviation from Fujita's prediction and is consistent with the theory of Damgaard and Winther. The structure of the involved levels is discussed in the framework of the one-quasiparticle phonon coupling model together with the shell model predictions. (35 refs.)

105795 Some new contributions to neutrinoless double-β decay in an SU(2)×U(1) model. C.O.Escobar (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil), V.Pleitez.
Phys. Rev. D (USA), vol.28, no.5, p.1166-9 (1 Sept. 1983).
Considers an SU(2)×U(1) model having both Dirac and Majorana mass terms for the neutrinos, with an extended Higgs sector without natural flavor conservation. Under these conditions, the author shows that for a certain range of the mass parameters of the model, some new contributions become important for neutrinoless double-β decay $[(\beta\beta)_{0\nu}]$. (8 refs.)

23.60 ALPHA DECAY

105796 A basic set of experimental data on the strong alpha transitions. D.N.Poenaru, M.Ivascu (Inst. for Phys. & Nuclear Engng., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.4, p.309-29 (1983).
The experimental data Q, $T_{1/2}$ concerning the most probable (ground state to ground state or favoured) alpha transitions for 123 even-even, 111 even-odd, 83 odd-even and 59 odd-odd nuclei are selected to meet, in each of the four groups, the criteria of best fitting the systematics of Q-value, log $T_{1/2}$, of the quantity χ_{exp} versus neutron number and the Geiger-Nuttall plot. This basic set of data can be used to find the parameters of a semiempirical formula allowing to obtain the best estimate of the alpha decay half-life, if the Q-value is known. (21 refs.)

105797 **Alpha decay rates of neutron deficient trans-tin isotopes.** I.Silisteanu (Inst. for Phys. & Nuclear Engng., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.4, p.331-8 (1983).
The many-body (shell model) and one-body α-decay rates are calculated by using the methods of unified theory of nuclear reactions. The influence of the structure on the one body rates is analysed. The calculated α-decay data are compared with experimental data and previous predictions. (17 refs.)

105798 **Systematics of alpha decay life times.** H.Sato (Inst. for Nuclear Study, Univ. of Tokyo, Tanashi, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.751-5
The relationship between α Q-values and α decay life times of even-even nuclei is studied. Assuming a simple Woods-Saxon potential having a radial shape determined by the electron scatterings for the α-A relative motion, the potential depth is determined from the α Q value for each node quantum number N_r. The α decay life times are calculated with the potential obtained, and overall agreements are obtained between the calculation and experimental value. (10 refs.)

23.90 OTHER TOPICS IN NUCLEAR DECAY AND RADIOACTIVITY

105799 **Direct proton decay of ^{147}Tm.** D.Schardt (GSI Darmstadt, Darmstadt, Germany).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.256-66
Using on-line mass separation of evaporation residues from the reaction $^{58}\mathrm{Ni}+^{92}\mathrm{Mo}\rightarrow^{150}\mathrm{Yb}^*$, a proton line of 1055±6 keV energy and 0.56±0.04 s half-life was observed. The activity was assigned to the direct proton decay of ^{147}Tm. Beta-delayed protons registered at the same mass position were found to arise from the decays of $^{147}\mathrm{Er}(T_{1/2}=2.5\pm0.2\ \mathrm{s})$ and $^{147m}\mathrm{Dy}(T_{1/2}=57\pm4\ \mathrm{s})$. (19 refs.)

24.00 NUCLEAR REACTIONS AND SCATTERING: GENERAL

24.10 NUCLEAR REACTION AND SCATTERING MODELS AND METHODS

105800 **An effective energy-dependent one-body potential for the low-energy particle-nucleus scattering problem. The one open channel case.** J.Toke, T.Matulewicz (Inst. of Experimental Phys., Warsaw Univ., Warsaw, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.8, p.609-16 (Aug. 1983).
A simple method of generating the relative motion continuum wave functions in the region of isolated resonances by using an energy-dependent effective one-body potential is proposed. The method accounts for the effects of the configuration mixing and predicts splitting of the single-particle resonances in quantitative agreement with the shell model diagonalisation approach. (10 refs.)

105801 **Remarks on the proximity scaling applied to heavy ion interaction potentials.** M.Pi, M.Barranco, X.Vinas (Facultad de Fisica, Univ. de Barcelona, Barcelona, Spain), C.Ngo, E.Tomasi, H.Ngo.
J. Phys. Lett. (France), vol.44, no.16, p.L685-8 (15 Aug. 1983).
Two heavy ion interaction potentials have been computed using the same nuclear force. One has been obtained from symmetric semi-infinite nuclear matter slabs and the other one from finite nuclei. After a proximity scaling, two rather different universal functions are obtained. The authors argue that this is due to the different surface thickness of semi-infinite nuclear matter and finite nuclei. Consequently, it is the universal function obtained from the nucleus-nucleus systematics that should be used in the applications. (12 refs.)

105802 **Multicluster fractional parentage coefficients.** L.Ya.Glozman, Yu.M.Tchuvil'sky (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
J. Phys. G (GB), vol.9, no.9, p.1033-45 (Sept. 1983).
The notion of a multicluster fractional parentage coefficient (MCFPC) is introduced to study reactions with the emission of several composite particles. A compact formalism has been developed for calculating MCFPC in the harmonic-oscillator translationally invariant shell model (TISM) which is based on the relation between the TISM and the conventional shell model. Tables of MCFPC for the disintegration of ^{16}O into three fragments of 11, 3 and 2 nucleons are given by way of example. (21 refs.)

105803 **Multiple reflections in the path-integral approach to barrier penetration.** D.M.Brink (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England), U.Smilansky.
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.301-12 (29 Aug. 1983).
A primitive saddle-point evaluation of a path integral for the amplitude for penetrating a potential barrier is inaccurate if the incident energy is near the top of the barrier. A careful summation of contributions from a sequence of saddles corresponding to multiple reflections under the barrier gives some improvement. The effect of all multiple reflections can be taken into account accurately by evaluating the path integral by a Γ-function uniform approximation. (10 refs.)

105804 **Reduced nuclear amplitudes in quantum chromodynamics.** S.J.Brodsky (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA), J.R.Hiller.
Phys. Rev. C (USA), vol.28, no.2, p.475-82 (Aug. 1983).
The authors present a new formalism which systematically accounts for nucleaon compositeness in nuclear scattering amplitudes, consistent with quantum chromodynamics and covariance. Reduced gauge-invariant nuclear amplitudes are defined which have elementary quantum chromodynamic scaling properties. The procedure is applied to the photodisintegration and electrodisintegration of the deuteron as a test of nuclear chromodynamics and as a method to isolate contributions of dibaryon resonances. (19 refs.)

105805 **On a combined model of direct and compound-resonant nuclear reactions.** V.Olkhovskii, S.Chinarov.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1141-6 (Aug. 1983). In Russian.
A method of a combined description of direct and resonant processes of nucleon-light nucleus collision is developed as based on a unitary representation of Simonius (1974) for the *S*-matrix. The nonresonant *S*-matrix factor is modelled by the potential scattering or by the coupled channel method with the zero imaginary potential part. Energies and configurations of the resonant states are constructed from collective and one-particle statesdetermined energies. Corrections for the resonant energies and with experimentally widths are modelled using the random matrix method. The ergodicity hypothesis in a supposition of the random processes' local stationarity is also used. Calculation results are compared with experimental data for neutron scattering by ^{12}C nuclei. Two resonances with energies of about 2.45 and 4.70 MeV in the proton scattering by ^{12}C nuclei are predicted. (12 refs.)

105806 **Estimates of multistep processes.** M.A.Nagarajan (Daresbury Lab., Warrington, England).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.395-419
A variational principle, based on microscopic trial wavefunctions to calculate the corrections to the Born Amplitude, is discussed. The formalism can be applied to the case of transitions to many body final channels. Applications of the formalism to some model calculations is discussed. (12 refs.)

105807 **Microscopic study of local potential between nuclei on the basis of the resonating group method.** H.Horiuchi, K.Aoki, T.Wada (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.806-25
In order to study the inter-nucleus interaction in a local potential picture, the equivalent local potentials to the non-local potentials of the resonating group method have been derived by using the WKB method. On the basis of the analyses of the localized potentials, the authors discuss several problems including the potential shape, its energy-dependence, contributions from many types of the exchange process, comparison with other approaches to derive the local potential, and the foundation of the orthogonality condition model. (47 refs.)

24.10H Optical and diffraction models

105808 Second-order terms in the ^{3}He-nucleus folding model. F.Duggan (Dept. of Phys., Wheatstone Lab., King's Coll., London, England).
J. Phys. G (GB), vol.9, no.9, p.1047-61 (Sept. 1983).
The ^{3}He-nucleus optical potential has been calculated in an extended folding model in which the first- and second-order terms are calculated separately, the internal motion of the ^{3}He nucleons is included, the break-up of the projectile is simulated and the target excited states are coupled to the imaginary potential. An improved version of the Kuo effective interaction including odd-state forces and the projectile energy in the second order terms is used in this model. The data analysis indicates that, in this model, the second-order potential must be calculated more accurately if agreement with experiment is to be obtained and that the backward-angle data are sensitive to the imaginary potential. A comparison has been made with previous analyses. (53 refs.)

105809 Isovector correction to the Kerman, McManus, and Thaler formalism. L.Ray (Dept. of Phys., Univ. of Texas, Austin, TX, USA), P.C.Tandy, R.M.Thaler.
Phys. Rev. C (USA), vol.28, no.2, p.506-12 (Aug. 1983).
In the derivation of the scaled, first order optical potential of Kerman, McManus, and Thaler it is assumed that all target nucleons have identical isospin character. This makes possible the scaling by $(A-1)/A$ that is characteristic of the Kerman-McManus-Thaler formalism. In applications, the difference between the interactions of the projectile with target neutrons and protons is imposed upon the scaled optical potential. The nuclear scattering amplitude calculated in this way differs from the correct first order result which can be obtained by recognizing the isospin difference at the onset of the derivation. A new expression for the Kerman-McManus-Thaler optical potential is obtained. The result is the usual isospin weighted sum of the projectile-proton and projectile-neutron interactions, plus a correction to the scaled first order optical potential which is proportional to the square of the projectile-nucleon isovector interaction. Numerical estimates of the volumes and root mean square radii of this isovector correction are given for proton and pion projectiles. Relative to the usual first order term, the volume integral of this correction is found to be neglible in most cases, except for (3,3) resonant energy pion-nucleus scattering where it can contribute several percent. (25 refs.)

24.30 RESONANCE REACTIONS AND SCATTERING

105810 Analysis of the ^{28}Si(p, γ)^{29}P reaction data in the region of the subbarrier single particle resonances. T.Matulewicz, P.Decowski, M.Kicinska-Habior, B.Sikora, J.Toke (Inst. of Experimental Phys., Warsaw Univ., Warsaw, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.8, p.617-24 (Aug. 1983).
The ^{28}Si(p, γ)^{29}P reaction data have been analysed in terms of a modified direct-semidirect capture model which accounts for the presence of broad shape (single-particle) resonances in the entrance channel. Values of the spectroscopic factors for the ground state and 1.65 MeV and 2.88 MeV resonances in ^{29}P nuclei were extracted and found to be consistent with those obtained in other experiments. The modified theoretical analysis scheme was found to provide a convenient tool for analysing the radiative capture reaction data. (23 refs.)

105811 Effective coupling constants for spin-flip and non spin-flip E1 transitions in A$\sim$90 nuclei. S.Nakayama, T.Shibata, T.Kishimoto, M.Sasao, H.Ejiri (Dept. of Phys., Osaka Univ., Osaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2325-31 (July 1983).
Radiative proton capture reactions through two isobaric analogue resonances (IAR) in ^{89}Y were studied; one was the 12.07 MeV 2d$_{5/2}$ state lying just above the neutron threshold energy B_n and another was the 14.48 MeV 2d$_{3/2}$ state lying well above B_n. E1 transitions from these IARs were studied for favoured cases with no spin-flip and no change of radial nodes, and for unfavoured cases spin-flip and/or change of radial nodes. At the 2d$_{3/2}$ IAR lying well above B_n, the favoured transitions show the resonance feature, but the unfavoured ones do not. At the 2d$_{5/2}$ IAR near B_n, however, both the favoured and unfavoured transitions show the resonance feature. The anomalous resonant feature of the unfavoured transitions is interpreted as being mainly due to the compound process. Favoured transitions are all found to be reduced by factors $\sim$0.3 over the shell model values. (26 refs.)

105812 Proton spin-orbit splittings in the continuum. M.Tohyama (Cyclotron Lab., Inst. of Phys. & Chem. Res., Saitama, Japan), N.Onishi.
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2332-5 (July 1983).
The spin-orbit splittings are calculated for the proton single-particle resonances in ^{91}Nb, ^{121}Sb and ^{209}Bi nuclei. Many sets of spin-orbit partners with narrow widths are obtained in these nuclei. It is suggested that the proton single-particle resonances provide a useful tool of studying the origin of the spin-orbit coupling. (6 refs.)

105813 Widths of giant resonances. S.Yoshida (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.142-56 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
Theories of giant resonances are reviewed. The Green's functions and response functions are introduced in connection with inelastic scattering cross sections for giant resonance excitations. The Green's function is calculated in terms of the effective Hamiltonian in a truncated bound configuration space. A few examples of existing calculations are reviewed, their methods of the calculations are examined and the results are compared with each other. (21 refs.)

105814 Sum rule approach to giant resonance states. T.Suzuki (Res. Inst. for Fundamental Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.319-29 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
On the basis of sum rules for the nuclear four-current, structure of isoscalar giant resonance states is discussed. A qualitative argument on spin-isospin-dependent excitations of nuclei is also provided with the aid of sum rules in the quark model. (20 refs.)

105815 Fluid-dynamical models for giant resonances. G.Holzwarth (Siegen Univ., Siegen, Germany).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.357-66 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
Presents a survey of nuclear fluid dynamics as derived from the generalized scaling approach. The essential feature is the dynamical distortion of the local Fermi surface which leads to additional restoring forces for the elementary modes. Application to giant resonances resolves previous discrepancies, satisfies two essential quantum mechanical sum rules and leads to detailed predictions for transition densities, flow patterns and strength distributions. (18 refs.)

105816 Recent developments in the description of electric giant resonances. O.Bohigas (Div. de Phys. Theorique, Inst. Phys. Nucleaire, Orsay, France).
Prog. Theor. Phys. Suppl. (Japan), no.74-75, p.380-401 (1983). (Proceedings of the 5th Kyoto Summer Institute on Microscopic Theories of Nuclear Collective Motions, Kyoto, Japan, 12-16 July 1982).
The experimental situation concerning electric isovector dipole and isoscalar monopole strengths is reviewed. When describing the giant resonance region, emphasis is put on self-consistent RPA theories. The role of the effective interaction is examined. The photoabsorption cross-section in the region 40$\sim$140 MeV is also discussed as well as evaluations of the dipole enhancement factor. (63 refs.)

105817 The distribution of the low-energy octupole strength in ^{48}Ca, ^{90}Zr and ^{208}Pb. Y.Fujita, M.Fujiwara, S.Morinobu, I.Katayama, T.Yamazaki (Res. Center for Nuclear Phys., Osaka Univ., Ibaraki, Osaka, Japan), T.Itahashi, S.I.Hayakawa, H.Ikegami.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.275-9
The fine structure of the low-energy octupole resonance has been studied for ^{48}Ca, ^{90}Zr and ^{208}Pb by inelastic scattering of 65 MeV protons. The energy-weighted sum rule fractions of 11-15% were found in every nucleus including ^{208}Pb. An accurate spreading width Γ was obtained for these nuclei. It was found that the interaction V which causes the spreading was fairly constant irrespective of the large difference in mass number. (13 refs.)

105818 Low energy octupole resonance in deformed nuclei. T.Tohei, J.I.Hirota, T.Nakagawa (Dept. of Phys., Tohoku Univ., Sendai, Japan), T.Saito, Y.Fujii, M.H.Tanaka.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.285-8
Inelastic α-particle scattering at $E_\alpha=65$ MeV has been measured to study the splitting of the resonance strength in the isoscalar low energy octupole resonance (LEOR) in Sm isotopes. Two bumps in the LEOR are found in the deformed nuclei ^{154}Sm and ^{152}Sm. The centre-of-gravity energy of the LEOR is systematically lower than the expected one in Sm isotopes. The effect of quadrupole deformation is more obvious for the LEOR than for the GQR. (5 refs.)

105819 Hexadecapole component in giant quadrupole resonance region of ^{208}Pb. T.Yamagata, S.Kishimoto, K.Iwamoto, K.Yuasa (Dept. of Phys., Konan Univ., Higashinada, Kobe, Japan), M.Tanaka, S.Nakayama, T.Fukuda, M.Inoue, M.Fujiwara, Y.Fujita, I.Miura, H.Ogata.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.289-93
The L=4 component located at $E_x\sim2\hbar\omega$ in ^{208}Pb was studied using the inelastic scattering of ^{3}He at 140 MeV. An energy-weighted sum-rule fraction of 23-29% was found in the giant quadrupole resonance region. (10 refs.)

105820 Study of the (^{3}He,t) reaction on heavy nuclei. H.P.Morsch, G.P.A.Berg, P.Decowski, J.L.Tain, M.Rogge, L.Zemlo, P.Turek, J.Meissburger, J.G.M.Romer (Inst. fur Kernphys., Kernforschungsanlage Julich, Julich, Germany).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.294-8
In order to investigate isovector giant resonances and spin-flip excitations the authors have studied the (^{3}He,t) reaction on ^{120}Sn and ^{208}Pb using a 135 MeV ^{3}He beam from the Julich isochronous cyclotron. The outgoing particles were momentum analysed using the magnetic spectrometer BIG KARL. Data have been taken at extreme forward angles between 0^0 and 5^0. Spectra taken at 0^0 are shown for ^{120}Sn and ^{208}Pb. The strong excitation of the isobaric analog state and the underlying 1^+ Gamow-Teller resonance is clearly seen. (3 refs.)

105821 Proton strength functions in the mass region of 30 to 70. E.Arai, T.Matsuzaki (Nuclear Reactor Res. Lab., Tokyo Inst. of Technol., Tokyo, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.741-5
Theoretical values of s- and p-wave proton strength functions were calculated for the target mass region between 30 and 70, and were compared with experimental results. A reasonable agreement was obtained for s-wave proton strength function. (14 refs.)

105822 The excitation and decay of isoscalar giant resonances. A.Van Der Woude (Kernfysisch Versneller Inst., Groningen, Netherlands).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.351-87
Gives a survey of the present knowledge on isoscalar giant resonances. Attention is paid to the problems involved in the analysis of inelastic hadron scattering data. One of the main open questions, namely the behaviour of the monopole resonances in light nuclei, is discussed in some detail. The excitation of giant resonances by inelastic heavy ion scattering is discussed. It is shown that at present no new information on giant resonances has come out of heavy ion scattering. Future prospectives, when higher energy heavy ion beams with better quality become available are discussed. The damping and decay of giant resonances are described. The trend observed for the width of the giant resonances is summarised. An extensive discussion of the fission width of giant resonances in ^{238}U is presented. (48 refs.)

24.50 DIRECT REACTIONS

105823 Non-orthogonality and overcompleteness in direct nuclear reactions. M.C.Birse, E.F.Redish (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Nucl. Phys. A (Netherlands), vol.A406, no.1, p.149-92 (12 Sept. 1983).
When rearrangement reactions are too strong to be treated by a one-step DWBA, they must be described by coupled reaction channel (CRC) equations or by a multistep DWBA derived from them. The derivation of these equations requires the use of projection operators on subspaces which are in general not orthogonal and which may be linearly dependent. The authors consider the case of many coupled two-cluster channels, and show how solving the non-orthogonality kernel to give an orthogonalized CRC formally simplifies the structure of the equation and clarifies the relations between different methods, including connected kernel approaches. They use the requirement that the distorted Faddeev (N=3) or LBRS equations (general N) be satisfied in the two-cluster model space. They demonstrate that this determines the distortion potentials and that the resulting pole approximation yields the orthogonalized CRC equations. A modified one- and two-step DWBA is written in which non-orthogonality corrections are summed to all orders in each step. Methods of generating the non-orthogonality correction operator are discussed. (57 refs.)

105824 Deuteron D-state effects on the vector polarization observables in (d,p) reactions at 55.4 MeV. T.Kubo (Inst. of Phys. & Chem. Res., Saitama, Japan), H.Ohnuma, T.Kishimoto, M.A.Brennan, Y.Yoshida, M.Sugitani, T.Suehiro.
Phys. Lett. B (Netherlands), vol.127B, no.6, p.403-6 (11 Aug. 1983).
The vector analyzing power A_y and polarization P_y have been measured for the $l_n=0$ transitions ^{116}Sn(d,p)^{117}Sn(gs) and ^{117}Sn(d,p)^{118}Sn(gs) at E_d=55.4 MeV to obtain the quantities $S_p=2P_y-2A_y$ and $S_d=3A_y-2P_y$. The deuteron D-state effects which are clearly observable for S_d are found to arise primarily from contributions quadratic in the D-state amplitude. (17 refs.)

105825 Knock-out effects in (p,p′) reactions. B.T.Kim (Dept. of Phys., Sung Kyun Kwan Univ., Suwon, Korea), T.Udagawa, T.Tamura.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.280-4
The knock-out mechanism is considered to account for the forward-angle peaking angular distribution of (p,p′) reactions, which multi-step direct reaction theories could not explain. The formulations including spin and isospin dependent central interactions as well as tensor forces are presented. Exchange effects are also taken into account. The results of ^{54}Fe(p,p′) at 62 MeV are given. It turns out that the knock-out processes can be responsible for the forward-angle peaking cross sections. (8 refs.)

105826 Direct and direct-fusion reaction approach to continuum spectra of nuclear reactions. T.Udagawa (Dept. of Phys., Univ. of Texas, Austin, TX, USA).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.322-39
The multistep direct reaction approach to nuclear reactions leading to the continuum is extended so as to also include partial fusion taking place in channels reached via direct reactions. The calculation of cross sections of particles emitted from such reactions is briefly discussed, showing particularly that these can be evaluated by utilizing the same ingredients as those used in the usual direct reaction calculations. As an example, the author considers the breakup-fusion reaction (i.e. breakup followed by fusion of one of the broken-up pair with the target nucleus) and applies it to analyze spectra of protons emitted from α-induced reactions. It is shown that many features of the observed spectra can be accounted for by this machine. (19 refs.)

105827 Effective interaction for deuteron stripping and pick up reactions. R.C.Johnson (Dept. of Phys., Univ. of Surrey, Guildford, England).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.340-7
The distinctions between nucleon-nucleon effective interactions for inelastic scattering and rearrangement collisions is clarified. Calculations relevant to recent (d,p) and (p,d) data are reported. (20 refs.)

105828 Direct and pre-equilibrium deexcitations following the (α,α') reaction studied by discrete γ-α' correlations. H.Ohsumi, K.Okada, T.Shibata, Y.Nagai, T.Motobayashi, N.Fujishita, H.Ejiri (Dept. Phys., Osaka Univ., Osaka, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.736-40
The α'-Γ coincidence measurements for the ^{118}Sn(α,$\alpha'x\gamma$) reaction showed for the first time that the rather low excitation region (Ex=20-50 MeV) of the medium-heavy nuclei once excited by the 109 MeV alpha inelastic scattering, decays by emitting fast direct and/or pre-equilibrium neutrons. (3 refs.)

24.60 STATISTICAL THEORY AND FLUCTUATIONS

105829 Time dependence of pre-equilibrium reactions. K.W.McVoy (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.649-64
Discusses fluctuations in doorway dominated reactions, which can be described as a kind of diffusion process. The author studies the time dependence of this diffusion process. (10 refs.)

105830 Application of the statistical multistep compound theory to light ion induced reactions. R.Bonetti (Istituto di Fisica Generale Appl., Univ. di Milano, Milano, Italy).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.665-73
The applications of the SMCE theory to the experimental data of cross-sections and correlation widths are briefly reviewed. Particular emphasis is given to the extraction from experimental data of the two-body residual interaction strength V_0. It is shown that the use of matrix elements of a density-dependent interaction of the Yukawa form makes possible reproduction of the experimental data of SMCE reactions with a V_0 value which turns out to be consistent with the one used in independent work. (16 refs.)

105831 A test of validity of the Markovian hypothesis in the theory of pre-equilibrium processes in nucleon induced reactions. M.Kawai, H.A.Weidenmuller (Dept. of Phys., Kyushu Univ., Fukuoka, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.718-26
The Markovian hypothesis in the theory of pre-equilibrium processes in nucleon induced reactions is examined. An estimate of the time between successive collisions, t, and the time for a single collision, τ, shows that the necessary condition, $t \gg \tau$, for the hypothesis is reasonably well satisfied for the incident energy ≤ 150 MeV, in contrast to some recent claims. Some medium corrections to the estimate of t and τ are also discussed. (11 refs.)

105832 Preequilibrium reaction cross section including angular momentum conservation. G.Keeni, S.Yoshida (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.746-50
A method is described for calculating the preequilibrium reaction cross-section taking into account energy and angular momentum conservation. The escape and spreading widths are calculated in a method resembling that of Feshbach et al. (1979). But the exciton number decreasing intranuclear transitions are also taken into account in the calculation of the spreading widths. The master equation is then solved following a prescription given by Yoshida (1982) which gives both the preequilibrium and equilibrium reaction cross-sections. (4 refs.)

105833 Statistical aspects of multistep process in nuclear reactions. M.S.Hussein (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.774-85
Several statistical aspects of nuclear multistep processes are discussed. The connection between the cross-section auto-correlation function and the average number of maxima in the excitation function is emphasized in the case of multistep compound (pre-compound) processes. The energy averaged angular distributions of transitions to specific final states proceeding through these processes are discussed in light- and heavy-ion induced reactions. (13 refs.)

24.70 POLARIZATION IN REACTIONS AND SCATTERING

105835 High-momentum-transfer processes with polarized deuterons. L.L.Frankfurt, M.I.Strikman (Leningrad Nuclear Phys. Inst., Gatchina, USSR).
Nucl. Phys. A (Netherlands), vol.A405, no.3, p.557-80 (5 Sept. 1983).
On the basis of the nuclear core hypothesis the authors predict that cross sections for high-energy (e,e′), (e,e′N), (h,N) inclusive reactions and the cross sections for the high-momentum-transfer $e+D \rightarrow e+N+N$ reaction off polarized deuterons should strongly depend on the deuteron polarization in the kinematics forbidden for the scattering off a free nucleon. A problem of the polarized neutron structure function extraction from $\vec{e}\vec{D}$ data is analysed. They demonstrate also that the measurement of the $D+N \rightarrow \vec{p}+X$ reaction is sufficient to reconstruct the spin-density matrix of a rapid deuteron. On the basis of the perturbative QCD the rule of the minimal change of helicity for leading hadron production in high-energy inclusive hadron processes is suggested. (26 refs.)

105836 ^{24}Mg($\vec{p}$,d) reaction at 65 and 80 MeV. K.Hatanaka, N.Matsuoka, H.Sakai, M.Fujiwara, T.Saito, K.Hosono (Res. Center for Nuclear Phys., Osaka Univ., Osaka, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.430-7
The differential cross sections and analyzing powers were measured for the ^{24}Mg($\vec{p}$,d)^{23}Mg reaction at 65 and 80 MeV. DWBA calculations were performed for the transitions to the $5/2^+$, 0.45 MeV, the $1/2^+$, 2.36 MeV and the $1/2^+$, 4.36 MeV states including the data at 33.6 and 94.8 MeV. The adiabatic approximation could reproduce the cross section in the same quality over all the energies investigated. As to the analyzing power for the $1/2^+$ states, the large values and energy dependence observed around θcm=20° were well reproduced without introduction of any arbitrary radial or angular momentum cutoff. The extracted spectroscopic factors were smaller than the theoretical predictions by a factor 2 to 4, but did not show a strong energy dependence. (24 refs.)

105837 Polarization phenomena in heavy ion transfer reactions. F.D.Santos (Centro de Fisica Nuclear, Univ. de Lisboa, Lisboa, Portugal).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.54-69
Discusses polarisation phenomena using $^7\vec{\mathrm{Li}}$ projectiles, concentrating on the analysing power. DWBA analyses are described. (36 refs.)

24.75 GENERAL PROPERTIES OF FISSION

105838 Fission from saddle to exit: influence of curvature and compression energies. J.Treiner, R.W.Hasse (Inst. Laue-Langevin, Grenoble, France), P.Schuck.
J. Phys. Lett. (France), vol.44, no.17, p.L733-9 (1 Sept. 1983).
The authors investigate the influence of terms beyond the standard Liquid Drop Model on the slope of the fission valley. An important reduction of the slope is obtained when using values of the curvature energy calculated from effective forces currently in use, thus corroborating a recent microscopic calculation by Berger et al. (1981). (25 refs.)

25.00 NUCLEAR REACTIONS AND SCATTERING: SPECIFIC REACTIONS

25.10 NUCLEAR REACTIONS AND SCATTERING INVOLVING FEW-NUCLEON SYSTEMS

105839 The rate of the ^{3}He(p,$e^+\nu$)^{4}He reaction. P.E.Tegner (Dept. of Phys., Univ. of Stockholm, Stockholm, Sweden), C.Bargholtz.
Astrophys. J. (USA), vol.272, no.1, pt.1, p.311-16 (1 Sept. 1983).
The $p+{}^3$He reaction rate is calculated by comparing the matrix element to the matrix element for thermal neutron capture. Meson exchange contributions amount to approximately 20%. The authors predict a cross section factor $S(E_p=0)$ between 4 and 25×10^{-20} keV barns and an upper limit to the corresponding neutrino capture rate in ^{37}Cl and ^{71}Ga of 0.1 and 0.03 SNU, respectively. 25.20 PHOTONUCLEAR REACTIONS AND PHOTON SCATTERING

105840 A semimicroscopic calculation of the photodisintegration of the ^{32}S nucleus. B.S.Ishkhanov, V.G.Kanzyuba, I.M.Kapitonov, V.N.Orlin, V.I.Shvedunov (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).

Nucl. Phys. A (Netherlands), vol.A405, no.2, p.287-300 (29 Aug. 1983).

Using the semimicroscopic nuclear vibration model and the combined model for giant resonance decay, the authors have calculated the giant dipole resonance structure and the partial photonucleon cross sections for ^{32}S. The theoretical parameters were estimated from the spectroscopic data. The calculation satisfactorily describes the structure and decay characteristics of the ^{32}S giant resonance. It has been shown that the statistical mechanism plays a significant role in the photodisintegration of ^{32}S. (24 refs.)

105841 Relation between coherent π^0 photoproduction and π-nucleus elastic scattering. P.Hoodbhoy, G.A.Miller (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).

Phys. Rev. C (USA), vol.28, no.2, p.848-51 (Aug. 1983).

The authors show that, at energies of the (3,3) resonance, the angular distributions for coherent, nuclear π^0 photoproduction and elastic π-nucleus scattering are approximately related through simple geometric and kinematic factors. (10 refs.)

25.30 LEPTON-INDUCED REACTIONS AND SCATTERING

105842 Excitation of the quasi-bound state in ^{4}He by electron scattering at medium momentum transfer. G.Kobschall, C.Ottermann, K.Maurer, K.Rohrich, C.Schmitt, V.H.Walther (Inst. fur Kernphys., Univ. Mainz, Mainz, Germany).

Nucl. Phys. A (Netherlands), vol.A405, no.3, p.648-52 (5 Sept. 1983).

The cross sections of inelastic electron scattering on ^{4}He leading to the quasi-bound state (0^+, $\epsilon=20.1$ MeV) were measured in the momentum transfer range 0.8 $\mathrm{fm}^{-2}<q^2<2.4\ \mathrm{fm}^{-2}$. The authors found it to be a pure longitudinal transition and give the form factor of this CO transition. (12 refs.)

105843 Inelastic electron scattering from ^{9}Be. R.W.Lourie, W.Bertozzi, T.N.Buti, J.M.Finn, F.W.Hersman, C.Hyde, J.Kelly, M.A.Kovash, S.Kowalski (Dept. of Phys., MIT, Cambridge, MA, USA), M.V.Hynes, B.E.Norum, B.L.Berman.

Phys. Rev. C (USA), vol.28, no.2, p.489-96 (Aug. 1983).

The electromagnetic form factors have been measured for the lowest two $T={}^3/_2$ states in ^{9}Be at 14.393 and 16.976 MeV, the positive-parity state at 17.490 MeV, and a level of a previously unknown J^π at 16.671 MeV. The range of effective momentum transfer is $0.9\leq q_e\leq 2.5\ \mathrm{fm}^{-1}$. The data for the $T={}^3/_2$ states show considerable deviation from the results of intermediate-coupling shell-model calculations. In particular, for $q_e\leq 1.5\ \mathrm{fm}^{-1}$, where the $M1$ multipole dominates, the data lie well above these calculated values. There is some evidence that the state at 16.671 MeV has positive parity. The results of single-particle shell-model and Nilsson-model calculations are compared with the data for this state. The experimental form factor for the 17.490-MeV state can be fitted with single-particle shell-model results in the $2s$-$1d$ space. (30 refs.)

105844 Electron scattering at 180° from the 'single-hole' states in ^{15}N. R.P.Singhal (Dept. of Natural Philosophy, Univ. of Glasgow, Glasgow, Scotland), J.Dubach, R.S.Hicks, R.A.Lindgren, B.Parker, G.A.Peterson.

Phys. Rev. C (USA), vol.28, no.2, p.513-20 (Aug. 1983).

Results are presented for the scattering of electrons through 180° from the ${}^1/_2{}^-$ ground state and the ${}^3/_2{}^-$ excited state at 6.32 MeV in ^{15}N. The range of the momentum transfer q is from 0.70 to 3.25 fm^{-1}. Comparisons are made with the predictions of the $0p$-shell proton-hole model, a large basis $2\hbar\omega$ shell model calculation, and core polarization models. In general, it was found that the theoretical description of the data improved markedly as the model space was expanded, but the predicted cross sections were consistently below the data for $q>2.4\ \mathrm{fm}^{-1}$. The present data rule out the low value of the Migdal parameter g' needed to described the (e,e′) data for ^{12}C and ^{13}C, and do not support the previous suggestion that pion-condensation effects are important in finite nuclear systems. (26 refs.)

105845 Differential muon-capture rate and the deuterium form factors in the timelike region. S.L.Mintz (Dept. of Phys. Sci., Florida Internat. Univ., Miami, FL, USA).

Phys. Rev. C (USA), vol.28, no.2, p.556-60 (Aug. 1983).

The differential muon-capture rate, $d\Gamma/dE_n$, is obtained over the total allowed range of E_n, the neutron energy for both F_A, the axial current form factor, analytically continued to the timelike region, and for F_A under the condition that $F_A(q^2$, timelike$)=F_A(q^2$, spacelike). It is found that a difference of approximately 10% exists in the extreme timelike region. The contribution from the timelike region to the muon-capture rate, Γ, is calculated and found to be negligible. (16 refs.)

105846 Response functions for deep inelastic scattering from ^{40}Ca. M.Deady, C.F.Williamson, J.Wong (Dept. of Phys., MIT, Cambridge, MA, USA), P.D.Zimmerman, C.Blatchley, J.M.Finn, J.LeRose, P.Sioshansi, R.Altemus, J.S.McCarthy, R.R.Whitney.

Phys. Rev. C (USA), vol.28, no.2, p.631-4 (Aug. 1983).

Deep inelastic electron scattering cross sections have been measured from ^{40}Ca at energies between 100 and 375 MeV and at scattering angles of 90° and 140°. Longitudinal and transverse response functions at three-vector momentum transfers of 330, 370, and 410 MeV/c were extracted from these data using a Rosenbluth separation. The integrated longitudinal response functions for the three momentum transfer are found to have, respectively, 65%, 75%, and 90% of the longitudinal strength predicted by the Fermi gas model. 25.40 NUCLEON-INDUCED REACTIONS AND SCATTERING

(see also 28.20 Neutron physics)

105847 Target nucleus excitation dependence of correlation in the multiple production on nuclei at 400 GeV and the additive quark model. D.Ghosh, J.Roy, D.Banerjee, K.Sengupta, S.Naha, M.Basu, T.G.Thakurta (Dept. of Phys., Jadavpur Univ., Calcutta, India).

Can. J. Phys. (Canada), vol.61, no.9, p.1308-10 (Sept. 1983).

The authors present a comparison of the data on the target nucleus excitation dependence of two-particle rapidity correlations among relativistic particles in hadron-nucleus interactions at 400 GeV/c with the additive quark model (AQM) for multiple production of particles off nuclei. The number of grey tracks (n_g) has been taken as the parameter characterizing the degree of excitation. The dependence has been found to agree quantitatively with the predictions of the AQM. (4 refs.)

105848 Study of the low-energy neutron inelastic scattering in deformed transitional nuclei: ^{186}W. J.R.Fernandez Diaz, R.Cabezas Solorzano (Hat. Inst. for Nuclear Res., Navana, Cuba).

J. Phys. G (GB), vol.9, no.9, p.1115-23 (Sept. 1983).

A study of inelastic neutron scattering by the nucleus ^{186}W at an incident energy of 2.75 MeV using the coupled-channel method has been made. Consideration is made of the 2^+(0.122 MeV), 4^+(0.3966 MeV), 2^+(0.7375 MeV), 3^+(0.8618 MeV) and 4^+(1.031 MeV) excited states. It is shown that in this energy range the process may be described satisfactorily by the Davydov-Filippov model, considering ^{186}W as a deformed nucleus with non-axial symmetry, given the quadrupole and hexadecapole deformations. The scattering process through the compound nucleus is calculated according t the Hauser-Feshbach formula. It is shown that the presence of direct excitation processes may be partly due to the non-axiality of ^{186}W. (19 refs.)

105849 High-resolution investigation of the ^{116}Sn(p,p′) reaction. H.Wienke, H.P.Blok, J.Blok (Natuurkundig Lab., Vrije Univ., Amsterdam, Netherlands).

Nucl. Phys. A (Netherlands), vol.A405, no.2, p.237-51 (29 Aug. 1983).

Angular distributions for states up to 4.0 MeV excitation energy have been measured with the ^{116}Sn(p,p′) reaction at $E_p=25$ MeV. They were compared with macroscopic DWBA calculations in order to extract L-values and deformation parameters. Coupled-channels calculations were performed to investigate two-phonon excitations and the mixing between one- and two-phonon states. The results of the present study are compared with other experimental results and with model calculations. (19 refs.)

105850 Optical model analysis of intermediate energy p-^{4}He scattering. J.M.Greben, R.Gourishankar (Phys. Dept., Univ. of Alberta, Edmonton, Alberta, Canada).

Nucl. Phys. A (Netherlands), vol.A405, no.3, p.445-62 (5 Sept. 1983).

Recent Wolfenstein R-parameter data are used to explain and resolve previous problems with optical model descriptions p-^{4}He elastic scattering at 500 MeV. An essential component in this optical model analysis is a qualitative interpretation of different features of the elastic data in terms of the Born approximation. First the authors show that the R-data require the real spin-orbit potential to have certain geometrical properties which were missing in previous analyses. They can then show that the fast fall-off of the cross section for small angles, together with the rapid increase and subsequent decrease of the polarization, establishes the need for an attractive tail in the real central potential. Other properties of the potentials can also be inferred from this qualitative analysis in particular a strong reduction of the spin-orbit potential. The final potential gives a reduction of the χ^2/datapoint by about 20 in comparison to previous potentials, and underlines the usefulness of the qualitative Born analysis. (27 refs.)

105851 Large-angle proton emission in the ^{9}Be(p,2p) reaction at 300 MeV. R.E.L.Green, D.H.Boal, R.L.Helmer, K.P.Jackson, R.G.Korteling (Simon Fraser Univ., Burnaby, Canada).

Nucl. Phys. A (Netherlands), vol.A405, no.3, p.463-96 (5 Sept. 1983).

A ^{9}Be(p,2p) coincidence experiment performed to further elucidate the reaction mechanism for the production of energetic wide-angle protons in intermediate-energy proton-induced reactions is reported. Detectors in a coplanar geometry were used to measure coincidences between trigger protons at 90° to the beam and forward-angle protons on the opposite side of the beam. The incident proton energy was 300 MeV. The authors report both the inclusive spectra for the trigger protons and the differential mean multiplicities for the coincidence events. The present results are compared with two previous experiments which covered a more restrictive kinematical range. Calculations are performed with both phase-space and direct knockout models, and compared with experiment. Observation of angle and energy correlation effects suggested by knockout models indicate that such direct mechanisms provide a significant contribution to energetic wide-angle inclusive proton spectra. (52 refs.)

105852 Resonance averaged channel radiative neutron capture cross sections. Y.K.Ho, M.A.Lone (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).

Nucl. Phys. A (Netherlands), vol.A406, no.1, p.1-17 (12 Sept. 1983).

In order to apply Lane and Lynn's channel capture model (1960) in calculations with a realistic optical model potential, the authors have derived an approximate wave function for the entrance channel in the neutron-nucleus reaction, based on the intermediate interaction model. With this formalism the averaged channel radiative neutron capture cross section in the resonance region is written as the sum of three terms. The authors obtain an expression for the average valence radiative width similar to that of Lane and Mughabghab (1974). They have investigated the magnitude and energy dependence of the three terms as a function of the neutron incident energy. Calculated results for ^{98}Mo and ^{55}Mn show that the averaged channel radiative capture cross section in the giant resonance region of the neutron strength function may account for a considerable fraction of the total (n,γ) cross section; at lower neutron energies a large part of this channel capture arises from the fluctuation term. They have also calculated the partial capture cross section in ^{98}Mo and ^{55}Mn at 2.4 keV and 24 keV, respectively, and compared the ^{98}Mo results with the experimental data. (19 refs.)

105853 An interference effect in the channel radiative neutron capture process. Y.K.Ho, M.A.Lone (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).

Nucl. Phys. A (Netherlands), vol.A406, no.1, p.18-28 (12 Sept. 1983).

The authors show that the small thermal neutron radiative capture cross sections in ^{12}C and neighbouring nuclides are the result of destructive interference between the potential scattering wave and the resonance scattering wave near the nuclear surface, resulting in a drastic cancellation in the radial integral. The behaviour of the scattering wave function is examined, and the general condition for the occurrence of such cancellation is discussed. The expression for the channel radiative capture cross section which has been derived has the same structure as the Lane-Lynn formula but is expressed in terms of different parameters. In addition, this investigation shows that if the optical model well depth is adjusted so that the binding energy of the $p_{1/2}$ orbit in ^{12}C is kept at the experimental value, then the calculated results for the potential and channel radiative neutron capture cross sections are insensitive to the value of the nuclear radius. (8 refs.)

105854 Effects of the ^{3}He D state in the reaction ^{2}H(p,γ)^{3}He. S.E.King, N.R.Roberson, H.R.Weller (Duke Univ., Durham, NC, USA), D.R.Tilley.
Phys. Rev. Lett. (USA), vol.51, no.10, p.877-80 (5 Sept. 1983).
Angular distributions of the reaction ^{2}H(p,γ)^{3}He have been measured for E_p from 6.5 to 16 MeV. A comparison of the extracted a_2 coefficients with an effective two-body direct calculation indicates a sensitivity to the inclusion of D-state components in the ^{3}He wave function. These calculations use ^{3}He bound-state wave functions generated from Faddeev-type equations. The theoretical three-body ^{3}He ground-state wave functions having D-state probabilities of 5%-9% ($D_2=-0.224$ to -0.236) are consistent with the present data. (17 refs.)

105855 Evidence of energy dependence in proton-neutron effective interaction for ^{90}Zr(p,d)^{89}Zr reactions at energies from 20 MeV to 120 MeV. S.Kosugi (Div. of Reactor Safety Evaluation, JAERI, Ibaraki, Japan), T.Kosugi.
Phys. Lett. B (Netherlands), vol.127B, no.6, p.389-92 (11 Aug. 1983).
Exact-finite-range distorted-wave Born approximation (EFR-DWBA) calculations are performed for the reactions ^{90}Zr(p,d)^{89}Zr [9/2$^+$ (gs), 1/2$^-$ (0.588 MeV) and 3/2$^-$ (1.095 MeV)] at the incident energies 22.9, 31, 55, 65 and 121 MeV. When the energy-independent p-n interaction is used in the DWBA integral, the extracted spectroscopic factor shows a noticeable incident energy dependence which is quite similar to that of the proton optical-model potential used as distorting potentials. This fact supports the recent suggestion that the p-n effective interaction which is consistent with the proton optical-model potential should be used for (d,p) and (p,d) reactions. (16 refs.)

105856 Study of the 18.30 and 19.40 MeV states in ^{12}C in intermediate energy proton scattering. K.W.Jones, C.Glashausser, S.Nanda, R.de Swiniarski (Rutgers Univ., New Brunswick, NJ, USA), T.A.Carey, W.Cornelius, J.M.Moss, J.B.McClelland, S.J.Seestrom-Morris, J.R.Comfort, J.-L.Escudie, M.Gazzaly, N.Hintz, G.Igo, M.Haji-Saeid, C.A.Whitten.
Phys. Lett. B (Netherlands), vol.128B, no.5, p.281-4 (1 Sept. 1983).
Angular distributions of the cross section and analysing power have been measured for proton inelastic scattering from ^{12}C at 398, 597, and 698 MeV. Angular distributions of the spin-flip probability have been measured at 398 MeV. Comparison of these data with DWIA calculations strongly suggests $2^-(T=0)$ and $2^-(T=1)$ assignments to states at 18.30 and 19.40 MeV, respectively; their wave functions are well described by recent calculations of Millener. (22 refs.)

105857 Absolute cross section for the reaction ^{3}H(p,γ_0)^{4}He and a review of ^{4}He(γ,p$_0$)^{3}H measurements. J.R.Calarco, S.S.Hanna, C.C.Chang, E.M.Diener, E.Kuhlmann, G.A.Fisher (Dept. of Phys., Stanford Univ., Stanford, CA, USA).
Phys. Rev. C (USA), vol.28, no.2, p.483-8 (Aug. 1983).
Accurate differential cross sections have been measured at 90° for the reaction ^{3}H(p,γ)^{4}He at E_p=8.34 and 13.6 MeV. Previously published results for both ^{3}H(p,γ)^{4}He and ^{4}He(γ,p)^{3}H are reviewed and compared with the present data. The theoretical implications of the results are briefly discussed. (37 refs.)

105858 Double differential inclusive hydrogen and helium spectra from neutron-induced reactions on carbon at 27.4, 39.7, and 60.7 MeV. T.S.Subramanian, J.L.Romero, F.P.Brady, J.W.Watson, D.H.Fitzgerald, R.Garrett, G.A.Needham, J.L.Ullmann, C.I.Zanelli (Dept. of Phys., Univ. of California, Davis, CA, USA), D.J.Brenner, R.E.Prael.
Phys. Rev. C (USA), vol.28, no.2, p.521-8 (Aug. 1983).
Double differential cross sections for the neutron-induced production of p, d, t, ^{3}He, and alpha particles from carbon have been measured using unpolarized neutrons. Neutron beam energies of 27.4, 39.7, and 60.7 MeV were used. The charged particle energy spectra at nine laboratory angles—15, 20, 35, 40, 45, 65, 90, 130, and 150 deg—range up to the kinematic maximum, from a lower energy cutoff of 4 MeV for p, d, t, and alpha and 8 MeV for ^{3}He. A CH target was used so that the absolute normalization was obtained simultaneously from the n-p cross sections. Intranuclear cascade plus deexcitation calculations were carried out. The data are compared with these calculations and with available proton induced (charge symmetric) reaction spectra. (24 refs.)

105859 Mesonic exchange currents and radiative thermal neutron capture by the deuteron. J.Torre (Inst. des Sci. Nucleaires, Grenoble, France), B.Goulard.
Phys. Rev. C (USA), vol.28, no.2, p.529-37 (Aug. 1983).
Radiative capture of thermal neutrons by the deuteron: n+d$\rightarrow$^{3}H+γ is investigated. Wave functions built upon definite nucleon-nucleon forces are used to describe both the bound state and the scattering two-body state. The role of mesonic exchange currents and of two-nucleon forces are investigated in detail. Finally, the bearing of genuine three-nucleon forces on the cross sections and other related properties is exhibited. (14 refs.)

105860 Sensitivity of N-d polarization observables on the off-shell behaviour of the N-N interaction. H.Zankel, W.Plessas, J.Haidenbauer (Inst. fur Theoretische Phys., Karl-Franzens-Univ. Graz, Graz, Austria).
Phys. Rev. C (USA), vol.28, no.2, p.538-41 (Aug. 1983).
The authors demonstrate the off-shell sensitivity of second-order polarization observables in elastic N-d scattering by means of the spin-correlation parameter $C_{y,y}$. For the N-N interaction they start with the Paris potential and then generate on-shell equivalent separable potentials with different off-shell properties. The results for E_d=10 and 20 MeV reported here show sizeable off-shell effects, which can be related to the different potential behavior in the inner region $r\lesssim1.2$ fm. (16 refs.)

105861 Coupled channel effects in ^{26}Mg(p,p′) at 40 MeV. B.Zwieglinksi, G.M.Crawley, J.A.Nolen,Jr., R.M.Ronningen (Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).
Phys. Rev. C (USA), vol.28, no.2, p.542-55 (Aug. 1983).
Angular distributions for the elastic and inelastic scattering of 40 MeV protons for the 2_1^+ 1.809, 2_2^+ 2.938, 3_1^+ 3.940, 4_1^+ 4.318, 4_2^+ 4.900, 4_3^+ 5.474, and 4_4^+ 5.716 MeV states in ^{26}Mg have been measured to provide a test for the collective properties of these states as predicted by the wave functions of Chung and Wildenthal. Because of interference of the direct one-step 0_1^+-J_f excitation, with the two step 0^+-J_{int}-J_f excitations through the possible intermediate states J_{int}, coupled-channel effects are observable in the angular distribution for the state J_f. The effects of strongly constructive (for the 2_2^+ and 4_3^+ states), weakly constructive (for the 4_1^+ state), weakly destructive (for the 4_4^+ state), and strongly destructive (for the 4_2^+ state) interference are observed in the measured angular distributions. The experimental results are compared with coupled-channel calculations which utilize the shell-model-predicted multipole (L=2 and 4) matrix elements as coupling amplitudes. It is demonstrated that this approach can reproduce the observed patterns, the type of interference being governed by the relative phase between the direct 0_1^+-J_f and the dominant J_{int}-J_f matrix elements(s). The neutron and proton components for seven inelastic transitions are determined by combining the known electromagnetic transition rates with the proton inelastic transition rates measured in the present work. For most transitions the dominant is correctly indicated by the shell model. In particular, the 0_1^+-2_2^+ transition is confirmed to be predominantly a neutron transition. (36 refs.)

105862 Angle-energy correlated model of preequilibrium angular distributions. C.Costa, H.Gruppelaar, J.M.Akkermans (Netherlands Energy Res. Found., Petten, Netherlands).
Phys. Rev. C (USA), vol.28, no.2, p.587-601 (Aug. 1983).
The authors present a new version of the generalized exciton model of preequilibrium angular distributions is proposed to predict the energy dependence of inelastic neutron-scattering angular distributions. The Kikuchi-Kawai expression is used for the scattering of the followed 'fast particle' in nuclear matter, whereby its full angle-energy correlation is taken into account to describe the emission at the first collision. For the higher steps an energy-averaged scattering kernel is employed for the description of the changes in direction of the fast particle on its way inside the nucleus. The refraction of the incident and outgoing beam is described by the approximation of geometrical optics. This model retains the simple mathematical structure previously introduced by Akkermans et al., providing an easy interpretation of the observed energy-dependence of angular-distribution coefficients without the use of fit parameters. A comparison with experimental neutron-emission data and with the empirical Kalbach-Mann systematics illustrates the predictive ability of the present physical model. (19 refs.)

105863 $1f_{7/2}$ neutron hole strength in ^{59}Ni with the ^{60}Ni($\vec{p}$,d)^{59}Ni reaction at 94 MeV. H.Nann, D.W.Miller, W.W.Jacobs, D.W.Devins, W.P.Jones (Dept. of Phys., Indiana Univ., Bloomington, IN, USA).
Phys. Rev. C (USA), vol.28, no.2, p.642-51 (Aug. 1983).
The ^{60}Ni($\vec{p}$,d)^{59}Ni reaction has been studied with 94-MeV polarized protons. Angular distributions of the differential cross section and analyzing power have been measured for states in ^{59}Ni up to an excitation energy of 4.8 MeV. A characteristic j dependence of the ($\vec{p}$,d) analyzing powers was observed for l=1 and l=3 transfers, which allowed reliable spin determinations to be made for hole states in ^{59}Ni. As a result, spins of 7/2$^-$ were assigned to the levels at 2.63, 3.04, 3.73, 4.16, 4.23, 4.56, and 4.69 MeV in ^{59}Ni. Standard distorted-wave Born approximation calculations have been performed and their predictive power to describe the shape of the differential cross section and analyzing power angular distributions was tested as a function of the input parameters. No large discrepancies between calculated and experimental cross sections were found. Relative spectroscopic factors for the neutron pickup from the $1f_{7/2}$ orbital were extracted and compared to recent shell-model predictions. These shell-model calculations account quite well for the centroid of the observed $1f_{7/2}$ neutron hole distribution but fail to reproduce the strength distribution. (33 refs.)

105864 Parity violation in nucleon-nucleus elastic scattering within a phenomenological single particle model. Y.Avishai (Phys. Dept., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).
Phys. Rev. C (USA), vol.28, no.2, p.656-9 (Aug. 1983).
Using a phenomenological neutron-^{40}Ca strong and weak potentials at low energy the author calculates the asymmetry A in the total cross section between positive and negative incoming helicity states, the asymmetry I in the differential elastic cross sections, and the neutron spin rotation angle $d\phi/dz$. In general, max $|I/A|\gg1$. Taking into account the relevant cross sections, it turns out that sometimes, measuring I (instead of A) can save a substantial amount of beam time. (16 refs.)

105865 Measurement of the electron capture branching ratio of ^{7}Be. T.R.Donoghue, E.Sugarbaker, M.Wiescher, T.C.Rinckel, K.E.Sale (Dept. of Phys., Ohio State Univ., Columbus, OH, USA), C.P.Browne, E.D.Berners, R.W.Tarara, R.E.Warner.
Phys. Rev. C (USA), vol.28, no.2, p.875-8 (Aug. 1983).
The value of the electron capture branching ratio of ^{7}Be to the 478 keV state in ^{7}Li has been measured using sources of determinable intensity fabricated by capturing in silicon surface barrier detectors ^{7}Be recoils from the ^{10}B(p,α)^{7}Be reaction at E_p=1.5 MeV and 4.5 MeV. Results from independent measurements utilizing detectors implanted in a scattering chamber and in the focal plane of a magnetic spectrograph are in good agreement. An absolute determination of the rate at which the 478 keV gamma rays were emitted from each source yielded a weighted average value of 10.6±0.5% for the branching ratio. This result is in agreement with the previously accepted value of 10.37±0.12% and does not support the recent suggestion that the branching ratio is appreciably larger. (14 refs.)

105866 Radial parameters in nucleon-nucleus scattering. G.Faldt, A.Ingemarsson (Gustaf Werner Inst., Uppsala, Sweden).
Phys. Scr. (Sweden), vol.28, no.2, p.136-8 (Aug. 1983).
The authors investigate the effects of the strength of the nucleon-nucleon interaction on the nucleon-nucleus reaction cross section and on the diffractive angular pattern of the elastic differential cross section. (8 refs.)

105867 Analysing power-polarization inequality in the inelastic scattering of protons on ^{12}C for incident energies from 22.0 to 29.0 MeV. In beam proton-gamma ray coincidence studies using polarized beam. T.Fujisawa (Cyclotron Lab., Inst. of Phys. & Chem. Res., Saitama, Japan).
Sci. Pap. Inst. Phys. & Chem. Res. (Japan), vol.77, no.2, p.113-70 (June 1983).
The difference between the analyzing power and polarization in the inelastic scattering of protons on ^{12}C(4.44 MeV 2$^+$ state) is determined by measuring the spin flip probability of polarised protons with a (p,$p'\gamma$) coincidence technique. The analyzing power (A), spin flip probability (SF), spin flip asymmetry (SFA) and partial differential cross section are also determined. The angular distributions are measured at incident energies of 24.1, 26.2, and 28.7 MeV at intervals of lab. angles of 7.5° or 15°. The excitation functions are measured from 22 to 29 MeV at intervals of about 0.5 MeV for lab. scattering angles of 45°, 60°, 75°, 105°, 120°, 135°, and 150°. The (A-P) and SFA show pronounced interference-like energy dependence. The (A-P) has large values of more than 50% at 135° and 150° for 26.2 MeV. The macro- and microscopic distorted wave Born approximation (DWBA) and coupled channel calculation are carried out for the 28.7 MeV data. They could not reproduce the angular distributions of SFA and (A-P) at 28.7 MeV. On the other hand, the coupled channel calculation with Breit-Wigner resonance terms (CCBW) well reproduced the angular distributions of (A-P) and SFA at 28.7 and 24.1 MeV. The assigned spins and parities (J^π=3/2$^-$ at E_{cm}=26.5 MeV and J^π=3/2$^+$ at E_{cm}=22 MeV) are consistent with those obtained by Geramb and Gaillard (1979). The (A-P) and SFA are very sensitive to the spin, parity, phase, amplitude and resonance energy in the CCBW calculation. (42 refs.)

105868 Proton scattering in the interacting boson model. E.Cereda, M.Pignanelli, S.Micheletti (Dipartimento di Fisica, Univ. di Milano, Milano, Italy), M.N.Harakeh, S.Y.Van Der Werf, R.De Leo.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.270-4
Differential cross sections for proton scattering on ^{100}Mo and ^{112}Cd have been measured at $E_p=51$ MeV. The data are analyzed by coupled channel calculations, with coupling amplitudes taken from the interacting boson approximation. Information on transition densities is obtained. The reliability of the method is discussed. (5 refs.)

105869 A perspective on sequential transfer reactions. P.D.Kunz (Nuclear Phys. Lab., Univ. of Colorado, Boulder, CO, USA).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.304-21
The inclusion of some higher order effects in charge exchange and inelastic scattering of nucleons from nuclei has been treated by two primary methods. The first is the use of the nucleon-nucleon G matrix in an impulse approximation framework for nucleon projectile energies above 100 MeV projectile, and the second is the sequential transfer method which has been generally used at the lower energies. The implications for the applications of the sequential transfer method to the (p,t) reaction indicate that the sequential transfer terms used for this reaction may be replaced by using effective interactions for the transfer operator. The implications are discussed. (42 refs.)

105870 Non-direct transitions in transfer reactions and spectroscopy. S.Fortier (Inst. de Phys. Nucleaire, Orsay, France).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.357-65
A number of (^{3}He,α),(α,^{3}He) and (α,t) transitions in the f 7/2 region appear to be dominated by a pure two-step mechanism. Based on the J^π dependence of theoretical angular distributions, spin and parity assignments have been tenatively proposed. A strong inhibition of the direct process is also observed for some $L=0$ transitions in the (p,t) and (t,p) reactions to Ge isotopes. The data are in agreement with the assumption of a predominant two-step process with inelastic excitation in the proton channel. (10 refs.)

105871 Extended study of (p-d-t) process in the (p,t) reactions including the unbound state channels. M.Igarashi (Dept. of Phys., Tokyo Medical Coll., Shinjuku, Tokyo, Japan), K.-I.Kubo.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.376-85
The roles of simultaneous (p-t) and sequential (p-d-t) transfer processes are investigated for (p,t) reactions. For the intermediate channels in the sequential transfer process, the $^1S_0$ and $^3S_1+^{33}D_1$ unbound deuteron states as well as the ground state are taken into account. One-step and sequential transfer processes are accurately evaluated employing the realistic wave functions and finite-range interactions. The sequential transfer process is found to be dominant for both natural and unnatural parity transitions in the reaction investigated here; ^{208}Pb(p,t)^{206}Pb at 22 and 35 MeV. The analyzing-power function does not get small even when the unbound deuteron states are included in the calculation with the realistic wave functions. (16 refs.)

105872 Breakup reaction of ^{3}He with protons at 65 MeV. S.Kakigi, K.Fukunaga, T.Ohsawa (Inst. for Chem. Res., Kyoto Univ., Kyoto, Japan), A.Okihana, H.Nakamura-Yokota, T.Sekioka, S.Tanaka, S.Kato.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.631-4
In quasifree scattering (QFS), the experimental differential cross section ($d^5\sigma_{exp}$) is found to be smaller than the value calculated in the plane-wave impulse approximation ($d^5\sigma_{PWIA}$). The difference can be accounted for by multiple-scattering effect. A multiple-scattering factor $|\eta|^2$ has been compared with the normalization factor $N=d^5\sigma_{exp}/d^5\sigma_{PWIA}$ as a function of the incident energy or the correlation angles, and both are well reproduced. In the present work, the multiple-scattering effect is studied for the p-p QFS in the ^{3}He(p,pp)^{2}H reaction. (6 refs.)

105873 The doorway to the continuum: quasifree nucleon-nucleon interactions. H.D.Holmgren, G.Ciangaru, C.C.Chang, P.G.Roos (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.704-17
In 1975 the University of Maryland group launched a program to identify the dominant mechanisms by which medium energy light ions interact with nuclei. Various analyses using an initial quasifree nucleon-nucleon interaction have been reasonably successful in accounting for the spectral shapes of both (p,p′) and (p,n) reactions at angles up to 60°. Several particle-particle (p,2p) and particle-gamma coincidence studies have recently been carried out in the continuum region using 100-200 MeV protons which provide a clearer picture of the dominant reaction mechanisms. The authors focus on proton induced reactions, particularly coincidence (p,2p) studies cm ^{58}Ni, ^{27}Al, ^{90}Zr and ^{208}Bi, and recent theoretical advances. (19 refs.)

105874 Extension of generalized exciton model and calculation of (p,p′) angular distribution. A.Iwamoto, K.Harada (JAERI, Ibaraki, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.727-35
A model to extend the generalized exciton model is proposed. It takes into account the reaction kinematics more properly than the previous models, and yet the solution is obtained in a very simple form. Numerical calculations for the (p,p′) reaction on several targets show an improvement of the fitting in the angular distribution at forward angles. (7 refs.)

105875 Relations between the simultaneous and sequential transfer of two nucleons. G.R.Satchler (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.44-53
Discusses the relationship between one-step (simultaneous) and two-step (sequential) reactions in terms of a perturbation theory expansion such as DWBA. (t,p), (p,t) and (γ,d) reactions are analysed. (23 refs.)

25.50 ^{2}H- AND ^{3}H-INDUCED REACTIONS AND SCATTERING

105876 Vector analyzing powers for valence and inner shell pickup in the ^{116}Sn($\vec{d}$,t)^{115}Sn and ^{116}Sn($\vec{d}$,^{3}He)^{115}In reactions. R.H.Siemssen (Kernfysisch Versneller Inst., Groningen, Netherlands), C.C.Foster, W.W.Jacobs, W.P.Jones, D.W.Miller, M.Saber, F.Soga.
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.205-20 (29 Aug. 1983).
Differential cross-section and vector analyzing-power angular distributions were measured at $E_d=50$ MeV for the ^{116}Sn($\vec{d}$,t)^{115}Sn and ^{116}Sn($\vec{d}$,^{3}He)^{115}In reactions in the angular range from 6° to 26° for excitation energies up to 25 MeV. In addition to transitions to low-lying states in ^{115}Sn and ^{115}In, data were obtained for the deep-lying hole states in ^{115}Sn. DWBA calculations in general give a good account of the analyzing powers for pickup of the valence shell nucleons. For states at 1.47 MeV (unresolved multiplet) and at 1.65 MeV in ^{115}In, new spin assignments could be made on the basis of the analyzing-power measurements. Analyzing powers for the deeply bound hole states indicate a strong overlap of the different subshell orbitals, although the gross structure peaks still contain characteristic analyzing-power signatures. (30 refs.)

105877 Effects of the proton-neutron hole interaction to the form factor in (*d*,*t*) reactions on $N=50$ target nuclei. R.Namai (Dept. of Phys., Tokyo Inst. of Technol., Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1704-16 (June 1983).
The proton-neutron hole interaction is included in the calculation of form factors for (*d*,*t*) reactions on ^{90}Zr and ^{92}Mo targets. The form factor is generated by the Green function method in which the results of shell model calculations are fully used. The interaction causes the form factor to be enhanced in the nuclear interior and depressed beyond the nuclear surface. It is shown that the isotone dependence of the spectroscopic factor deduced from the experiment is well reproduced by the present model. (23 refs.)

105878 Strong *E*1 transitions in ^{9}Be, ^{11}Be, and ^{13}C. D.J.Millener, J.W.Olness, E.K.Warburton (Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. C (USA), vol.28, no.2, p.497-505 (Aug. 1983).
The Doppler shift attenuation method has been used to make two measurements of the mean life of the ^{11}Be 320-keV level. The results are 150±30 fs from the ^{9}Be(t,pγ)^{11}Be reaction and 168±17 fs from the ^{3}H(^{9}Be,pγ)^{11}Be reaction. The adopted value of 166±15 fs, from the present and previous measurements, corresponds to an extremely strong *E*1 transition of 0.36±0.03 W.u. The adopted energy of the ground state transition from this and previous measurements is 320.04±0.10 keV. It is shown that the magnitude of this *E*1 transition can be understood on the basis of the shell-model calculations only if realistic single-particle wave functions are used. A similar theoretical treatment is given for strong *E*1 transitions in ^{9}Be and ^{13}C. (28 refs.)

105879 Proton hole states in ^{95}Y and ^{95,97,99}Nb. E.R.Flynn, R.E.Brown (Los Alamos Nat. Lab., Los Alamos, NM, USA), F.Ajzenberg-Selove, J.A.Cizewski.
Phys. Rev. C (USA), vol.28, no.2, p.575-86 (Aug. 1983).
The proton hole states of ^{95}Y and ^{95,97,99}Nb have been studied by the ($\vec{t}$,α) reaction using a polarized beam of 17 MeV tritons on targets of ^{96}Zr and ^{96,98,100}Mo. The results yield a number of new levels as well as numerous new spin assignments based on the large analyzing powers characteristic of the ($\vec{t}$,α) reaction. Examination of the systematics of the resulting level schemes indicates a tendency towards deformation with increasing neutron number, which is expected given the known deformed region above $A=100$. However, ^{97}Nb is also clearly affected by the $N=56$ subshell closure. This subshell

closure has a major effect on the level structure of ^{96}Zr but is completely washed out in ^{98}Mo. (21 refs.)

105880 ^{79}As via proton pickup. S.Mordechai (Univ. of Pennsylvania, Philadelphia, PA, USA), S.LaFrance, H.T.Fortune.
Phys. Rev. C (USA), vol.28, no.2, p.623-30 (Aug. 1983).
The reaction ^{80}Se(t,α)^{79}As has been investigated with an 18-MeV triton beam. Twenty-six levels of ^{79}As (many of them previously unreported) have been identified up to about 3.5 meV excitation energy. Angular distributions were measured and compared with distorted-wave Born-approximation calculations, in order to extract L values and spectroscopic factors. Most of the expected strength for pickup from the $2p$ and $1f_{5/2}$ orbitals is observed. Behaviour of the low-lying negative-parity states for various As isotopes is presented and compared with the predictions of a rotational model with prolate deformation and Coriolis coupling. The observed first and second $9/2^+$ states in odd-A isotopes give further evidence for the shape transition suggested recently for this mass region. (25 refs.)

105881 Nuclear moments of ^{9}Li. F.D.Correll, L.Madansky (Dept. of Phys., Johns Hopkins Univ., Baltimore, MD, USA), R.A.Hardekopf, J.W.Sunier.
Phys. Rev. C (USA), vol.28, no.2, p.862-74 (Aug. 1983).
The ground-state magnetic dipole and electric quadrupole moments of the β emitter ^{9}Li($J^\pi={}^3/_2{}^-$, $T_{1/2}=0.176$ s) have been measured for the first time. Polarized ^{9}Li nuclei were produced in the ^{7}Li(t,p) reaction, using 5-6 MeV polarized tritons. The recoiling ^{9}Li nuclei were stopped either in Au foils or in LiNbO$_3$ single crystals, and their polarization was detected by measuring the β-decay asymmetry. Nuclear magnetic resonance techniques were used to depolarize the nuclei, and the resonant frequencies were deduced from changes in the asymmetry. The ^{9}Li dipole moment was deduced from the measured Larmor frequency in Au; the result, including corrections for diamagnetic shielding and the Knight shift, is $|\mu|=3.4391(6)\ \mu_N$. The ratio of the ^{9}Li quadrupole moment to that of ^{7}Li was derived from their respective quadrupole couplings in LiNbO$_3$; the value is $|Q(^9\mathrm{Li})/Q(^7\mathrm{Li})|=0.88\pm0.18$. Both results are in agreement with shell model predictions. (65 refs.)

105882 Precise determination of two-step contributions in (d,α) reaction by using vector and tensor analyzing powers for the ^{208}Pb(d,α)^{206}Tl(g.s;0$^-$) reaction. K.Hashimoto, Y.Aoki, H.Iida, K.Nagano, H.Tanaka, M.Takei, Y.Tagishi, K.Yagi (Inst. of Phys. & Tandem Accelerator Center, Univ. of Tsukuba, Ibaraki, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.366-75
Vector and tensor analyzing powers and cross sections for the ^{208}Pb(d,α)^{206}Tl(g.s;0$^-$) reaction at E$_d$=21.5 MeV have been measured in order to study contributions of the sequential transfer two-step processes (d,t) (t,α) and (d,^{3}He) (^{3}He,α). Intensities of the two-step processes have been determined so as to reproduce each of the intensity of the one-nucleon transfer reactions involved. The first- and second-order DWBA calculations reproduce the (d,α) data very well. The intensities of the two-step processes are less than that of the experimental (d,α) data by about one order in magnitude. (12 refs.)

105883 Ground state transitions in (d,^{6}Li) reactions on sd-shell nuclei. W.Oelert, G.Palla (Inst. fur Kernphys., Kernforschungsanlage Julich, Julich, Germany).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.420-9
Alpha spectroscopic factors for nuclei of the sd shell are investigated in the case of (d,^{6}Li) reaction at E$_d$=80 MeV. The importance of a careful choice of optical potentials and the necessity of employing coupled channel calculations are demonstrated for transitions leading to the ground states. (11 refs.)

25.60 ^{3}HE- AND ^{4}HE-INDUCED REACTIONS AND SCATTERING

105884 Study of ^{46,48}Ca(α,p) reactions. C.Ellegaard, J.D.Garrett, O.Hansen, S.Y.Van Der Werf (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark), R.R.Betts, S.B.Dicenzo, B.F.Bayman.
Nucl. Phys. A (Netherlands), vol.A406, no.1, p.134-48 (12 Sept. 1983).
The ^{46}Ca(α,p)^{49}Sc and ^{48}Ca(α,p)^{51}Sc reactions have been studied at a bombarding energy of 25 MeV. The data are compared with the results of DWBA calculations using simple shell-model form factors—the overall agreement is, however, quite poor. The expectation that a state corresponding to an 1f$_{7/2}$ proton coupled to a neutron pairing vibration would be excited in the ^{46}Ca(α,p)^{49}Sc reaction is borne out although the observed strength is somewhat smaller than expected. (18 refs.)

105885 High energy (^{3}He,d) proton stripping by ^{27}Al and ^{28}Si nuclei: Transitions to excited states. A.Djaloeis, S.Gopal, J.Bojowald, W.Oelert, P.Turek, C.Mayer-Boricke (Inst. fur Kernphys., KFA Julich, Julich, Germany).
Phys. Rev. C (USA), vol.28, no.2, p.54-74 (Aug. 1983).
Angular distributions for the ^{27}Al(^{3}He,d)^{28}Si* and ^{28}Si(^{3}He,d)^{20}P* reactions have been measured at $E_{3(\mathrm{He})}=130$ MeV in the angular range of $9°\lesssim\theta_{\mathrm{c.m.}}\lesssim40°$. In the proton-unbound excitation energy region, four prominent peaks (E_x=11.61, 12.67, 13.26, and 14.33 MeV) from the ^{27}Al(^{3}He,d)^{28}Si reaction and three peaks (E_x=6.59, 8.08, and 10.17 MeV) from the ^{28}Si(^{3}He,d)^{29}P reaction, are reported and analyzed for the first time. The data have been analyzed in terms of the DWBA theory, using optical model and other relevant parameters determined in a previous paper on the ground state transitions. In general, satisfactory fits to the experimental angular distributions are obtained. Spectroscopic information has been extracted and compared with the results available in the literature. (15 refs.)

105886 Neutron-multiplicity distributions for (α,xnγ) reactions with E_α=50-120 MeV and the pre-equilibrium neutron deexcitation processes. K.Maeda, T.Shibata, H.Ejiri (Dept. of Phys., Osaka Univ., Osaka, Japan), H.Sakai.
Phys. Rev. C (USA), vol.28, no.2, p.635-41 (Aug. 1983).
Pre-equilibrium and equilibrium deexcitation processes for (α,x,nγ) reactions induced by 50-120 MeV α particles were studied. Reaction channels were identified by measuring rotational γ rays characteristic of the reaction residues. The branching of the reaction channels gave neutron multiplicity distributions. Features characteristic of the pre-equilibrium process were seen in the reaction channels with small neutron multiplicity x. An exciton model calculation code was developed so as to incorporate both multiparticle emission at the fast pre-equilibrium stage and multiparticle evaporation at the slow equilibrium stage. The calculation reproduced the neutron multiplicity distributions in the whole range of E_α=50-120 MeV. The pre-equilibrium fractions and the entry lines from the pre-equilibrium stage to the equilibrium one were deduced. The pre-equilibrium fractions were found to be approximately 40-60%, being rather independent of the individual reaction channel. The entry lines slowly increase from 25 to 35 MeV with increasing projectile energy. (25 refs.)

105887 Single particle strengths in A=28 nuclei via (α,t) and (α,^{3}He) reactions. M.Yasue, T.Tanabe, S.Kubono, M.Sugitani, J.Kokame (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan), Y.Kadota, Y.Taniguchi.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.438-45
The ^{27}Al(α,t) and (α,^{3}He) reactions have been measured at E$_\alpha$=64.5 MeV. The experimental angular distributions have been analyzed by exact finite-range DWBA calculations, assuming a nucleon stripping mechanism. The distributions of spectroscopic strengths for the single-particle transitions with transferred angular momenta L=0, 1, 2, 3 and 4 have been obtained. (15 refs.)

105888 Breakup process for the 100 MeV ^{3}He interacting with the ^{165}Ho and ^{166,167}Er nuclei. T.Motobayashi (Dept. of Phys., Osaka Univ., Osaka, Japan), SA.Shimizu, H.Ejiri, T.Shibata, K.Okada, M.Sasao, K.Maeda, H.Suzuki, H.Sakai.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.626-30
The projectile breakup process for 100 MeV ^{3}He interacting with ^{165}Ho and ^{166,167}Er was studied by measuring singles and coincidence spectra of the breakup fragments and following gamma-rays. Comparison of the charge particle spectra for ^{3}He induced reactions with those of ^{4}He induced reactions showed a large contribution of the breakup process for ^{3}He. Contributions of the elastic breakup, inelastic breakup and breakup fusion processes were deduced individually from the particle-gamma coincidence measurements at forward angles. (10 refs.)

105889 Resonant and nonresonant particle decay following α-bombardment on medium heavy nuclei. T.Shibata, K.Okada, M.Noumachi, H.Ohsumi, Y.Nagai, T.Motobayashi (Dept. of Phys., Osaka Univ., Osaka, Japan), H.Ejiri, H.Sakai, A.Shimizu, K.Maeda.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.674-89
Nonstatistical particle decay from resonant and nonresonant states excited by α-induced reactions were studied using various kinds of correlation measurements. Protons and neutrons emitted from ^{165}Ho(α,xnypγ) and ^{164}Dy(α,xnγ) reactions show the pre-equilibrium particle decay. Inclusive proton spectrum, cross sections of individual reaction channels, and proton and neutron spectra for each reaction channel were analyzed by using an exciton model. The ratio of escape width to total width was determined to be ~0.3 for E$_x$~100 MeV at the beginning of the reaction so as to fit the experimental results. Neutrons emitted from the ^{119}Sn(α,α'n) and ^{92}Zr(α,α'n) reactions show contributions of three different reaction mechanisms as follows: (1) fast neutron emission from the giant quadrupole resonance, (2) pre-equilibrium neutrons and (3) knocked-out neutrons. (29 refs.)

105890 A model for alpha particle induced reactions. E.Gadioli, E.Gadioli Erba (Istituto de Fisica, Univ. di Milano, Milano, Italy).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.690-703
Calculations of particle spectra and excitation functions of several reactions induced by alpha particles with energy up to 160 MeV on A~60 and A~90 nuclei, which satisfactorily reproduce the experimental data are presented. Different alpha-nucleus interaction mechanisms have been considered. The interaction of the alpha particle with individual nucleons of the target nucleus leading to a pre-equilibrium cascade of alpha-nucleon scatterings during which the alpha may be reemitted or may breakup to four nucleons seem to be the dominant process. The calculations allow one to reproduce the experimental data with an accuracy comparable with that of previous calculations of nucleon induced reactions, without introducing new free parameters. 25.70 HEAVY ION INDUCED REACTIONS AND SCATTERING

105891 Analysis of the statistical *S* matrix generated in fitting $^{16}O+^{28}Si$ elastic scattering. R.J.W.Hodgson (Phys. Dept., Univ. of Ottawa, Ottawa, Ontario, Canada).
Can. J. Phys. (Canada), vol.61, no.9, p.1362-9 (Sept. 1983).
An *S* matrix, which gives very good fits for the elastic scattering of $^{16}O+^{28}Si$ over the angular range $15°<\theta<180°$, has been generated at six energies (21 MeV$<E$(centre of mass)$<$35 MeV). The *S* matrix is composed of a parametric form plus a small statistical term for each partial wave. The properties of the *S* matrix have been examined in order to deduce the mechanisms involved in the reaction. The 180° excitation function has also been computed. (12 refs.)

105892 Coupled-channel effects in elastic ^{12}C-^{12}C scattering at 1016 MeV. G.Faldt, A.Ingemarsson (Gustaf Werner Inst., Uppsala, Sweden).
J. Phys. G (GB), vol.9, no.9, p.L191-3 (Sept. 1983).
Coupled-channel calculations for elastic and inelastic scattering of ^{12}C by ^{12}C at 1016 MeV have been performed within the vibration model. (6 refs.)

105893 Origin of the molecular-resonance-like structures in the $^{12}C(^{16}O,\alpha)$ reaction studied by an alpha-HI correlation measurement. T.Shimoda (Lab. of Nuclear Studies, Osaka Univ., Osaka, Japan), S.Shimoura, T.Fukuda, M.Tanaka, H.Ogata, I.Miura, E.Takada, M.-K.Tanaka, K.Takimoto, K.Katori.
J. Phys. G (GB), vol.9, no.9, p.L199-205 (Sept. 1983).
An alpha-HI correlation measurement was performed to see whether the ^{12}C-^{12}C molecular resonance states can be populated in the $^{12}C(^{16}O,\alpha)$ reaction. The cross sections of such processes were small, if any. Instead, the sequential alpha-decay processes of $^{20}Ne^*$ and $^{16}O^*$ mainly contribute to the molecular-resonance-like structures in the alpha spectra. (12 refs.)

105894 Symmetrical fusion of heavy ions around the Coulomb barrier energy. G.Royer, B.Remaud (Inst. de Phys., Nantes, France).
J. Phys. G (GB), vol.9, no.9, p.1103-13 (Sept. 1983).
Using the liquid-drop model, the authors have performed a systematic study of symmetrical fusion with a neck degree of freedom and tunnelling effects, the nuclear potential being calculated with the proximity approach. Barrier heights and positions are in very good agreement with experimental data when they are known (light-medium systems); the recent experimental data for the reactions $^{58}Ni+^{58}Ni$ and $^{64}Ni+^{64}Ni$ are investigated particularly. For heavier systems double-humped fusion barriers and isomeric states are predicted which strongly limit the complete fusion probability. (23 refs.)

105895 The $(^{14}C,^{14}O)$reaction considered as simultaneous pair-exchange or double-charge-exchange processes. D.R.Bes, O.Dragun, E.E.Maqueda (Dept. de Fisica, Comision Nacionale de Energia Atomica, Buenos Aires, Argentina).
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.313-47 (29 Aug. 1983).
Pair-exchange or double-charge-exchange reactions are studied from the point of view of one-step processes. Two possible mechanisms are analyzed, involving either the simultaneous exchange of a dineutron and a diproton between the target and the projectile or the simultaneous transformation of the charge of the dinucleon in each system. Although the formalism is explicitly developed for the $(^{14}C,^{14}O)$ reaction, its extension to other projectiles is straightforward. The possibility of populating collective states which otherwise are very difficult to attain is stressed. Application is made to the cases of the $^{208}Po(^{14}C,^{14}O)^{208}Pb$ and $^{40}Ca(^{14}C,^{14}O)^{40}Ar$ reactions. (14 refs.)

105896 Spectroscopy of $A=16$ from $^{13}C(^{6}Li,t)^{16}O$. K.W.Kemper (Dept. of Phys., Florida State Univ, Tallahassee, FL, USA), G.G.Shute, C.H.Atwood, L.K.Fifield, T.R.Ophel.
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.348-62 (29 Aug. 1983).
The $^{13}C(^{6}Li,t)^{16}O$ reaction has been studied at ^{34} MeV. Selective population of narrow states is observed up to 21 MeV excitation in ^{16}O. This reaction populates strongly both unnatural- and natural-parity states that have little or no $^{12}C+\alpha_0$ width. The measured angular distributions and compared with Hauser-Feshbach and finite-range DWBA calculations. Reasonable agreement with the DWBA calculations is found for most of the states strongly populated. The widths of the narrow states populated in the 16-20MeV excitation region are presented. Comparison of the present data with that from medium-energy inelastic scattering and other multiparticle transfer reactions is made. (32 refs.)

105897 Channel-coupling effects in heavy-ion fusion reactions. C.H.Dasso, S.Landowne (Nordita, Copenhagen, Denmark), A.Winther.
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.381-96 (29 Aug. 1983).
A coupled-channel framework for fusion reactions is considered where an ingoing-wave boundary condition allows the effect of strong coupling in the barrier region to be studied. It is shown analytically within the sudden limit and, more generally, with model calculations that the couplings to reaction channel act to enhance the transmission through the barrier at low energies. This appears to be a natural mechanism for explaining the relatively large sub-barrier heavy-ion fusion cross sections which have recently been observed. (13 refs.)

105898 Mechanism of neon-induced reactions studied between 7.5 and 20 MeV/nucleon: inclusive cross sections. Ch.Egelhaaf, M.Burgel, H.Fuchs, A.Gamp, H.Homeyer, D.Kovar, W.Rauch (Hahn-Meitner-Inst. fur Kernforschung Berlin, Bereich Kern- und Strahlenphys, Berlin, Germany).
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.397-428 (29 Aug. 1983).
Light and projectile-like fragments as well as fission fragments have been observed from the $^{20}Ne+^{197}Au$ system at 150, 220, 290 and 400 MeV beam energy. Inclusive cross sections are given, and characteristic parameters like the centroids and the widths of momentum, *Z*- and *A*- distributions were derived. For comparison, some results of measurements on the $^{22}Ne+^{197}Au$ and $^{20,22}Ne+^{58}Ni$ systems are included. The qualitative behaviour of the cross sections and the derived parameters show that with increasing bombarding energy the incomplete-fusion mechanism (massive transfer) and the sequential decay of projectile transfer residues (sequential break-up) appear in addition to the complete-fusion and ordinary transfer reactions predominant at the lowest bombarding energies. Other mechanisms do not contribute significantly in the energy range up to 20 MeV/nucleon. (71 refs.)

105899 Large-angle $^{6}Li+^{28}Si$ elastic and inelastic scattering at 27 and 34 MeV. M.F.Vineyard, J.Cook, K.W.Kemper (Dept. of Phys., Florida State Univ., Tallahassee, FL, USA).
Nucl. Phys. A (Netherlands), vol.A405, no.2, p.429-44 (29 Aug. 1983).
Elastic and inelastic scattering data extending to $\theta_{c.m}\approx175°$ are reported for $^{6}Li+^{28}Si$ at 27 and 34 MeV. Optical model analyses of the elastic data were made using a variety of real potential forms. The large-angle data cannot be fitted with a Woods-Saxon real potential, but are well described by Wood-Saxon squared, double-folded or Fourier-Bessel potentials. The real potential is the same at both energies, but the imaginary potential is weaker at 27 MeV. The inelastic data were analyzed using the DWBA and coupled channels techniques with folded real form factors and deformed Wood-Saxon imaginary potentials, with the deformations taken from electron scattering. The 2^+ state was fitted well at both energies with the DWBA, while the prediction decreased too rapidly at large angles for the 4^+ state. The large-angle 4^+ data were better described when two-step excitations were included in the coupled-channels calculations. The forward-angle 2^+ data are sensitive to the interference between Coulomb and nuclear scattering and show that the nuclear and Coulomb deformation parameters β_2 are equal for this transition. (28 refs.)

105900 Contribution of two-step processes to the elastic scattering of ^{9}Be on ^{12}C. B.Kamys, L.Jarczyk, Z.Rudy, A.Strzalkowski (Inst. of Phys., Jagellonian Univ., Cracow, Poland), H.H.Wolter, J.Lang, R.Muller, J.Sromicki.
Nucl. Phys. A (Netherlands), vol.A406, no.1, p.193-204 (12 Sept. 1983).
The elastic scattering of ^{9}Be on ^{12}C at energies between 20 and 45 MeV is analysed, taking into account the interference between potential scattering and direct reactions and the incoherent compound nucleus contribution. The direct processes included are the one-step ^{3}He transfer, the two-step inelastic-excitation ^{3}He transfer and the sequential $n\alpha$ transfer. The inelastic scattering and the transfer to the $^{8}Be+^{13}C$ channel are also analysed in order to determine all parameters entering the two-step processes. It is found that the effect of the higher-order processes is to increase the cross section somewhat in the interference angular region, particularly at higher energies. Together with the statistical contribution this leads to a reasonable description of the elastic scattering data. (20 refs.)

105901 Onset of damping in energetic heavy-ion interactions. L.Kowalski, P.E.Haustein, J.B.Cumming (Chem. Dept., Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.642-5 (22 Aug. 1983).
Measurements of longitudinal momenta transferred to mass-identified products of the fragmentation of Cu by ^{12}C ions give clear evidence for a change in reaction mechanism between 22 and 84 MeV/u. Results at 84 MeV/u are generally consistent with peripheral interactions. However, at 22 MeV/u large momentum transfers observed for near-target products suggest that strongly damped processes have become important. Limits to momentum transfer of the type reported by Galin et al. (1982) are shown to arise in a natural way from this transition. (16 refs.)

105902 Nature of molecular resonances and background in the $^{16}O+^{12}C$ system. E.C.Schloemer, M.Gai, J.F.Ennis, M.Ruscev, B.Shivakumar, S.M.Sterbenz, N.Tsoupas, D.A.Bromely (A.W. Wright Nuclear Structure Lab., Yale Univ., New Haven, CT, USA).
Phys. Rev. Lett. (USA), vol.51, no.10, p.881-4 (5 Sept. 1983).
High-resolution total reaction excitation functions for $^{16}O+^{12}C$ and detailed angular distributions for the reaction $^{12}C(^{16}O,\alpha)^{24}Mg$ have been measured. The interplay between (fifteen) resonance amplitudes and *l*-window (background) amplitudes is emphasized. Spin assignments, obtained from the α_0 data, are dominated by values of 8 ħ and 9 ħ while the grazing partial wave varies from $l=5$ to $l=10$ over the energy range studied. Elastic widths for the low-energy resonances indicate a dinuclear molecular nature; higher-energy resonances appear to originate from a more complex nuclear configuration. (12 refs.)

105903 Refractive effects in ^{9}Be scattering and nuclear rainbow ghosts. G.R.Satchler, C.B.Fulmer, R.L.Auble, J.B.Ball, F.E.Bertrand, K.A.Erb, E.E.Gross, D.C.Hensley (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.147-52 (25 Aug. 1983).
Data for the elastic scattering of ^{9}Be on ^{12}C and ^{16}O at 158 MeV provide evidence of refractive effects that allow the optical potentials to be determined with little ambiguity. The real potentials are deep. Large angle data indicate dominance of negative-angle scattering from the far side of the target nucleus. The analysis also implies a residual rainbow phenomenon, contrary to what has been seen previously in heavy-ion scattering. The authors suggest this be called a rainbow ghost. (15 refs.)

105904 Excitation of ^{17}O and ^{18}O scattered by ^{208}Pb in the Coulomb-nuclear interference region. J.S.Lilley, B.R.Fulton (Daresbury Lab., Sci. & Engng. Res. Council, Warrington, England), D.Banes, T.M.Cormier, I.J.Thompson, S.Landowne, H.H.Wolter.
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.153-6 (25 Aug. 1983).
Inelastic scattering of ^{17}O and ^{18}O by ^{208}Pb has been measured at 78 MeV, and compared with theoretical predictions. In both cases the nuclear amplitude is dominated by the valence nucleon contribution. Direct excitation is the principal mechanism in ^{18}O scattering, while for ^{17}O excitation, two-step transfer is more important. Recoil and non-orthogonality effects must be taken into account. (7 refs.)

105905 The absolute normalization of three-nucleon transfer reactions. J.J.Hamill, P.D.Kunz (Nuclear Phys. Lab., Univ. of Colorado, Boulder, CO, USA).
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.5-10 (15 Sept. 1983).
Data for (α,p) and $(^{6}Li,t)$ reactions on ^{40}Ca targets are re-analyzed using microscopic form factors and the DWBA in exact range. The absolute magnitudes predicted for $(^{6}Li,t)$ cross sections agree with data, while the (α,p) cross sections calculated with a deep alpha particle optical model are more than one hundred times smaller than data. The agreement for (α,p) magnitudes is greatly improved when a shallow optical potential is used. (24 refs.)

105906 Charged particle production in peripheral reactions induced by 118 MeV ^{12}C ions on ^{118}Sn. S.E.Arnell, S.Mattsson, H.A.Roth, O.Skeppstedt (Chalmers Univ. of Technol., Goteborg, Sweden), S.A.Hjorth, A.Johnson, A.Kerek, J.Nyberg, L.Westerberg.
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.23-6 (15 Sept. 1983).
The multiplicities of γ-cascades observed in coincidence with fast charged ejectiles from $^{118}Sn+118$ MeV ^{12}C collisions are measured. The analysis gives evidence for a peripheral nature of these reactions and supports the sum-rule model for incomplete (and complete) fusion. (11 refs.)

105907 Analysis of low energy heavy ion multiparticle transfer reactions in terms of entrance and exit doorways. M.U.Ahmed, W.P.Beres (Dept. of Phys., Wayne State Univ., Detroit, MI, USA).
Phys. Rev. C (USA), vol.28, no.2, p.660-6 (Aug. 1983).
A projection operator method is developed for the analysis of low energy heavy ion multiparticle transfer reactions. Entrance doorways introduce structure which is transferred sequentially via reaction (or exit) doorways to the reaction channel of interest. The theory treats both gross and intermediate structure, and the coupling from entrance to exit doorways introduces additional spreading and rather narrow structure in the reaction cross section. Consistent with experiment energy shifts of reaction channel resonances relative to each other and to the elastic are present. The theory is suggested as a means of studying, for example, $^{12}C+^{12}C\rightarrow^{20}Ne^*+\alpha$ in the range of 10-30 MeV (c.m.) where the $O_2{}^+$ state of $^{12}C^*$ would play an important role. (17 refs.)

105908 Dynamical thresholds for compound-nucleus formation in symmetric heavy-ion reactions. K.T.R.Davies (Phys. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), A.J.Sierk, J.R.Nix.
Phys. Rev. C (USA), vol.28, no.2, p.679-91 (Aug. 1983).
The authors study the effect of the nuclear macroscopic energy, nuclear dissipation, and shape parametrization on dynamical thresholds for compound-nucleus formation in symmetric heavy-ion reactions. This is done by solving numerically classical equations of motion for head-on collisions to determine whether the dynamical trajectory in a multidimensional deformation space passes inside the fission saddle point and forms a compound nucleus, or whether it passes outside the fission saddle point and reseparates. Specifying the nuclear shape in terms of smoothly joined portions of three quadratic surfaces of revolution, they take into account three symmetric deformation coordinates. However, in some cases they reduce the number of coordinates to two by requiring the ends of the fusing system to be spherical in shape. The nuclear potential energy of deformation is determined in terms of a Coulomb energy and a nuclear macroscopic energy that is usually taken to be a double volume energy of a Yukawa-plus-exponential folding function, although a double volume integral of a single-Yukawa folding function and ordinary surface energy are also considered. The collective kinetic energy is calculated for incompressible, nearly irrotational flow by means of the Werner-Wheeler approximation. Four possibilities are studied for the transfer of collective kinetic energy into internal single-particle excitation energy: (1) zero dissipation, (2) ordinary two-body viscosity, (3) one-body wall-formula dissipation, and (4) one-body wall-and-window dissipation. (65 refs.)

105909 Reaction cross sections for ^{14}N+^{10}B. P.A.DeYoung, J.J.Kolata, L.J.Satkowiak, M.A.Xapsos (Phys. Dept., Univ. of Notre Dame, Notre Dame, IN, USA).
Phys. Rev. C (USA), vol.28, no.2, p.692-9 (Aug. 1983).
Excitation functions for the yields of nineteen residual nuclei from the the ^{14}N+^{10}B reaction have been measured over the range $E_{c.m.}$=8.00-25.75 MeV in steps of 250 keV with γ-ray techniques. The magnitude and energy dependence of the excitation functions for the partial yields are very different from those of the ^{12}C+^{12}C system. The total fusion cross section appears to saturate at an energy and a magnitude which are lower than expected from previous systematics. Small, regular fluctuations can be seen in the fusion cross section, one of which is very narrow. However, the structure observed by L'Ecuyer et al. was not seen in this work. (15 refs.)

105910 Energy dependence of ^{9}Be+^{12}C cross sections: nonstatistical component of the mean cross section. L.Jarczyk, B.Kamys, Z.Rudy, A.Strzalkowski, H.Witala (Inst. of Phys., Jagellonian Univ., Cracow, Poland), M.Hugi, J.Lang, R.Muller, J.Sromicki, H.H.Wolter.
Phys. Rev. C (USA), vol.28, no.2, p.700-5 (Aug. 1983).
The mean cross section for the elastic scattering and the ^{8}Be and the α-particle channels in the ^{9}Be+^{12}C system considerably exceeds the Hauser-Feshbach model predictions for the compound nucleus cross section. It is shown that the magnitude as well as the energy and angle dependence of this nonstatistical contribution to the mean cross section can be explained satisfactorily as being produced in a direct transfer reaction. One step ^{3}He, n, and α transfer processes are adequate for the description of the ^{9}Be and ^{8}Be channel while a contribution of two-step sequential processes should be taken into account for the ^{5}He and ^{8}Be transfers in the α-particle exit channel. (24 refs.)

105911 Total inclusive neutron cross sections and multiplicities in nucleus-nucleus collisions at intermediate energies. R.Madey, B.D.Anderson, R.A.Cecil, P.C.Tandy (Dept. of Phys., Kent State Univ., Kent, OH, USA), W.Schimmerling.
Phys. Rev. C (USA), vol.28, no.2, p.706-9 (Aug. 1983).
The total integrated inclusive cross section, $\sigma(T>T_0)$, for the emission of neutrons above an energy T_0 by neon ions with an average energy of 337 MeV per nucleon reacting in targets of uranium, copper, aluminum, and carbon is described by $\bar{\sigma}_{NN}(\bar{R}_G/r_0)^{\alpha(T0)}$. Here $\bar{\sigma}_{NN}$ is the isospin-averaged nucleon-nucleon cross section evaluated at an energy equal to the bombarding energy per nucleon, and R_G is the arithmetic mean value of the radii of the projectile and the target measured in units of the radius parameter r_0(=1.2 fm). In the limit $T_0=0$, the exponent $\alpha(T_0)=5$. A useful formula is derived for calculating mean neutron multiplicities in nucleus-nucleus collisions. (16 refs.)

105912 ^{12}C on ^{48}Ca transfer reactions: a test of the effective *Q*-value model. J.F.Petersen (A.W. Wright Nuclear Structure Lab., Yale Univ., New Haven, CT, USA), R.J.Ascuitto, D.G.Kovar, W.Henning, S.J.Sanders.
Phys. Rev. C (USA), vol.28, no.2, p.710-16 (Aug. 1983).
Angular distributions for the ^{48}Ca(^{12}C,^{11}B)^{49}Sc and ^{48}Ca(^{12}C,^{13}C)^{47}Ca transfer reactions at E_{lab}=45 MeV are presented. The data are analyzed in the context of the effective *Q*-value model, which has previously been applied successfully to ^{16}O induced reactions on ^{48}Ca. The model accounts equally well for the observed behaviors of the ^{12}C+^{48}Ca system, provided the influence of the strong inelastic transition to the first excited 2^+ (4.43 MeV) state in ^{12}C is taken into account. (15 refs.)

105913 Elastic scattering of ^{16}O by ^{28}Si. V.Shkolnik, D.Dehnhard, M.A.Franey (J.H. Williams Lab. of Nuclear Phys., Univ. of Minnesota, Minneapolis, MN, USA).
Phys. Rev. C (USA), vol.28, no.2, p.717-34 (Aug. 1983).
Differential cross sections were measured in small angular steps at forward angles for the elastic scattering of ^{16}O from ^{28}Si, ^{29}Si and ^{30}Si at E_{lab}=60 MeV and from ^{28}Si at six other incident energies between 45 and 63 MeV. The angular position of a peak in the diffraction pattern at $\theta_{c.m.}\simeq 75°$ was measured as a function of the incident energy between 55 and 63 MeV in 0.5 MeV steps. Close fits to these angular distributions and those of other authors at energies between 41 and 81 MeV, some spanning the whole angular range up to 180°, and the excitation functions at 90° and 180°, were obtained in an optical model analysis. A consistent description of the data was found by the use of a surface-transparent and parity-dependent potential with a real part able to generate a pocket in the total potential. The real and imaginary strengths depend quite strongly and smoothly on the incident energy. This potential shows a transition from surface transparency to strong absorption as E_{lab} approaches 81 MeV. The ambiguities in the strengths of the potential are discussed. The broad dispersive potential resonances which are present in several partial waves at every energy are also discussed and their relative importance is examined. (60 refs.)

105914 Intermediate-structure resonances in the ^{16}O+^{16}O total reaction cross section. W.Tiereth, Z.Basrak, H.Voit, N.Bischof, R.Caplar, P.Duck, H.Frohlich, B.Nees, E.Nieschler, W.Schuster (Phys. Inst., Univ. Erlangen-Nurnberg, Erlangen, Germany).
Phys. Rev. C (USA), vol.28, no.2, p.735-8 (Aug. 1983).
The ^{16}O+^{16}O total reaction cross section has been deduced from the elastic data in the energy region from 15.5-18 MeV (c.m.) using the sum-of-differences method. It exhibits intermediate-width resonant structures which are attributed to quasimolecular resonances in the A=32 system. Reduced partial widths of three resonances have been calculated. They indicate that the structure of the resonant states may not be that of a dinuclear molecule. (19 refs.)

105915 Influence of the nuclear autocorrelation function on the positron production in heavy-ion collisions. T.Tomoda, H.A.Weidenmuller (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
Phys. Rev. C (USA), vol.28, no.2, p.739-46 (Aug. 1983).
The influence of a nuclear reaction on atomic positron production in heavy-ion collisions is investigated. Using statistical concepts, the authors describe the nuclear S matrix for a heavy-ion induced reaction as a statistically fluctuating function of energy. The positron production rate is then dependent on the autocorrelation function of this S matrix, and on the ratio of the 'direct' versus the 'fluctuating' part of the nuclear cross section. Numerical calculations show that in this way, current experimental results on positron production in heavy-ion collisions can be reproduced in a semiquantitative fashion. (10 refs.)

105916 Fission following capture reactions of ^{32}S+^{208}Pb. M.B.Tsang, D.Ardouin, C.K.Gelbke, W.G.Lynch, Z.R.Xu (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA), B.B.Back, R.Betts, S.Saini, P.A.Baisden, M.A.McMahan.
Phys. Rev. C (USA), vol.28, no.2, p.747-60 (Aug. 1983).
Fission fragment mass and angular distributions were measured for ^{32}S induced reactions on ^{208}Pb at the laboratory energies of 180, 210, 250, and 266 MeV. By measuring the folding angle distributions between coincident fissionlike fragments at several beam energies it is shown that essentially the entire mass of the projectile is transferred to the composite system, which subsequently decays via symmetric fission. With increasing projectile energy the width of the mass distribution increases approximately as the square root of the nuclear temperature. The energy dependence of the angle integrated fusion-fission cross sections can be well described by classical trajectory calculations using the proximity potential and one-body dissipation. The fission fragment angular distributions become more anisotropic with increasing beam energy. Even at the lowest energy of 180 MeV, the angular distributions are more anisotropic than expected from statistical model calculations using saddle point shapes of the rotating liquid drop model. A simple parameterization of the angular momentum dependence of the effective moment of inertia gives a consistent description of the energy dependence of the angular distributions. (38 refs.)

105917 Tensor interactions and projectile excitations in the scattering of ^{7}Li by ^{58}Ni. H.Ohnishi, M.Tanifuji (Dept. of Phys., Hosei Univ., Tokyo, Japan), M.Kamimura, M.Yahiro, Y.Sakuragi.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.299-303
Elastic and inelastic scattering of polarized ^{7}Li by ^{58}Ni targets at E_{lab}=20.3 MeV is investigated in two ways; namely, the invariant-amplitude method and the coupled-channel method. (4 refs.)

105918 Two-step contributions and non-orthogonality effects in deuteron and ^{17}O reactions on lead. I.J.Thompson (Sci. & Engng. Res. Council, Daresbury Lab., Warrington, England).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.348-56
A numerically stable and accurate method to calculate non-orthogonality terms has been incorporated in a general coupled-channels program that allows finite range transfer couplings between any number of light or heavy ions. The non-orthogonality terms have been calculated for the two-step transfer contributions to deuteron elastic scattering and to ^{17}O inelastic scattering on lead, at energies near the Coulomb barrier. It is found that the sequential amplitudes through the weekly bound states in ^{209}Pb are especially affected, as these amplitudes are over-estimated by between 30% and 150% in simple post-prior calculations. These effects are observable because the more direct processes are not too strong, and a good fit is now obtained to the data of Lilley et al. (22 refs.)

105919 Breakup effects of ^{7}Li on the elastic and inelastic scatterings. K.Katori, T.Shimoda, T.Fukuda (Lab. of Nuclear Studies, Osaka Univ., Osaka, Japan), S.Shimoura, A.Sakaguchi, T.Yamagata, M.Tanaka, H.Ogata, Y.Sakuragi, M.Kamimura.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.635-8
The differential cross sections for the elastic and inelastic scattering of 132 MeV ^{7}Li from ^{12}C can be well described by coupled-channel calculations taking into account the breakup effect of ^{7}Li. (3 refs.)

105920 ^{12}C→3α breakup effect on ^{12}C+^{12}C scattering at E_{LAB}=140~300 MeV studied by microscopic coupled channels methods. Y.Sakuragi (Dept. of Phys., Kyushu Univ., Fukuoka, Japan), Y.Fukushima, M.Kamimura.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.639-44 (9 refs.)

105921 Sequential projectile-breakup process in ^{20}Ne induced reactions at 92, 149 and 213 MeV. T.Shimoda, K.Katori (Lab. of Nuclear Studies, Osaka Univ., Osaka, Japan), T.Fukuda, H.Ogata, S.Shimoura, E.Takada.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.645-8
The authors have studied the energy dependence of the direct and sequential breakup processes of the ^{20}Ne induced reactions in coincidence measurements of ^{40}Ca, ^{208}Pb(^{20}Ne,α^{16}O) at 92, 149 and 213 MeV. (7 refs.)

105922 Macroscopic implications of (N,Z) distributions for reaction mechanisms in ion-ion collisions. J.J.Griffin (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.761-73
Discrete Random Walk calculations of the (N-Z) evolution of a liquid drop dinucleus are reported for various assumptions about the transfer dynamics. Transition probabilities are assumed which correspond to the transferred nucleons being able to reach (a) any energy conserving state of the final dinucleus, (b) any energy conserving state more complicated by not more than 1p and 1h than the initial state, and (c) any one-particle one-hole excitation of the initial state. Physically these assumptions correspond to restricting the transfer, not at all, somewhat, and totally to be a pure one-body process. In every case, the Pauli exclusion principle is honored in the allowed final states. One finds that the assumption (c) generally leads to predictions easily distinguishable from those of (a) and (b), which do not differ substantially. (17 refs.)

105923 Pre-equilibrium effects in heavy-ion induced reactions. K.Niita (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.786-94
Proposes a master equation to describe the time evolution of the intrinsic state during heavy-ion collisions. It takes into account two different kinds of processes. One is the relaxation of the relative motion, and the other is the equilibration process of the excited nuclei. The author then calculates the energy spectrum of the emitted nucleon. The angular distribution is also calculated using phase-space considerations. (12 refs.)

105924 Fragmentation processes in nucleus-nucleus collisions. G.Baur (Inst. fur Kernphys., KFA Julich, Julich, Germany).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.795
Abstract form only given. A review of fragmentation processes in nuclear collisions is given. There are two types of DWBA-matrix elements which describe different physics: one, where the projectile as a whole is excited to an unbound (continuum) state which decays subsequently (sequential break-up), another one, where a constituent of the projectile is directly knocked out in a quasifree reaction (spectator break-up). The relative importance of these mechanisms is estimated semiclassically for Coulomb- and nuclear collisions. The direct measurement of the deuteron polarizability in subcoulomb elastic scattering is discussed. It constitutes a definite signature of the presence of intermediate break-up states in elastic scattering: due attention has to be paid to other small effects like vacuum polarization, electron screening and nuclear effects. (3 refs.)

105925 Light particle emission in the reaction of $^{93}Nb+^{14}N$ at 132, 159 and 208 MeV. T.Fukuda (Dept. of Phys., Osaka Univ., Osaka, Japan), M.Ishihara, H.Ogata, I.Miura, T.Shimoda, K.Katori, S.Shimoura, M.-K.Tanaka, E.Takada, T.Otsuka.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.796-805
Describes a systematic study of the inclusive measurement of energetic light particle emission of p, d, t, α in the reactions of $^{93}Nb+^{14}N$ at 132, 159 and 208 MeV. The light particle spectra are discussed in terms of three models: (i) an extended exciton model in which the finiteness of the time needed for the fusion process is included, (ii) a generalized coalescence model which takes into account the Coulomb repulsion from the target nucleus, and (iii) a moving thermal source model. (9 refs.)

105926 Potential model description of heavy ion scattering using spline techniques. A.M.Kobos, R.S.Mackintosh (Open Univ., Milton Keynes, England).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.12-24
Discusses the spline model inversion procedure and its application to heavy ion scattering potential models. The reactions $^{16}O+^{40}Ca$, $^{16}O+^{28}Si$ and $^{6}Li+^{12}C$ are analysed. (8 refs.)

105927 Folding models for elastic and inelastic scattering. G.R.Satchler (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.25-43
Discusses folding procedures and their application to the elastic and inelastic scattering of heavy ions from nuclei. (42 refs.)

105928 Different regimes of dissipative collisions. A.Gobbi (Gesellschaft fur Schwerionenforschung, Darmstadt, Germany).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.159-74
The author discusses three topics: the energy dissipation under the influence of the single particle shell structure, large rearrangement of masses during the fusion process, and the dynamical splitting of heavy nuclei ($A>86$) at incident energies of 12-15 MeV/u. (22 refs.)

105929 Charge equilibration in deep-inelastic peripheral collisions. D.H.E.Gross, K.M.Hartmann (Bereich Kern- und Strahlenphys., Hahn-Meitner-Inst. fur Kernforschung, Berlin, Germany).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.175-84
Deep-inelastic collisions between heavy ions are being used to study the relaxation of various macroscopic degrees of freedom. These include mass, charge, scattering angle, angular momentum and shape. The energy loss undergone during the reaction is usually employed as the time scale. No theory exists as yet which combines quantal fluctuations with stochastic ones. The authors develop a model, appropriate for peripheral collisions, which treats rigorously, at a microscopic level, both quantal and classical contributions to the fluctuation. (13 refs.)

105930 Neutron-proton asymmetry and fast fission: two extreme time evolutions in dissipative heavy ion reactions. C.Ngo (DPh-N/MF, CENS, Gif-sur-Yvette, France).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.185-219
Reviews two different phenomena occurring in dissipative heavy ion collisions: neutron-proton asymmetry and fast fission. The first one is very fast and exhibits quantum fluctuations. The second one is very slow and dominated by statistical fluctuations. A dynamical model treating both these processes is also described. (21 refs.)

105931 Fusion and compound nuclei decay for light and intermediate-mass systems: ^{24}Mg, $^{28}Si+^{12}C$; $^{24}Mg+^{24,26}Mg$; $^{28}Si+^{24}Mg$, $^{28,29,30}Si$. S.Gary, C.Volant (DPh-N/BE, CENS, Gif-sur-Yvette, France).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.327
Astract form only given. Complete fusion or residue distributions have been measured with several experimental techniques for the following systems: ^{24}Mg, $^{28}Si+^{12}C$; $^{24}Mg+^{24,26}Mg$; $^{28}Si+^{24}Mg$, $^{28,29,30}Si$. The range of energies spreads from 1 to 3 times the Coulomb barrier. None of these systems presents structures in its fusion excitation function as pronounced as the ones observed for lighter entrance channels. The intensities of the residue distribution are generally in agreement with the predictions of the multiple deexcitation code CASCADE. The shape and absolute values of complete excitation functions are compared to macroscopic models and to the predictions of a coupled-channel approach of the reaction, which gives a more satisfactory account of experimental data. (no refs.)

105932 Nuclear 'molecular' states. U.Mosel, O.Tanimura, R.Wolf (Inst. fur Theoretische Phys., Univ. Giessen, Giessen, Germany).
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.328-50
In the first part some models for the description of inelastic scattering of light heavy ions are discussed based on a reaction-theoretical approach. In the second part, the structure aspects of a nucleus-nucleus collision are treated based on an analysis of two center correlation diagrams. (34 refs.)

105933 Spectroscopy of superheavy quasimolecules and quasiatoms. U.Muller, N.Aboul-El-Naga, J.Reinhardt, T.de Reus, P.Schluter, M.Seiwert (Inst. fur Theoretische Phys., Johann Wolfgang Goethe-Univ., Frankfurt am Main, Germany), G.Soff, K.H.Wietschorke, B.Muller, W.Greiner.
Heavy-Ion Collisions. Proceedings of the International Summer School, La Rabida, Spain, 7-18 June 1982 (Berlin, Germany: Springer-Verlag 1982), p.388-425
Collisions of very heavy ions at energies close to the Coulomb barrier are discussed as a unique tool to study the behaviour of the electron-positron field in the presence of strong external electromagnetic fields. Theoretical predictions for K-hole production, δ-electron and positron emission rates are compared with experimental results. Emphasize is laid on effects due to nuclear reactions close to the Coulomb barrier. Internal electron-positron pair production from electric monopole transitions is investigated for atoms with charge numbers up to $Z\simeq170$. The effect of field theoretical corrections to the binding energy of the deepest bound state, here the self-energy, is also discussed. (64 refs.)

25.80 MESON- AND HYPERON-INDUCED REACTIONS AND SCATTERING

105934 Systematics of pion double-charge-exchange reactions on $T=0$ nuclei. L.C.Bland, R.Gilman, M.Carchidi, K.Dhuga (Univ. of Pennsylvania, Philadelphia, PA, USA), C.L.Morris, H.T.Fortune, S.J.Greene, P.A.Seidl, C.F.Moore.
Phys. Lett. B (Netherlands), vol.128B, no.3-4, p.157-9 (25 Aug. 1983).
Pion induced double charge exchange on ^{12}C, ^{16}O, ^{24}Mg, ^{28}Si, ^{32}S, and ^{40}Ca exhibits forward-angle cross sections that vary rapidly with pion energy and fall off roughly as $A^{-4/3}$. Angular distributions at 164 MeV appear diffractive for targets of ^{12}C, ^{16}O, and ^{40}Ca. (6 refs.)

105935 Isovector $M2$ state observed in the $^{14}C(\pi^-,\gamma)$ reaction. H.W.Baer (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA), J.A.Bistirlich, K.M.Crowe, W.Dahme, C.Joseph, J.P.Perroud, M.Lebrun, C.J.Martoff, U.Straumann, P.Truol.
Phys. Rev. C (USA), vol.28, no.2, p.761-71 (Aug. 1983).
The photon spectrum of the pion capture reaction $^{14}C(\pi^-,\gamma)^{14}B$ was measured with a resolution of 0.9 MeV full width at half maximum. A single strong transition is observed with γ-ray energy 115.70 ± 0.17 MeV, corresponding to a state in ^{14}B at 2.15 ± 0.17-MeV excitation. Comparisons with previous experiments and theoretical calculations identify this as the second $T=2,2^-$ state in mass-14 nuclei. The single strong transition has a measured branching ratio $(11.1\pm3.0)\times10^{-4}$, which equals one-fifth of the shell-model prediction. The total radiative capture branching ratio is $0.68\pm0.16\%$, which is a factor of 2 to 3 smaller than for other 1-p-shell nuclei. (35 refs.)

105936 K^+ and K^- elastic scattering within the framework of multiple scattering theory. A.Chaumeaux, M.-C.Lamaire (Dept. de Phys. Nucleaire/Moyennes Energies, CENS, Gif-sur-Yvette, France).
Phys. Rev. C (USA), vol.28, no.2, p.772-84 (Aug. 1983).
$^{12}C(K^{\pm},K^{\pm})$ and $^{40}Ca(K^{\pm},K^{\pm})$ 800 MeV/c elastic scattering data are analyzed within the framework of Kerman-McManus-Thaler theory. To that purpose the elementary t matrix is derived directly from the $K^{\pm}N$ experimental observables. The relative sensitivity of K^+, K^-, and 1 GeV protons to the neutron density distribution is investigated. (39 refs.)

105937 Delta-nucleon and pion-nucleus interactions. M.Hirata (Swiss Inst. for Nuclear Res., Villigen, Switzerland), F.Lenz, M.Thies.
Phys. Rev. C (USA), vol.28, no.2, p.785-810 (Aug. 1983).
The effect of the Δ-N interaction in elastic and inelastic pion scattering is discussed. In elastic scattering, the two-body Δ-N interaction generates both Δ self-energy and Δ-h vertex corrections. The relative importance of these two kinds of medium corrections is discussed analytically. Numerical calculations are presented which show in detail the role of the Δ-N interaction in elastic

scattering. In pion-nucleus inelastic scattering, a new reaction mechanism appears due to the two-body nature of the Δ-N interaction. The qualitative characteristics of these processes induced by Δ-N collisions are discussed. Deviations from quasifree isospin ratios in knockout reactions and excitations of specific nuclear levels are signatures of the interference between processes generated by the π-N and Δ-N interaction, respectively. In the formalism presented, the order of magnitude of these modifications can be related to the size of the experimentally observed true pion absorption cross sections. (19 refs.)

105938 On the production of the six-quark H dibaryon in the (K^-,K^+) reaction. A.T.M.Aerts, C.B.Dover (Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. D (USA), vol.28, no.3, p.450-63 (1 Aug. 1983).
The authors investigate several ways of producing the stable doubly strange six-quark dibaryon H predicted by the MIT bag model. Various kinematical and dynamical arguments indicate that the (K^-,K^+) double-strangeness-exchange reaction on nuclear targets affords the best chance for observing the H. Cross sections for the prototype reaction $^3He(K^-,K^+n)H$ are calculated, using empirical data on the reaction $K^-p \rightarrow K^+\Xi^-$ as input, as well as an oscillator model for the quark-fusion process $\Xi^-p \rightarrow H$. The spectrum for the quasielastic process $^3He(K^-,K^+)n\Xi^-p$ is also calculated. For coincidence experiments involving both K^+ and neutron detection at forward angles, the cross section for H production ranges from 10-30 nb/sr^2 for K^- beam momenta between 1.4 and 2.2 GeV/c. If the H lies below the $\Lambda\Lambda$ threshold, it can be nicely separated from the K^+ quasielastic background, although π^+'s misidentified as K^+'s can be a problem for certain H masses. If only the K^+ is detected, the separation of the H signal ($\approx$0.5 μb/sr) from the quasielastic background can be achieved through a careful measurement of the K^+ momentum spectrum. They assess the effects on their results of the rapid momentum dependence in the $K^-p \rightarrow K^+\Xi^-$ reaction, as well as short-range correlations in the ^{3}He wave function. (35 refs.)

25.85 FISSION REACTIONS

105939 Delayed neutron yield and decay constants for thermal neutron-induced fission of ^{235}U. S.Synetos (Imperial Coll. of Sci. & Technol., London, England), J.G.Williams.
Nucl. Energy (GB), vol.22, no.4, p.267-74 (Aug. 1983).
Delayed neutron yield and decay constants were measured using foils of ^{235}U irradiated in a thermal column of the University of London Reactor. After each irradiation the delayed neutron emission rate was measured in a detector consisting of a water bath containing BF_3 counters. The number of fissions in the foils was measured using a gamma spectrometer to determine their ^{140}La activity, relative to that of calibration foils irradiated in an absolute fission chamber. The measured delayed neutron decay curve was fitted to the sum of five exponential groups by the least squares method. The total yield of the five groups was 0.0151±0.0007 delayed neutrons per fission. When the six group parameters of Keepin and Wimett (1965) were used together with the total counts observed in this experiment the total yield found for the six groups was 0.0156±0.0010, where the difference from the previous value is attributable to the presence of the sixth group. The period-reactivity relationship was calculated for positive periods between 0.2 and 900 s using both the five-group data and the six-group data. (16 refs.)

105940 Energy dependence of fission fragment angular distributions for ^{19}F, ^{24}Mg and ^{28}Si induced reactions on ^{208}Pb. M.B.Tsang, H.Utsunomiya, C.K.Gelbke, W.G.Lynch (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA), B.B.Back, S.Saini, P.A.Baisden, M.A.McMahan.
Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.18-22 (15 Sept. 1983).
The energy dependence of fission fragment angular distributions was measured for reactions induced by ^{19}F, ^{24}Mg, and ^{28}Si on ^{208}Pb over the range of incident energies of E/A=5.6-10 MeV. For all three systems the angular distributions are inconsistent with the saddle point deformations of the rotating liquid drop model. (14 refs.)

25.88 FUSION REACTIONS

105941 Emission of high-energy charged particles in incomplete-fusion reactions. C.V.Christov, I.I.Delchev, I.J.Petkov (Inst. of Nuclear Res. & Energy, Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.5, p.603-6 (1983).
The authors consider the emission of high-energy α-particles within the framework of a model based on a simple quantum mechanical approach to the transfer process in which, however, the fusion process is included as an essential stage. They analyse reactions of the type $A+B \rightarrow \alpha+(x+B)$ where an α-particle is emitted from the projectile A and the fragment $_x$ fuses into the target B. The physical picture they accept supposes the formation of a $x-B$ nuclear quasimolecule in accordance with a complete-fusion model. (8 refs.)

105942 Rate of nuclear fusion reaction in a magnetoplasma. O.Aono (Dept. of Phys., Jichi Medical School, Yakushiji, Tochigi, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2610 (July 1983).
A recent paper by S. Imazu (see ibid., vol.51, p.2999, 1982) shows that the rate of nuclear fusion reaction in a magnetoplasma decreases as the field increases. However, a more careful treatment reveals the reaction rate to be independent of the magnetic field. (1 ref.)

105943 Reply to the comment 'Rate of nuclear fusion reaction in a magnetoplasma'. S.Imazu (Dept. of Electrical Engng., Technol. Univ. of Nagaoka, Niigata, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2611 (July 1983).
For comment see ibid., vol.52, p.2610 (1983). The author states that when the direction of the relative velocity of particles changes with the time t, the effect of the magnetic field on the number of collisions appears for $\omega t > 1$. (no refs.)

105944 Fusion near and below the barrier for the systems ^{32,34}S+^{24,25,26}Mg and ^{32}S+^{27}Al. G.M.Berkowitz, P.Braun-Munzinger, J.S.Karp, R.H.Friefelder, T.R.Renner, H.W.Wilschut (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. C (USA), vol.28, no.2, p.667-78 (Aug. 1983).
Excitation functions are reported for total fusion near and below the Coulomb barrier of the systems ^{32,34}S+^{24,25,26}Mg and ^{27}Al. The data cannot be reproduced by one-dimensional barrier penetration calculations. The enhancement of the cross sections at low energies is compared to predictions of models taking into account the static deformation or zero point vibration of the reaction partners. Calculations including zero point motion do not reproduce the observed variations of the measured cross sections with respect to the neutron number of target and projectile. Reasonable agreement is obtained when calculating fusion between statically deformed nuclei. Finally, the fusion process is described in a quantum mechanical coupled channels model, indicating the importance of dynamical effect on sub-barrier fusion. (21 refs.)

28.00 NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES

(see also 86.10 Energy resources and their utilisation)

105945 Finding the flaws in nuclear power plants. E.Herbert.
IEEE Spectrum (USA), vol.19, no.9, p.56-61 (Sept. 1982).
Research and development sponsored by the Electric Power Research Institute in Palo Alto, California, has led to new nondestructive evaluation techniques. These include: a high-energy, portable X-ray system for ensuring the integrity of thick metal reactor vessels and coolant pumps, ultrasonic methods to enable reliable detection and characterization of corrosion-induced cracks in pipes, advanced eddy-current inspection equipment for steam generator tubing and automated inspection and evaluation systems capable of reducing plant downtime. (no refs.)

28.41 FISSION REACTOR THEORY AND DESIGN

105947 Optimal flux distribution in slab reactors with a uniform external source. J.Vitela E., A.Z.Akcasu (Dept. of Nuclear Engng., Univ. of Michigan, Ann Arbor, MI, USA).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.5, p.359-65 (May 1983).
The problem of optimal flux distribution for maximum power in bare slab reactors with a uniform external source and maximum flux constraint, is solved using an optimal control formalism for the case of the one group neutron diffusion approximation. A set of optimal solutions, which depend on the magnitude of the external source, the upper and lower limit of the control variable and the maximum flux allowable in the reactor, is obtained. The results corresponding to a critical reactor are included here, as a particular case. A numerical example is used to illustrate the parametric dependence of the solutions. (4 refs.)

105948 Extension of fission product model for use in lattice calculation of thorium fueled BWR. T.Yamamoto, T.Takeda (Dept. of Nuclear Engng., Osaka Univ., Suita, Japan), T.Yoshida, S.Iijima.
J. Nucl. Sci. & Technol. (Japan), vol.20, no.6, p.523-5 (June 1983).
The authors apply the fission product model for BWR lattice calculations to a Th fueled BWR, and discuss its applicability. (5 refs.)

105949 A fuel-ringed external irradiation cavity for the annular core research reactor. J.A.Reuscher, T.F.Luera (Sandia Nat. Lab., Albuquerque, NM, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.12-14 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The annular core research reactor (ACRR) consists of a water-moderated core of 236 uniquely designed BeO-UO$_2$ fuel elements arranged in a hexagonal grid around a 22.8-cm-diam, dry, irradiation cavity. The reactor is utilized for a wide variety of radiation effects and advanced reactor safety research programs. The flexible reactor control system can be programmed to provide a variety of operating modes, including single pulses, multiple pulses, square wave, ramp, steady state, or a combination of these modes. Experiments with a diameter >22.8 cm have required the installation of a 38-cm-diam. external cavity adjacent to the core to achieve the proper fluence-volume capability. An initial external cavity without surrounding fuel was installed and used for experiments; however, the fluence distribution across this cavity had neither sufficient magnitude nor uniformity, so another cavity with a surrounding neutron multiplier was designed and fabricated. This paper describes the design and performance characteristics of the ACRR fuel-ringed external cavity (FREC). (1 ref.)

105950 Calculational procedures used to extend MITR-II fuel burnup. J.Bernard, K.Kwok, D.Lanning, L.Clark (MIT, Cambridge, MA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.14-15 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
This paper describes calculational and experimental methods developed to extend fuel burnup at the Massachusetts Institute of Technology's 5-MW(th) research reactor, MITR-II. This report complements an earlier one which discussed element rotation and inversion as a means of increasing fuel depletion. (4 refs.)

105951 CORE-MASTER—the ASEA-ATOM boiling water reactor core analysis system. S.-O.Lindahl (AB ASEA-ATOM, Vasteras, Sweden).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.87-8 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
To provide power utilities with independent capability to perform extensive on-line and off-line core calculations in support of reactor operation and for in-core fuel management (ICFM), an integral program package has been designed. It is based on codes that have long been applied in core design and tracking. The program system, termed CORE-MASTER, is implementable on a variety of powerful minicomputers. The on-line core surveillance mode is directed toward the reactor operator for enabling flexible and safe operation, while the off-line use is intended for the nuclear engineering personnel for day-to-day operations analysis and optimization of fuel usage. (4 refs.)

105952 MORSE-E1, source and analysis routines to be used with the MORSE code. C.Ponti, R.Van Heusden.
Report EUR 8420 EN, Comm. European Communities, Luxembourg (1983), 9 pp.
Describes the content and the use of a set of source and analysis routines to be used with the MORSE code. Uniformly distributed sources within simple geometrical shapes are implemented in the package. It calculates the flux of particles as the sum of the path travelled within a given volume; the corresponding relative errors are also provided. Particle currents through surfaces may also be computed. The MORSE-E1 package enables the user to solve many problems without further programming work. (4 refs.)

105953 EURDYN: Computer programs for the nonlinear transient analysis of structures submitted to dynamic loading. EURDYN (Release 3): Users' manual. J.P.Halleux.
Report EUR 8357 EN, Comm. European Communities, Luxembourg (1983), 152 pp.
A user manual for the EURDYN-3 computer code for nonlinear analysing of structures under dynamic loading is presented.

105954 TPLOT: An interactive time plot system for transient structural problems. J.P.Halleux.
Report EUR 8391 EN, Comm. European Communities, Luxembourg (1983), 42 pp.
Efficient use of modern computer programs (finite element or finite difference) for structural analysis requires availability of powerful pre- and post-processing capabilities. Plotting facilities are needed as well in the input phase for verifying the mesh f.i., as in the output phase for analysing the results (deformed shapes, isocurves, strain and stress profiles). In dynamic problems there is a further interest in obtaining time plots, i.e. visual representation of the variation of a local quantity in time. The present report describes the use of a time plot system TPLOT available for interactive post-processing of EURDYN 01, 02, 03, EURDYN-1M, SEURBNUK-2, ASTARTE and experimental results of the COVA tests (PLURIMAT-S and HP-1000). (8 refs.)

105955 MUP, CEC-DES, STRADE. Codes for uncertainty propagation, experimental design and stratified random sampling techniques. A.Amendola, M.Astolfi, B.Lisanti.
Report EUR 8244 EN, Comm. European Communities, Luxembourg (1983), 115 pp.
The report describes how to use the codes: MUP (Monte Carlo Uncertainty Propagation) for uncertainty analysis by Monte Carlo simulation, including correlation analysis, extreme value identification and study of selected ranges of the variable space; CEC-DES (Central Composite Design) for building experimental matrices according to the requirements of Central Composite and Factorial Experimental Designs; and STRADE (Stratified Random Design) for experimental designs based on the Latin Hypercube Sampling Techniques. Application fields of the codes are probabilistic risk assessment, experimental design, sensitivity analysis and system identification problems. (13 refs.)

105956 Modeling of natural circulation phenomena in nuclear reactor cooling loops. Y.Zvirin, Y.Rabinoviz.
Report EPRI-NP-2951, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 148 pp.
Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.
This report discusses the development of a steady-state and transient computer code to analyze single-phase natural circulation in multiple-loop PWRs with either U-tube or once-through steam generators. The code is compared with experimental data. In addition, the results of applying the code to sensitivity studies of the major parameters involved are presented.

28.42 FISSION REACTOR MATERIALS

105957 Experience with the construction of a reactor safety containment using 15 MnNi 63. W.Backfisch, W.Clauss, E.Dittemer, E.Klaiber (Technischer Uberwachungs-Verein EV, Mannheim, Germany).
VGB Kraftwerkstech. (German Ed.) (Germany), vol.63, no.6, p.532-7 (June 1983). In German.
As an introduction the design criteria and the licensing and technical regulatory constraints are considered. Because of the principal requirement—high material toughness in all conditions of stress or operation—the low alloy stee, 15 MnNi 63 with a minimum yield strength of 370 N/mm^2 has been used as a material for a reactor safety containment. No suspect circumstances arose during the manufacture of the containment. Subsequent pressure and leak-proof testing proceeded without problems. The expansion measurements carried out during this also produced no unacceptable local plastifications even at points of high stress. (5 refs.)

105958 Modelling the effect of diffusion into the rock matrix on radionuclide migration. D.A.Lever, M.H.Bradbury, S.J.Hemingway (Theoretical Phys. & Chem. Technol. Div., AERE, Harwell, England).
Prog. Nucl. Energy (GB), vol.12, no.1, p.85-117 (1983).
Diffusion into the rock matrix is potentially an important retardation mechanism for nuclides leached from an underground radioactive waste repository in a fractured hard rock. Models of this diffusion process are discussed and incorporated into three-dimensional radionuclide migration models. Simple solutions to these models are derived for two regions: the region near to the repository where the nuclide is diffusing into effectively infinite rock, and that much further downstream where the concentrations in the rock and fractures are almost in equilibrium. These solutions are used to evaluate the possible impact on migration. It is shown that retardation factors in excess of 100 and reductions in the peak concentration at a given point on the flow path by three or four orders of magnitude are possible for non-sorbed ions, which would otherwise be carried by the flow and not retarded at all. (46 refs.)

105959 Application of ion implantation and backscattering techniques to the analysis of nuclear waste glass corrosion. B.C.Sales, C.W.White, L.A.Boatner (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Mater. Lett. (Netherlands), vol.2, no.1, p.1-5 (July 1983).
Ion implantation and Rutherford backscattering depth profile analysis have been used to study changes in the near-surface composition of nuclear waste glasses that were corroded in aqueous media. The dissolution rate of the glass network during early stages of corrosion and effects of solution chemistry on the glass surface-layer composition were investigated. Properties of the altered layer were found to vary significantly as a function of the *pH* of the corroding solution. (10 refs.)

105960 Oxidation-reduction properties of mixed oxides in lanthanum-uranium-oxygen system. H.Tagawa (Inst. of Environmental Sci. & Technol., Yokohama Nat. Univ., Yokohama, Japan), T.Fujino, K.Ouchi, K.Watanabe, K.Saita, T.Morimoto.
J. Nucl. Sci. & Technol. (Japan), vol.20, no.6, p.467-74 (June 1983).
The oxidation-reduction properties and the phase relations of mixed oxides in the system La-U-O were examined by means of thermogravimetry and X-ray diffraction method. The O/M ratios of the mixed oxides $La_yU_{1-y}O_{2\pm x}$, prepared at 1650°C in vacuo by the reaction of La_2O_3 and UO_2, were expressed as 2-0.5 y except $0.2 \leq y \leq 0.4$. The oxides were the single fluorite phase at $y \leq 0.7$. These oxides of $0.2 \leq y \leq 0.6$ were oxidation-susceptible in air even at room temperature. For the oxides heated or prepared in air at 1000°C, the O/M ratio vs. y relationship was composed of three line with the turning points, 2.26 at $y=0.27$ and 1.92 at $y=0.70$. The fluorite phase was observed in the regions of $0.3<y<0.45$ and $0.7 \leq y<0.9$, and the rhombohedral phase was in $\sim 0.55<y<\sim 0.7$. The O/M ratios of the oxides reduced with hydrogen were nearly 2 at $y \leq 0.2$ and decreased with increasing y at $y>0.2$. The oxide of $y=0.5$ had a minimum in the O/M ratio when the oxide reduced with hydrogen was oxidized in air. (19 refs.)

105961 Numerical model of radionuclide migration in geologic media. H.Kimura, S.Muraoka (Div. of Environmental Safety Res., Tokai Res. Establ., JAERI, Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.6, p.503-10 (June 1983).
A three-dimensional radionuclide migration model has been developed by using the direct-simulation method. The phenomena taken into account are radioactive decay, convection and dispersion in the ground water and sorption and desorption in the geologic media. The decay chain is represented by the particle's character change using decay probability. A smoothing method is proposed to make an even distribution of particles and to obtain the exact radioactive inventory. Numerical calculations of the ^{245}Cm and ^{234}U decay chain in the single layered geologic media have been carried out, and reasonable results have been obtained in comparison with the INTRACON study. Nuclide migration of the ^{237}Np decay chain in three-layered geologic media were examined and shown graphically. (8 refs.)

105962 Migration of cesium-137 through sandy soil layer; effect of fine silt on migration. T.Ohnuki, Y.Wadachi (Atomic Energy Society of Japan, Tokyo, Japan).
J. At. Energy Soc. Jpn. (Japan), vol.25, no.6, p.486-93 (June 1983). In Japanese.
The migration of ^{137}Cs through sandy soil layer was studied by considering the migration of fine silt by the column method. It was found that a portion of fine silt migrated through the soil layer accompanying with ^{137}Cs. The mathematical migration model of ^{137}Cs involving the migration of fine silt through such a soil layer is presented. This model is in good accordance with the calculated concentration distribution curve in a sandy soil layer and the effluent curve. (12 refs.)

105963 Successful on-load refuelling at Hinkley Point AGR. R.W.Hall, C.A.Chaffey.
Nucl. Eng. Int. (GB), vol.28, no.343, p.23-6 (July 1983).
Since September 1982 on-load refuelling, at reduced power, has been routinely carried out at Britain's Hinkley Point B and Hunterston B AGRs. This is the result of an extensive development programme aimed at overcoming earlier apparent difficulties, which led to the cessation of on-load fuel handling in 1978, pending reassessment of safety arguments. Progress to date and future prospects are described. (no refs.)

105964 Looking at waste management worldwide. M.H.Raudenbush (S.M. Stoller Corp., Boulder, CO, USA).
Nucl. Eng. Int. (GB), vol.28, no.345, p.30-3 (Aug. 1983).
The recent IAEA waste management conference in Seattle showed that, though there is a considerable degree of international agreement on engineering issues, there remain wide policy differences between countries. These differences are most pronounced in national timetables for the final disposal of high-level waste and the assessment of long-term risk. These issues are discussed. (no refs.)

105965 Disposing of intermediate and low level waste in Britain. A.Cruickshank.
Nucl. Eng. Int. (GB), vol.28, no.345, p.33-7 (Aug. 1983).
A new organisation, Nirex, has been set up by Britain's nuclear industry to manage the disposal of its low and intermediate level waste. This co-operative venture, has a sizeable task before it. (no refs.)

105966 Contribution of photoelasticity measurements to the evaluation of operating safety of nuclear facilities (photoelasticimetric determination of stress intensity coefficient). J.Visner, S.Stepanek.
Skoda Rev. (Czechoslovakia), no.1, p.32-6 (1983).
Describes how the photoelectricity laboratory of Skoda contributes to the maintenance of operating safety standards for nuclear power stations. (no refs.)

105967 Evaluation of liquid radwaste processing at Turkey Point power station. D.J.Feingold, J.M.Donis, A.Byrnes (Florida Power & Light Co., Juno Beach, FL, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.20-3 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
This paper establishes baseline data on the disposable demineralizer system used at Turkey Point to process dirty liquid radwaste. This system is utilized at the Turkey Point Nuclear Station which consists of two 760-MW(e) Westinghouse units. The cost to process the liquid waste, including operation, maintenance, materials, waste transport and burial, and contract services, averages \$57/m^3 (21 cent/gal). The dose incurred from operation and maintenance of the system averages 1.3 E-3 man-rem/m^3 (4.6 E-6 man-rem/gal) of liquid processed. The carbon filter utilized in the disposable system does not add significantly to the process decontamination factor (DF). On the average, 103 m^3 of liquid is processed per cubic meter of liquid process system waste buried. (no refs.)

105968 Etched disk filter insert for the Millstone Unit 1 radwaste system. R.C.Keith (TTI Engng., Norwood, MA, USA), D.F.Snedeker.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.23-4 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
An etched disk filter insert system was installed in the Millstone Unit 1 radwaste floor drain filter vessel in August 1982. The filter insert system is an approach that has been developed to retrofit existing precoat filters to etched disk filters without changing the filter vessel and the associated piping and valves. The insert, which provides the mounting plate for the etched disk elements and contains the air accumulator for backflushing, directly replaces the flanged head and elements of the existing precoat filter vessel. The filter outlet flange is located such that it bolts directly to the existing outlet piping. The filter inlet and backflush outlet connections remain unchanged on the existing filter vessel. (no refs.)

105969 Performance testing of Marble Hill radwaste solidification system. J.B.Mason (UNC Nuclear Industries Inc., Richland, WA, USA), P.L.Hiland.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.24-5 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
This paper describes the predelivery inspections and performance tests that were performed on the radwaste solidification system for the Marble Hill Nuclear Power Station Units 1 and 2. Public Service of Indiana (PSI), owner of the Marble Hill Station, contracted with UNC Nuclear Industries Inc. (UNC) for the design, fabrication and testing of a complete Portland cement-sodium silicate radwaste processing, solidification, and handling system (RPSS) for the Marble Hill Station. (no refs.)

105970 Recent developments and operating experiences with cement immobilization of low-level radioactive waste. J.P.Staehr (Chem-Nuclear Systems Inc., Columbia, SC, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.25-6 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Cement has long been a favorite medium for the solidification of aqueous low-level radioactive waste. However, with the pending implementation of 10CFR61 and rising costs associated with radwaste disposal, questions continue to be raised about its suitability. Chem-Nuclear Systems Inc. is engaged in a research and development program aimed squarely at economical control of product quality while continuing to conform to regulatory requirements. The results of this program thus far have clearly shown that cement remains a very viable waste binder. (3 refs.)

105971 A computerized program for waste inventory tracking and shipping optimization. R.H.Klinetob, C.Calia (EDS Nuclear, San Francisco, CA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.26-30 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Over the past several years radioactive waste generation and disposal have undergone significant change. All but two low-level waste (LLW) burial sites have been closed permanently. New US Nuclear Regulatory Commission (NRC) regulations, 10CFR61, effective at the end of 1983, require increased isotope analysis and tracking. These changes make the job of handling wastes more difficult and time consuming. The time currently required for some utilities to do the calculations and paperwork needed to ship a truckload of dry active waste can amount to several days. Several hours are required for processing the papers for shipping a single 100 to 200 ft^3 container of process waste. A radioactive waste tracking and shipping optimization program called WASTETRAK has been developed for Pennsylvania Power and Light to address these problems. It is currently up and running at the Susquehanna Units. The program provides a means of assembling and manipulating the large amount of data required for radioactive waste tracking and shipping. (no refs.)

105972 Determination of the maximum justifiable capital expenditure for volume reduction systems. M.H.Jacobs, C.C.Miller, L.G.Young (Sargent & Lundy Engrs., Chicago, IL, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.28-30 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The costs associated with the disposal of low-level radioactive waste have increased dramatically over the last ten years. The cost of transportation has increased an average of 7%/yr over the last eight years and the burial costs have increased over 40% annually in the same time period. With these rapidly increasing costs, many utilities are considering the installation of new volume reduction (VR) equipment in an attempt to reduce the volume of radioactive waste that must be disposed of each year, thereby reducing the disposal cost. As with any equipment purchase for retrofit, the key issues are the performance and the operational cost savings of the system. In volume reduction systems, the cost savings arise from packaging, transportation, and burial cost reductions. The purpose of this paper is to demonstrate that the equivalent capital investment (ECI) method of economic evaluations is a convenient method for determining the justifiable capital investment for a VR system backfit. (no refs.)

105973 Evaluation of boron-10 depletion during pressurized water reactor operation. N.Asai (Kansai Electric Power Co. Ltd., Osaka, Japan), N.Yamazaki, H.Tochihara, A.Takahashi, T.Ohno.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.70-1 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Boric acid is used as a chemical shim in a pressurized water reactor (PWR) to adjust the long-term reactivity change. Critical boron concentration in the hot full power, all control rods out, equilibrium xenon condition varies from about 1000 ppm at beginning of cycle (BOC) to about 10 ppm at end of cycle (EOC), in which boron means natural boron. Natural boron contains 19.8 at.% ^{10}B which is a strong neutron absorber. The percentage of ^{10}B in the boron concentration reduces during operation because of ^{10}B depletion in the core. The calculational model which simulates ^{10}B depletion in a PWR, assuming realistic boration and dilution operation, shows that ^{10}B depletion during normal operation is not negligible and should be considered in the resultant boron concentration. (no refs.)

105974 Rationale for the choice of radwaste volume reduction by hyperfiltration at a Tennessee Valley Authority nuclear plant. T.Hillmer, D.Shoemaker (Tennessee Valley Authority, Chattanooga, TN, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.92-3 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The installed liquid radwaste processing system at Sequoyah Nuclear Plant (SQN) consists of a 7.5/15 gal/min rated auxiliary waste evaporator and a 2 gal/min rated waste evaporator. Large volumes of liquid waste (up to 25.8 gal/min average over a month) are being generated at SQN. Since the evaporators cannot process the volume of liquid waste being generated, a new system is needed. Based on the testing, it appeared that a reverse osmosis (RO) unit used in conjunction with demineralization for polishing was potentially the most viable system to install at SQN. To verify this, a twofold approach was developed: (a) to perform comprehensive testing of an RO unit with a dynamically formed membrane on actual plant waste streams, and (b) to perform a cost-benefit analysis for a variety of radwaste systems to determine the most economically attractive alternative. (no refs.)

105975 Salem Unit I nuclear plant radwaste liquid volume reduction system operation and performance. J.W.Walcott (HPD Inc., Naperville, IL, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.93-5 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The Salem Unit I nuclear plant began full use of the HPD evaporator/crystallizer liquid volume reduction system during 1982. During initial operation, ~400000 gal of feed was processed with a resultant concentrated waste volume of 1500 gal. During continuous operation, a concentration factor of 267 to 1 was realized. Information concerning chemical waste components particularly pH and chloride levels, and chemical pretreatment is presented to allow determination of system limitation. The interface with the cement solidification system for solidifying the liquid waste is also discussed. Operation of the system is analyzed with particular comments concerning operation time between mandatory shutdown and maintenance requirements. An economical evaluation of capital costs and operating costs is presented for the evaporator/crystallizer system. (no refs.)

105976 Impact of polyvinyl chloride content on incineration of dry active wastes: problems and solutions. E.M.Vander Wall, R.E.Jones (Aerojet Energy Conversion Co., Sacramento, CA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.96-7 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Low-level radioactive wastes generated at commercial nuclear power stations consist of evaporator concentrates, spent ion-exchange resins and sludges, and dry active wastes (DAW). At most plants, the DAW represents a significant portion of the total wastes that must be processed, packaged, and shipped to a commercial burial site for final disposal. The DAW consists of paper, cardboard, wood, cloth, plastic sheet, rubber, and other similar materials which contain very little radioactivity. In most plants, the DAW is compacted in a 55-gal drum and shipped for disposal. Compaction provides a volume reduction (VR) factor of about 3. An alternative option to compaction of the DAW is to incinerate the material, which provides a much greater VR factor, on the order of 100. The paper examines the impact of the PVC content on the incineration of the DAW and the achievable VR factor. (no refs.)

105977 Incineration of spent ion-exchange resins at commercial nuclear stations. R.Garcia, E.M.Vander Wall (Aerojet Energy Conversion Co., Sacramento, CA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.97-8 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
During the past ten years the Aerojet Energy Conversion Company (AECC) has developed and demonstrated a fluidized-bed volume reduction (VR) system for processing low-level radioactive wastes generated at commercial nuclear power stations. The AECC VR System utilizes two fluidized-bed vessels, a dryer, and an incinerator, to process liquid evaporator concentrates, dry active wastes, contaminated oil, and spent ion-exchange resins. A common off-gas cleanup system services both fluidized-bed vessels and removes particulate, iodine, hydrogen chloride, and sulfur dioxide from the gas stream prior to discharge. During the past three years the development and demonstration effort was associated with the incineration of spent ion-exchange resins. A description of this program, results obtained, benefits associated with spent resins incineration, and licensing of the system are discussed. (no refs.)

105978 The impact of polyvinyl chloride on waste incineration systems. B.Waters (Combustion Engng. Inc., Windsor, CT, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.98-9 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The paper addresses the impact of processing polyvinyl chloride (PVC) on material selection and volume reduction (VR) factors in an incineration system. Consideration is given to PVC sources, pretreatment, combustion processes, material selection, and VR factors. The impact on volume reduction is addressed for two cases: (a) the effect on the incineration process, and (b) the effect on the overall VR process including solidification of the incinerator product. A summary conclusion addresses the practical limitations for incinerating PVCs. (no refs.)

105979 Certification of a uranium metal reference material for chemical analyses.
Report EUR 8349 EN, Comm. European Communities, Luxembourg (1983), 27 pp.
The procedure followed for the certification of the EC uranium metal reference material no. 101 is described. The certificate appended to the report gives the uranium mass fraction, the overall uncertainty attached to that value and recommendations for use of the material. (1 ref.)

105980 BENCHMARK. Reference data on post irradiation analysis of light water reactor fuel samples. S.Guardini, G.Guzzi.
Report EUR 7879 EN, Comm. European Communities, Luxembourg (1983), 162 pp.
The aim is to review the results obtained within the framework of the Benchmark activity, to indicate the field of application for these results, and to provide information that will make them simple and straightforward to use. The Benchmark activity was a destructive assay carried out in cooperation

with various European nuclear power plant utilities on irradiated LWR fuel elements. The irradiated assemblies were dismantled, some fuel pins were selected and pellets, representative of both unperturbed and perturbed reactor core regions were cut from them after γ-scanning. The pellets were then dissolved and submitted to α, γ and mass spectrometry in order to determine fission-product and heavy-element buildup, isotopic ratios and burnup. The aim of this activity was to prepare a set of clean reference data from which many users would profit. (62 refs.)

105981 Testing and evaluation of solidified high-level waste forms. R.De Batist.
Report EUR 8424 EN, Comm. European Communities, Luxembourg (1983), 123 pp. Contract 121-80-53 WASUK/122-80-53 WASD/123-80-55 WASF/124-80-55 WASB/125-80-55 WASN/232-81-53 WASD/268-81-55 WASF.
Describes the work carried out during the period 1980-81 on the characterisation and evaluation of several solidified high level waste forms suggested as examples by member countries of the European Community. In addition to borosilicate glasses and a glass ceramic investigated during the preceding programme of the European Atomic Energy Community and which are being further studied, two new borosilicate glass compositions have been introduced. The chemical stability of these waste forms, in particular with respect to geological disposal conditions, is examined as well as effects of alpha-radiation and of devitrification. Leaching studies are also discussed. (23 refs.)

105982 Diffusive transport of strontium-85 in sand-bentonite mixtures. R.W.Gillham, M.J.L.Robin, D.J.Dytynyshyn.
Report AECL-6838, Atomic Energy Canada Ltd., Chalk River, Ont. (June 1983), 34 pp.
Diffusion experiments have been used to determine the transport of ^{85}Sr in sand-bentonite mixtures. The diffusion experiments were performed on one natural soil (Chalk River sand) and on seven mixtures of bentonite and silica sand, containing from 0% to 100% bentonite. Two nonreactive solutes (^{36}Cl and ^{3}H) and one reactive solute (^{85}Sr) were used in the study. The experiments with nonreactive solutes yielded estimates of tortuosity factors. Retardation factors were obtained from experimental porosities, experimental bulk densities, and from batch distribution coefficients (K_d). These K_d values are a simple way of describing the solute/medium reaction, and are based on the assumption that the cation-exchange reaction may be described by a linear adsorption isotherm passing through the origin. The results demonstrate that, for practical purposes and for these experimental conditions, the use of the distribution coefficient provides a convenient means of calculating the effective diffusion coefficient for ^{85}Sr. The porosity and bulk density were also found to have a considerable influence on the effective diffusion coefficient, through the retardation factor. (11 refs.)

105983 Radwaste incineration, is it ready for use?. B.W.Coplan (BVC Consultants Inc., Sun City Center, FL, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.121-32
The original incineration installations experienced operating problems and demonstrated various design deficiencies. However, substantial operating time has been accumulated particularly in Canada, Japan and Europe. As a result of the information gained by the operating installations it is believed that the second generation, state-of-the-art, radwaste incineration systems now commercially available are sufficiently advanced to be operationally reliable and merit installation. (no refs.)

105984 Design and performance of a fluidized bed incinerator for TRU combustible wastes. L.J.Meile, F.G.Meyer (Rockwell Internat., Golden, CO, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.133-8
Problems encountered in the incineration of glovebox generated waste at Rocky Flats Plant (RFP) led to the development of a fluidized bed incineration system for transuranic (TRU) combustible wastes. Laboratory and pilot-scale testing of the process preceded the installation of an 82 kg/hr production demonstration incinerator at RFP. The FBI process is discussed, and the design of the demonstration incinerator is described. Operating experience and process performance for both the pilot and demonstration units are presented. (4 refs.)

105985 Acid digestion of combustible radioactive wastes. C.R.Allen, R.E.Lerch, M.D.Crippen, R.G.Cowan (Westinghouse Hanford Co., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.139-47
Engineering demonstration of the acid digestion process has been performed at Westinghouse Hanford Company in the Radioactive Acid Digestion Test Unit (RADTU). RADTU construction was completed in June 1977. Following shakedown testing, RADTU began processing potentially contaminated non-glovebox wastes from a plutonium facility (234-5 Building) in November 1978. RADTU was modified for capacity increase which included a change in digester design from a slab tray geometry to an agitated annular digester in December 1979. Major quantities of plutonium were introduced into the system in December 1980 when over 500 kg of waste containing multigram quantities of plutonium were processed during a two week run. Data were collected on plutonium behavior in the system and overall process decontamination factors were calculated. A series of special tests were conducted to assess the system's ability to process unique waste forms including ion exchange resin, decon rags, wooden structural materials, reactive scrap and a plastic shipping bottle. Because funding for waste management operations is currently limited, RADTU has been placed in ready standby status. (1 ref.)

105986 Experimentation with a prototype incinerator for beta-gamma waste. M.G.Farber, K.E.Lewandowski, G.W.Becker (Savannah River Lab., E.I. du Pont de Nemours & Co., Aiken, SC, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.148-52
A test facility for the incinerator of suspect and low-level beta-gamma waste has been built and operated at the Savannah River Laboratory. The processing steps include waste feeding, incineration, ash residue packaging, and off-gas cleanup. Demonstration of the full-scale (180 kg/hr) facility with nonradioactive, simulated waste is currently in progress. At the present time, over nine metric tons of material including rubber, polyethylene, and cellulose have been incinerated during three burning campaigns. A comprehensive test program of solid and liquid waste incineration is being implemented. The data from the research program is providing the technical basis for a phase of testing with low-level beta-gamma waste generated at the Savannah River Plant. (no refs.)

105987 Volume reduction of radioactive resins through controlled incineration. E.J.Brown, J.M.Wu (Dept. of Nuclear Engng., Rensselaer Polytech. Inst., Troy, NY, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.153-6
Volume reduction experiments were carried out in a laboratory scale prototype furnace under controlled incineration conditions. Nuclear grade cation-exchange resins from three manufacturers carrying simulated radioactive contamination were used in all experiments. Volume reductions were found to be approximately the same for each of the different resins. Reduction was found to be heavily dependent on the temperature of primary incineration and the presence or lack of oxygen. Volume reduction potentials of about 95% or better are achievable during oxidation incineration and 85% in pyrolysis carried out at 750°C. Entrainment levels of radioactive cesium in the offgas were measured for pyrolysis and oxidation incinerations carried out at 750°C and were found to be 0.54% and 1.7% respectively of the total cesium activity in the spent resin. (3 refs.)

105988 Development and testing of prototype alpha waste incinerator off-gas systems. E.J.Freed, G.W.Becker (Savannah River Lab., E.I. du Pont de Nemours & Co., Aiken, SC, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.157-60
A test program is in progress at Savannah River Laboratory (SRL) to confirm and develop incinerator design technology for an SRP production Alpha Waste Incinerator (AWI) to be built in the mid-1980s. The Incinerator Components Test Facility is a full scale (5 kg/hr), electrically heated, controlled-air prototype incinerator built to burn nonradioactive solid waste. The incinerator has been operating successfully at SRL since March 1979 and has met or exceeded all design criteria. During the first 1-1/2 years of operation, liquid scrubbers were used to remove particulates and hydrochloric acid from the incinerator exhaust gases. A dry off-gas system is currently being tested to provide data to Savannah River Plant's proposed AWI. (no refs.)

105989 Controlled air pyrolysis incinerator. K.H.Dufrane (Atcor Engineered Systems Inc., Farmington, CT, USA), M.Wilke.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.161-7
An advanced controlled air pyrolysis incinerator has been researched, developed and placed into commercial operation for both radioactive and other combustible waste. Engineering efforts concentrated on providing an incinerator which emitted a clean, easily treatable off-gas and which produced a minimum amount of secondary waste. Feed material is continuously fed by gravity into the system's pyrolysis chamber without sorting, shredding, or other such pretreatment. Metal objects, liquids such as oil and gasoline, or solid products such as resins, blocks of plastic, tire, animal carcasses, or compacted trash may be included along with normal processed waste. The temperature of the waste is very gradually increased in a reduced oxygen atmosphere. Volatile pyrolysis gases are produced, tar-like substances are 'cracked' and the resulting product, a relatively uniform, easily burnable material, is introduced into the combustion chamber. (no refs.)

105990 Waste vitrification: a historical perspective. J.L.McElroy, W.J.Bjorklund, W.F.Bonner (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.171-7
The possibility of converting high-level wastes (HLW) to glass was first pursued in Canada and England at a time when other countries were evaluating many other alternatives. By 1966, the British had completed radioactive demonstrations of the FINGAL pot process, converting HLW to borosilicate glass. By this time other countries, including France and the United States, had begun using the glass waste form. Beginning in 1966, several processes, including phosphate and borosilicate glass, were demonstrated by the US in the Waste Solidification Engineering Prototypes (WSEP) program at the Pacific Northwest Laboratory (PNL). Most of the current vitrification processes are adaptations of the FINGAL pot process or the continuous metallic melter used in the WSEP program. One notable exception is the joule-heated ceramic melter which was adapted from commercial glass technology for HLW by PNL in the mid-1970s. Both batch and continuous processes have been developed to an advanced stage of readiness. These processes are described and compared. (24 refs.)

105991 Waste glasses—requirements and characteristics. J.E.Mendel (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.178-83
The regulatory requirements relating to waste glass that have been presented recently in draft form by the US Environmental Protection Agency (EPA) and Nuclear Regulatory Commission (NRC) are reviewed. These requirements assume that waste glass will be considered as a subcomponent of a waste package. Current waste package concepts are described and the important characteristics of waste glass are summarized, with emphasis on the present status of standardizing methods for measuring the characteristics of waste glass. (15 refs.)

105992 High-level waste vitrification technique in a full-scale pilot plant. S.Weisenburger (Inst. fur Nukleare Entsorgungstech., Karlsruhe Nuclear Res. Centre, Karlsruhe, Germany).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.184-90
The liquid-fed ceramic melter process is reviewed and evaluated. Process application in a full-scale cold pilot plant, currently under construction in the Institut fur Nukleare Entsorgungstechnik, is described. It is concluded that the process has high potential for use in future industrial vitrification plants. (1 ref.)

105993 Savannah River Laboratory's operating experience with glass melters. F.H.Brown, C.T.Randall, M.B.Cosper, J.P.Moseley (Savannah River Lab., E.I. du Pont de Nemours & Co., Aiken, SC, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.191-6
The Department of Energy, with recommendations from the Du Pont Company, is proposing that a Defense Waste Processing Facility be constructed at the Savannah River Plant to immobilize radioactive waste. The immobilization process is designed around the solidification of waste sludge in borosilicate glass. The Savannah River Laboratory, who is responsible for the solidification process development program, has completed an experimental program with one large-scale glass melter and just started up another melter.

Experimental data indicate that process requirements can easily be met with the current design. (2 refs.)

105994 Operating characteristics of a direct liquid-fed vitrification process. W.J.Bjorklund, R.A.Brouns (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.197-202
For several years, The Pacific Northwest Laboratory has studied the process of immobilizing stimulated high-level radioactive waste by directly feeding it to an electric melter as a slurry containing glass-forming chemicals. Over 65000 L of simulated waste have been processed in more than 1000 h of operation in various-sized melters. A feed system using an air-operated positive-displacement diaphragm pump has been shown to be reliable. Melting rates ranging from 40 to 60 $kg/h\text{-}m^2$ (kilograms of total oxides per hour per square meter of melter surface area) have been demonstrated. Large-scale tests have shown the process to be stable, safe and capable of capacities meeting the needs of both commercial and defense waste immobilization programs now under study in the United States. (4 refs.)

105995 Corrosion experience with a slurry-fed ceramic melter. S.M.Barnes, G.J.Sevigny, R.W.Goles (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.203-7
Presents the findings of an investigation into the long-term performance of construction materials for joule-heated, ceramic-lined melters. The materials investigated include: the glass contact refractories, the melter electrodes and the process off-gas containment materials. The corrosion rates and mechanisms for these materials are presented. The report also includes the initial corrosion data from testing of improved effluent containment materials. Results indicate that melter service lives in excess of three years are attainable. (5 refs.)

105996 Utilization of a drum drier for the conditioning of radioactive wastes. St.Halaszovich, S.Dix, E.Merz (Inst. for Chem. Technol., Kernforschungsanlage Julich GmbH, Julich, Germany).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.208-11
Arguments are presented for the preference of a separate drying step in the solidification process of liquid wastes. In particular, the possibilities and advantages of the utilization of a drum drier for the conditioning of high- and medium-level wastes are described, referring to the experience gained in its conventional utilization underlined by practical use and experiments. Main aspects discussed are handling and safety, variety of possible products, throughput and economy. Finally, the future work is outlined. (5 refs.)

105997 Microstructures and crystallization in simulated waste glasses. A.Skokan, V.Schaurer (Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.212-17
A borosilicate glass has been developed as a solidification matrix for high level radioactive waste solution at the Karlsruhe Nuclear Research Centre. As a part of product characterization, the microstructures and the crystallization behavior of the glass products were investigated in the range from 350 to 750°C with annealing times up to 10000 hours. In addition to ruthenium oxide and palladium alloys that are insoluble in the melt, two major silicate phases were observed after thermal treatment. The maximum degree of crystallinity measured by X-ray diffraction analysis was between 20 and 30% at 650°C. Heat treatment below the transition temperature of the glass led to no appreciable crystallization. (6 refs.)

105998 The IAEA's role in radioactive waste management, particularly for low- and intermediate-level wastes. E.R.Irish (Div. of Nuclear Fuel Cycle, IAEA, Vienna, Austria).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.221-7
The management of low- and intermediate-level wastes is an area of increasing interest to practically all Member States having activities in the nuclear field, in particular to those which are producing electricity and heat by use of nuclear energy. This fact is reflected in the Agency's activities and in this presentation. (no refs.)

105999 Low- and intermediate-level waste management practices in Belgium. J.C.Claes, N.Van de Voorde, P.Dejonghe (Study Centre for Nuclear Energy-CEN/SCK, Mol, Belgium).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.228-36
The main ongoing nuclear activities and the organization of LLW and ILW management in Belgium are described. Data are presented on the waste arisings and characteristics. The treatment and conditioning techniques, currently applied at the waste processing plants, are reported. Attention is also drawn to the new processes and managerial improvements, which are being implemented and will become operational in 1982-1983. The importance of sea dumping as a LLW disposal strategy for Belgium, among other West-European countries, is underlined. Information is given on the packaging procedures and sea dumping operations. (7 refs.)

106000 Low level and intermediate level wastes management practice in France. A.Faussat.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.237-42
The long-term industrial management of radioactive waste which is or will be produced mainly by the electronuclear industry is handled in France by a national agence, l'Agency Nationale pour las Gestion des Dechets Radioactifs (ANDRA), which was formed in 1979 within the CEA by an interministerial order. (no refs.)

106001 LLW and ILW waste management practices in Italy. A.Donato (CNEN CSN-Casaccia, Roma, Italy).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.243-7
LLW and ILW radwastes are produced in Italy by power plants pilot reprocessing plants and nuclear research centers. Liquid radwastes produced at old power plants are treated by ion exchange, chemical precipitation or evaporation, while in the new Caorso BWR plant, Powdex resins and filtration are used, followed by urea-formaldehyde solidification. No solidification processes are used at the two pilot reprocessing plants (Eurex and Itrec), while cementation and bituminization are employed at the research centers (Casaccia, Camen and Ispra). Solid wastes are generally compacted where possible and stored. The management of radwastes in Italy is highly influenced by the uncertainties concerning the type of disposal to be adopted. (11 refs.)

106002 Low- and intermediate-level waste management practices in Canada. D.H.Charlesworth (AECL Res. Co., Chalk River, Ontario, Canada).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.248-51
Low- and intermediate-level wastes arise in Canada from the operation of nuclear power stations, nuclear research establishments, nuclear fuel and radioisotope production facilities, as well as from many medical, research and industrial organizations. Essentially all of the solid radioactive wastes are stored in a retrievable fashion at five waste management areas from which a portion is expected to be transferred to future disposal facilities. Waste processing for volume reduction and stabilization is becoming an increasingly important part of low-level waste management because of the advantages it provides for both interim storage currently, and permanent disposal in the future. (19 refs.)

106003 Low- and intermediate-level waste management practices in Japan. M.Tsuchiya (Radioactive Waste Management Center, Tokyo, Japan).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.252-5
At present, disposal of low-level radioactive wastes is yet to be carried out in Japan. Liquid wastes, except for the diluted discharge of very low-level waste into the environment, are mostly solidified with cement or bitumen to be packed in 200 litre drums and put in storage. Solid wastes, on the other hand, are mostly put into 200 litre drums, some of them being incinerated beforehand. Efforts are being made to develop technology for reducing the production of wastes. Regarding sea disposal a test dumping program has been forestalled by the opposition of South Pacific islanders, but the Japanese are endeavoring to promote their understandings on this matter. Regarding land disposal, first they are going to start centralized storage, then to shift to underground disposal. (no refs.)

106004 Low and intermediate level waste management practices in the United Kingdom. F.H.Passant (CEGB, Gloucester, England).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.256-60
Current UK policy and practices for the management of low and intermediate activity wastes are summarised. Methods of treatment, packaging and transport and described for those wastes which are disposed of by shallow trench burial and by sea dumping. These disposal practices are described as are the methods of storage for those wastes awaiting disposal. Current and possible future developments are briefly outlined which included improved methods of handling and the establishment of disposal routes for all intermediate activity wastes. (5 refs.)

106005 US Department of Energy program for commercial low-level waste management—a progress report. J.M.Brown (EG&G Idaho Inc., Idaho Falls, ID, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.261-2
The Low-Level Waste Management Program was established in September 1978 by the US Department of Energy. EG&G Idaho Inc. in Idaho Falls, Idaho is the lead contractor for the National Program and has been coordinating program activities since 1979. The goal of the program is to ensure that low-level wastes are disposed of in a manner that will protect public health and safety over the long term. To accomplish this goal, the primary objective of the program is to provide an acceptable low-level waste management system by 1986. (no refs.)

106006 Incinerator development program for processing transuranic waste at the Idaho National Engineering Laboratory. T.G.Hedahl (EG&G Idaho Inc., Idaho Falls, ID, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.265-9
In the fall of 1981, two short-term tests were conducted on a controlled air and a rotary kiln incinerator to assess their potential for processing transuranic (TRU) contaminated waste at the Idaho National Engineering Laboratory (INEL). The primary purpose of the test program was a 'proof-of-principle' verification that the incinerators could achieve near-complete combustion of the combustible portion of the waste while mixed with high percentages of noncombustible and metal waste materials. Other important test objectives were to obtain system design information including off-gas and end-product characteristics and incinerator operating parameters. Approximately 7200 kg of simulated (non-TRU) waste from the INEL were processed during the two tests. (no refs.)

106007 Coreless induction melting of simulated transuranic wastes. J.L.McCall, R.D.Tenaglia (Battelle Columbus Labs., Columbus, OH, USA), G.W.Gibson, R.L.Benedetti.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.270-5
The major objective of the Transuranic Waste Treatment Facility (TWTF) is to develop a facility to process low-level transuranic waste stored at the Idaho National Engineering Laboratory (INEL). One concept for processing the waste involves a first stage incineration process to reduce the level of combustibles and a second stage melting process to further consolidate the end product. Coreless induction melting was selected for evaluation as a melting process. Uncontaminated waste representative of the types of INEL wastes was charged directly onto the surface of a cast iron bath to form slag and metal products. Metal, slag, off-gas and particulate products were collected and characterized. Coreless induction melting was found to be a feasible method to process INEL waste provided that problems of low slag fluidity and short refractory life can be overcome. (4 refs.)

106008 Investigations of the treatment of alpha-contaminated wastes at the Karlsruhe Nuclear Research Center. H.Krause (Kernforschungszentrum Karlsruhe GmbH, Inst. fur Nukleare Entsorgungstechnik, Karlsruhe, Germany).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.276-80
R&D-activities are being carried out with the aim of separating actinides and F.P. from MLLW to such an extent that it virtually becomes a non-TRU

waste and requires only a small shielding. Several types of TRU-waste concentrates have been encapsulated in a ceramic matrix successfully. This matrix is characterized by a low sensitivity to the chemical composition of the waste, a high leach resistance and radiation stability. Cladding hulls could be embedded in lead by pressing a mixture with lead chips at room temperature. The acid digestion process could be improved and developed to such an extent that active demonstration in a pilot plant can start in the near future. (9 refs.)

106009 Future trends in transuranic waste generation. R.T.Jensen (Rockwell Internat., Energy Systems Group, Rocky Flats Plant, Golden, CO, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.281-5
This paper presents data from the major Department of Energy (DOE) sites that will generate 92% of all Transuranic (TRU) waste during the next five years. Forecasts are given for three kinds of activities. They include production, decontamination and decommissioning (D&D), and research and development. The major production activities and locations are described, and forecasts are given for each one. This report further describes the type and amount of waste forms that will be generated. The expected trends for the categories are presented, and possible areas for reducing waste generation are given. (9 refs.)

106010 Advances in measurement of alpha-contaminated wastes. D.A.Close, T.W.Crane, J.T.Caldwell, W.E.Kunz, E.R.Shunk, J.C.Pratt (Los Alamos Nat. Lab., Los Alamos, NM, USA), L.A.Franks, S.M.Kocimski.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.286-90
A comprehensive program is in progress at the Los Alamos National Laboratory for the development of sensitive, practical, nondestructive assay techniques for the quantification of low-level transuranics in bulk solid wastes. The program encompasses a broad range of techniques, including sophisticated active and passive gamma-ray spectroscopy, passive neutron detection systems, pulsed portable neutron generator interrogation systems, and electron accelerator-based techniques. The techniques can be used with either low-level or high-level beta-gamma wastes in either low-density or high-density matrices. (14 refs.)

106011 Current status of the multi-isotopic transuranic waste assay system. W.E.Kunz, J.T.Caldwell, J.D.Atencio, W.Bernard, S.W.France, G.C.Herrera, H.H.Hsu, T.H.Kuckertz, J.C.Pratt (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.291-5
The authors have designed, constructed, tested, and are scheduled to field a 208-l barrel-sized working version of our multi-isotopic transuranic assay system. This system uses both passive neutron multiplicity and pulsed active measurements to identify and quantify spontaneous neutron emitters and fissile TRUE isotopes. Using the system they can separately quantify up to seven individual transuranic isotopes under favorable conditions with the intrinsic sensitivity to screen or assay barrels at or below the 10 nCi/g transuranic level. The measured 3σ sensitivity for ^{239}Pu is about 0.5 mg. A large range of waste matrix materials can be accommodated by the system, as well as extremes in both gamma-ray and neutron backgrounds. (6 refs.)

106012 Experimental evaluation of the differential die-away pulsed-neutron technique for the fissile assay of hot irradiated fuel waste. J.T.Caldwell, W.E.Kunz, H.F.Atwater, J.D.Atencio, G.C.Herrera, R.E.Morgado, J.C.Pratt (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.296-9
Hot irradiated fuel waste packages containing self neutron sources up to 10^7 n/s may be assayed successfully with a 25-mg ^{239}/Pu detection sensitivity using a differential die-away fissile assay system based on a Sandia-designed 14-MeV neutron generator. With a minor design change, our system can accommodate contact gamma dose rates up to 10^4 R/h with no loss of fissile assay sensitivity. (7 refs.)

106013 Alpha content and long-term safety in nuclear waste management. B.A.Hunt, H.Dworschak, F.Mousty (Commission of the European Communities, Joint Res. Centre-Ispra Establ., Ispra, Italy).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.300-4
Radioactive waste management practices and concepts have been examined. The concentration/confinement concept always applicable to the HAW fraction has gradually and progressively been applied to the ever increasing MAW arisings containing significant long-lived components. Due to the long-term hazard posed by such components, mainly the transuranic actinides, particular efforts have been directed over the past few years to improvements in alpha waste reduction, conditioning and disposal. An alternative strategy however is proposed, backed by experimental results, which offers the possibility to combine all the alpha sources into a unique chemically homogeneous stream, thus allowing more stable matrices to be selected for their immobilization. (8 refs.)

106014 Department of Energy's selection of high level waste forms. R.D.Walton,Jr. (Office of Defense Waste & Byproducts Management, US DOE, Washington, DC, USA), W.B.Wilson, D.E.Gordon.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.307-11
Several candidate waste forms have been investigated under US Department of Energy (DOE) programs as potential media for the immobilization and geologic disposal of high-level radioactive waste (HLW) resulting from chemical processing nuclear reactor fuels and targets. Two of these HLW forms were selected at the end of fiscal year (FY) 1981 for further development. Borosilicate glass was continued as the reference waste form and a crystalline ceramic material, Synroc, was selected as the alternative form. The selection of one of these two forms for production in the Defense Waste Processing Facility (DWPF) at the Savannah River Plant site will be made before the end of FY 1983. This paper focuses on the selection of these two waste forms, including discussions on the historical perspectives of HLW treatment and disposal, the Materials Characterization Organization, and the evaluation method used in the selection process. (10 refs.)

106015 Demonstration of SYNROC fabrication scaleup on a non-radioactive basis. E.J.Ramm, K.D.Reeve (AAEC Res. Establ., Lucas Heights Res. Labs., Sutherland, NSW, Australia).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.312-17
SYNROC fabrication development at Lucas Heights is based on hot uniaxial pressing, and a method known as in-can hot pressing was devised for the first scaleup demonstration. The present in-can hot press consists of a 1 m long induction furnace into which a 115 mm diameter stainless steel tube can be fitted and provided with lateral support, together with associated hydraulics. Five 30 kg canisters of dense SYNROC-B have been produced and the method is considered suitable for further development. Current plans for continuing SYNROC process development at Lucas Heights are outlined. (9 refs.)

106016 Immobilization of high-level defense wastes in SYNROC-D: recent research and development results on process scale-up. J.H.Campbell, R.B.Rozsa, C.L.Hoenig (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.318-24
SYNROC is a titanate-based ceramic waste form being developed to immobilize high-level nuclear reactor wastes. SYNROC-D is a unique variation of SYNROC designed to contain high-level defense wastes, particularly those in storage at the Savannah River Plant (SRP). The authors review recent research and development on SYNROC-D processing options and report on work in progress on various unit operations. (14 refs.)

106017 An improved polyphase ceramic for high-level defense waste. A.B.Harker, P.E.D.Morgan, J.Flintoff, D.R.Clarke (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.325-30
Modifications of the chemical formulation and processing of the SYNROC-D polyphase ceramic for defense waste have been studied to provide greater flexibility with respect to compositional variations in the waste and to improve leach resistance. It has been demonstrated that by applying only that amount of reduction to the waste required to produce uranium in the 4+ state and by using lower consolidation temperatures, an improved ceramic can be formed. The resulting ceramic consolidated at 1040°C and 10000 p.s.i. maintains the SYNROC-D zirconolite, perovskite and nepheline phases; however, the two SYNROC-D spinel phases are replaced with a single magnetite-type spinel and two additional radiophases, magnetoplumbite, and a cubic murataite-type phase. This modified phase assemblage provides crystalline host sites for all radionuclides and trace elements in SRP waste, minimizes amorphous intergranular material, and shows superior leach resistance. (14 refs.)

106018 High level waste forms: glass marbles and thermal spray coatings. R.L.Treat, K.H.Oma, S.C.Slate (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.331-5
A process that converts high-level waste to glass marbles and then coats the marbles has been developed at Pacific Northwest Laboratory (PNL) under sponsorship of the US Department of Energy. The process consists of a joule-heated glass melter, a marble-making device based on a patent issued to Corning Glass Works, and a coating system that includes a plasma spray coater and a marble tumbler. The process was developed under the Alternative Waste Forms Program which strived to improve upon monolithic glass for immobilizing high-level wastes. Coated glass marbles were found to be more leach-resistant, and the marbles, before coating were found to be very homogeneous, highly impact resistant, and conducive to encapsulation in a metal matric for improved heat transfer and containment. Marbles are also ideally suited for quality assurance and recycling. However, the marble process is more complex, and marbles require a larger number of canisters for waste containment and have a higher surface area than do glass monoliths. (5 refs.)

106019 Evaluation of coated particle waste forms. T.D.Gulden, O.D.Erlandson, J.L.Kaae, W.J.Kovacs (General Atomic Co., San Diego, CA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.336-40
An in-depth evaluation of the technical merits and engineering practicality of coated particles, based on sol gel processes, as a candidate waste form has been performed. The results of the study showed that coated particle waste forms, because of the exceptional chemical inertness of the carbon and silicon carbide coatings, have the potential for nearly absolute containment of radionuclides for geologic time periods. The processes, although somewhat complex, are amenable to remote operation, and have considerable potential for further development and simplification. Coated particle fuels have inherent advantages for quality control sampling and are readily recycled for rework. (8 refs.)

106020 Factors to be taken into account in the selection and application of a processing system for TRU waste. H.Krause (Kernforschungszentrum Karlsruhe GmbH, Inst. fur Nukleare Entsorgungstech., Karlsruhe, Germany).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.343-6
The greatest portion of presently arising TRU waste is either treated like other radwastes or stored intermediately. A large fast-breeder fuel cycle will call for a particular, self-contained TRU-waste treatment system. Its main characteristics should be minimization of waste arisings, volume reduction, separation of plutonium and other actinides where reasonably achievable, recycling of plutonium, and incorporation of the TRU-waste concentrates into adequate matrix materials. Most of the processes and waste forms required are already available or under development. (17 refs.)

106021 State-of-the-art review on the management of low-level radioactive and transuranic wastes. H.W.Godbee, A.H.Kibbey (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.347-51
To place the management of low-level and transuranic wastes in perspective, the amounts of each waste type buried in 1980 and accumulated (with locations) through 1980 are presented. A review of the basic unit operations used to remove radioactivity from process and liquid waste streams shows that filtration, evaporation, and ion exchange remain the dominant ones. Centri-

fugation is frequently used to dewater filter sludges and spent resins. In the United States at present, dry wastes are, for the most part, compressed (compactor or baler) for burial. However, the present trend in waste management is toward greater volume reduction, improved waste form stability, and longer onsite storage (viz., at commercial sites). Thus, use of and interest in calcination, incineration, incorporation of wastes into stable matrices, and engineered onsite storage is growing. (13 refs.)

106022 Treatment of TRU wastes: recent results of developments underway in Germany. V.W.Schneider, F.W.Ledebrink (ALKEM GmbH, Hanau, Germany).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.352-6

Objectives and projects of the German program on TRU waste treatment are briefly reviewed. Three tasks (Studies of TRU Waste Management, Development of Washing Processes, and An Improved Process for Solidification by Cement) are outlined in more detail. Recent results are communicated and the properties of the solidified products provided. Finally, a Scheme for Treatment of TRU waste from a MOX Fuel Fabrication Plant is presented. (7 refs.)

106023 Long term management of USDOE transuranic waste. W.S.Bennett, K.V.Gilbert (Rockwell Internat., Rocky Flats Plant, Golden, CO, USA), R.Y.Lowrey.

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.357-60

Operations of the USDOE and its predecessor agencies have generated large quantities of waste materials contaminated with transuranic (TRU) elements. These wastes were originally managed by shallow land burial. In 1970 a change in policy occurred which required that wastes contaminated with TRU elements above 10 nCi/gm be placed in retrievable storage pending development of a permanent isolation method. The policy change occurred because of concern that the high radiotoxicity of many TRU isotopes, combined with their long halflives, might pose a threat to the health and safety of future generations. (5 refs.)

106024 Transuranic Waste Treatment Facility design alternates. A.L.Ayers,Sr. (EG&G Idaho Inc., Idaho Falls, ID, USA).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.361-4

The Transuranic Waste Treatment Facility (TWTF) will process transuranic (TRU) waste in retrievable storage at the Idaho National Engineering Laboratory (INEL). The costs for a TWTF concept using a slagging pyrolysis incinerator were excessive. Alternate concepts using a slow speed shredder, a rotary kiln incinerator, and concrete immobilization should result in significant cost reductions. These will be included in future TWTF considerations. (no refs.)

106025 Volume reduction and solidification of low radioactive and plutonium waste—technology and operation experience. K.-G.Hackstein (NUKEM GmbH, Hanau, Germany).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.365-8

The author deals mainly with the volume reduction and solidification of radioactive waste generated from nuclear power plants, but also includes the work which has been done to reduce the volume of plutonium bearing waste generated by fuel-fabrication plants. (no refs.)

106026 Recent advances in power plant radwaste volume reduction systems and end product characteristics. J.A.Blewett (Atcor Engineered Systems Inc., Farmington, CT, USA), M.Van Dorpe.

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.371-6

The preconditioning of nuclear power plant liquid wastes is of vital importance if the volumes, decontamination factors (DF) leachability and ability to solidify the wastes is to be optimized during the Volume Reduction Process. Extensive testing conducted by Belgonucleaire (BN) and ATCOR in the development of the ATCOR/BN Volume Reduction System has proven the benefits of the chemical pretreatment as a major part of the Volume Reduction Process. (no refs.)

106027 Development of chemical methods of radioactive waste management for UK power reactor sites. D.Bradbury (Berkeley Nuclear Labs., CEGB, Berkeley, England).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.377-80

Chemical processing can be beneficial in the management of medium level radioactive waste. The purpose of such processing is to reduce the volume of the waste, to separate active components from inactive components, or to change the waste's chemical form to make it more amenable to safe disposal. This paper describes two chemical techniques which are currently being developed to assist in the management of radioactive waste from the UK's Magnox Power Reactor sites. The first case concerns regeneration and reuse of cesium-selective ion exchange materials and in the second case a process is described for selectively dissolving Magnox alloy waste in carbon dioxide saturated water as a means of separating it from active components. (5 refs.)

106028 Removal of radioactive materials from waste solutions via magnetic ferrites. T.E.Boyd, R.L.Kochen, M.Y.Price (Rockwell Internat., Rocky Flats Plant, Golden, CO, USA).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.381-4

Ferrite waste treatment was found to be effective in removing actinides from simulated Rocky Flats process waste solutions. With a one-stage ferrite treatment, plutonium concentrations were consistently reduced from 10^{-4} g/l to less than 10^{-8} g/l and americium concentrations were lowered from 10^{-7} g/l to below 10^{-10} g/l. In addition, significantly less solid was produced as compared with the flocculant precipitation technique now employed at Rocky Flats. Aging of ferrite solids and evaluated beryllium and phosphate concentrations were identified as interferences in the ferrite treatment of process waste, but neither appeared serious enough to prevent implementation in plant operations. (8 refs.)

106029 Removal of cesium from a salty, aqueous waste with sodium tetraphenyl boron. W.H.Bond, M.K.Williams, C.M.Colvin, G.L.Silver (MRC-Mound; Miamisburg, OH, USA).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.385-9

A process for the coprecipitation of cesium-137 with potassium, using sodium tetraphenyl boron, from a salty, aqueous, low-level radwaste was developed and successfully conducted. Potential treatments for cesium removal from the waste were first evaluated. As a result of this evaluation (which compared a number of factors including cost, safety, equipment availability, and decontamination) physical separation techniques and adsorbents were eliminated. Two chemical treatments involving sodium tetraphenyl boron and copper ferrocyanide were further tested. Treatment with sodium tetraphenyl boron was chosen and successfully reduced the cesium-137 concentration in the supernatant of the waste from 570 to 4 counts/min/ml. (5 refs.)

106030 Improved radwaste economics and operating performance by use of the etched disc backflushable filter. B.V.Coplan (BVC Consultants Inc., Sun City Center, FL, USA).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.390-4

Filtration of liquid radwaste streams is a basic unit operation for liquid radwaste management systems at nuclear power plants and other nuclear facilities. Traditionally, PWRs, for most of their filtration applications, have used disposable cartridge filters, while BWRs have generally used pressure precoat filters. A filter, etched disc backflushable filter, has been developed which eliminates, or greatly reduces, the problems and operating expenses encountered with cartridge and precoat filters. It has shown, in over five years of continuous online service, that it is both efficient and reliable and should be considered for any new or retrofit filtration application in radioactive liquid processing. The author presents summaries of some economic analyses made by utilities, or in some cases by their architect/engineers, for specific new and retrofit installations. The studies were made to determine if replacing a cartridge filter with an etched disc backflushable filter would be economically attractive. (4 refs.)

106031 The new aqueous waste treatment facility at Rocky Flats. K.G.Peter (Rockwell Internat., Rocky Flats Plant, Golden, CO, USA).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.395-7

The new waste treatment facility at Rocky Flats, Building 374, is designed to remove radioactive and chemical contaminants from aqueous process effluents collected from operations throughout the plant. By utilizing evaporation as well as precipitation, flocculation, and clarification, plant wastes are converted into reusable distilled water, disposable and retrievable solids, and exhaust gases. Total average capacity of the facility is 14900 l/hr as evaporator feed, producing an average of 80 kg/hr of dried sludge and 320 kg/hr of evaporator salts. (1 ref.)

106032 Remote aspects of treating and handling radioactive wastes. K.Wegner (NUKEM GmbH, Hanau, Germany).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.413-17

Carrying out detailed handling analysis on process components is the only way to get a fundamental basis for the choice of handling concepts. It is necessary to set up methods for the procedure of handling analysis in a systematic, uniform and checkable way. Large hot cell concepts promise a lot of advantages, but these concepts live and die with the availability of suitable handling equipment. High emphasis has to be put into the development of this special equipment. (no refs.)

106033 The defense waste processing facility a remote process for solidification of Savannah River Plant high level waste. R.Maher, L.F.Shafranek, J.A.Kelley, R.W.Zeyfang, A.J.Lethco (E.I. du Pont de Nemours & Co., Savannah River Plant, Aiken, SC, USA).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.421-30

The Department of Energy (DOE) is proposing that a defense waste processing facility (DWPF) be built at the Savannah River Plant (SRP) to remotely process and immobilize high level radioactive waste produced at the site. Research, development and design of the facility is being provided by a multidisciplined task force of personnel from the Du Pont Company which designed, built and has operated SRP since 1950. This remotely operated facility will immobilize 28 million gallons of high level waste now stored in tanks, plus the waste to be generated from continued reprocessing operations. Borosilicate glass has been selected as the reference waste form for the immobilization process. (no refs.)

106034 SRP radioactive glass studies: small-scale process development and product performance. M.J.Plodinec, P.D.Soper, N.E.Bibler, J.L.Kessler (E.I. du Pont de Nemours & Co., Savannah River Lab., Aiken, SC, USA).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.431-4

The Savannah River Plant has been producing defense nuclear materials for over 25 years. Radioactive wastes from chemical separation processes have accumulated during this time and now amount to approximately 25 million gallons, all of which is stored in underground tanks on the plant site. The Savannah River Laboratory (SRL) has been actively investigating methods of immobilization of these wastes. Recent results are reviewed. These results show that the slurry-fed melting process can immobilize a wide range of waste compositions with minimal effluents at acceptable production rates. A small-scale joule-heated ceramic melter contained in the Shielded Cells Facility has demonstrated the vitrification process for actual Savannah River Plant radioactive waste. Losses of radionuclides due to volatility are low and easily treated, and the glass produced is of comparable quality to laboratory-prepared simulated glass. Future work will include studies with wastes from other tanks, using new frit compositions. Leaching tests will continue, with emphasis being placed on long-term tests under anticipated repository conditions. (6 refs.)

106035 Spray calcination of SRP waste compositions for ceramic waste forms. L.F.Grantham, J.F.Flintoff (Energy Systems Group, Rockwell Internat. Corp., Canoga Park, CA, USA).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.435-8

A heated-gas calciner produces a reactive powder suitable for ceramic immobilization of nuclear waste. This spray calciner has the added advantages of simultaneously destroying nitrates and organics in the waste. In addition, chemical tailoring as well as valence control were also accomplished during the calcination step. Though spray calcination remains the reference calcination method, Rockwell and LLNL are investigating alternate calcination methods for ceramic immobilization of nuclear waste. (8 refs.)

106036 High level waste management at the Idaho Chemical Processing Plant. J.R.Berreth, B.R.Dickey (Exxon Nuclear Idaho Co., Idaho Falls, ID, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.439-44
The paper summarizes past and current high-level waste management practices at the Idaho Chemical Processing Plant (ICPP); options for long-term waste management of existing and future waste calcine are also emphasized. (17 refs.)

106037 High level waste management and characterization at the Hanford plant site. J.L.Deichman (Rockwell Hanford Operations, Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.449-52
Of the total 540-million curie fission product inventory at Hanford in 1981, 99% was generated as high-level waste. Methods of storing this inventory and methods for reducing the volume of this inventory are discussed. (2 refs.)

106038 10 CFR 61 waste form requirements. T.C.Johnson, P.H.Lohaus, R.D.Smith (US Nuclear Regulatory Commission, Washington, DC, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.455-6
The Nuclear Regulatory Commission (NRC) staff is preparing a regulation on low-level radioactive waste management, 10 CFR 61. The performance objectives of this regulation stress: 1) the long-term stability of the disposal site to minimize water infiltration into trenches and to minimize remedial maintenance operations, and 2) the protection of individuals as well as populations. Based on these objectives, a waste classification system has been developed which is used for determining the waste form requirements for specific wastes. (no refs.)

106039 Radioactive waste: commercial disposal practices. J.J.Scoville (US Ecology Inc., Louisville, KY, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.457-9
Commercial low-level radioactive waste is disposed at three commercial disposal facilities. These facilities differ from each other climatically as well as in hydrological and geological characteristics. Therefore, the individual sites must tailor the conduct of operations and the method of waste burial to provide for the proper long-term burial of low-level radioactive waste. This paper briefly examines the current disposal practices utilized at US Ecology's Beatty, Nevada and Richland, Washington disposal facilities. (1 ref.)

106040 Barnwell low-level waste disposal operations. D.G.Ebenhack (Chem-Nuclear Systems Inc., Bellevue, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.460-1
The CNSI burial facility is one of three operating commercial shallow-land burial disposal sites available to generators of low-level radioactive waste. The Barnwell facility was originally licensed in early 1971 and has been in operation since then. It is located in South Carolina's coastal plain adjacent to the eastern boundary of DOE's Savannah River Project and Allied General's reprocessing facility. The facility encompasses an area of approximately 300 acres, of which 47 acres have been utilized for disposal to date with a remaining acreage available for burial of approximately 160 acres. The remaining acreage not designated for future burial activities is utilized for administrative and operation areas and as a buffer zone surrounding the site. The author discusses some of the past, present and future trends in Barnwell waste disposal operations. (no refs.)

106041 Alternatives for future land disposal of radioactive waste. C.W.Mallory (Hittman Nuclear & Dev. Corp., Columbia, MD, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.462-5
The first commercial radioactive waste disposal site was opened in Beatty, Nevada in 1962. Since that time five other sites have been opened and three of the six are now closed. All of the commercial radioactive waste sites have been shallow land burial sites. Of these six shallow land burial sites that have been opened two are located in arid regions having permeable soils, two are located in humid areas with permeable soils, and two are located in humid areas with the trenches over impervious strata. The latter two sites located at Morehead, Kentucky and West Valley, New York have been closed. In addition the site at Sheffield, Illinois was closed when a license to open additional trenches was not granted and the costs of conducting additional hydrogeologic investigations became prohibitive. The paper discusses the conditions leading to the closures of these sites and the actions that will be necessary to decommission shallow land burial sites. It also considers alternative methods for the disposal of low-level radioactive waste in the future. (no refs.)

106042 Novel experiments for understanding the shallow-land burial of low-level radioactive wastes. G.L.DePoorter, W.V.Abeele, T.E.Hakonson, B.W.Burton, B.A.Perkins (Environmental Sci. Group, Los Alamos Nat. Lab., Los Alamos, NM, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.466-70
Three field experiments that will provide data on water movement in SLB facilities are described. The experiments are designed to measure water movement, to quantify techniques to control water movement, and to determine the effects of surface moisture content fluctuations on liquid and vapor movement back to the surface. (5 refs.)

106043 Evaluation of geologic materials to limit biological intrusion of low-level waste site covers. T.E.Hakonson, G.C.White, E.M.Karlen (Environmental Sci. Group, Los Alamos Nat. Lab., Los Alamos, NM, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.471-6
Reports the preliminary results of a screening study to determine the effectiveness of four biobarrier materials to stop plant root and animal penetration into simulated low-level wastes. Experiments employed 288 lysimeters consisting of 25-cm-diameter PVC pipe, with four factors tested: plant species (alfalfa, barley, and sweet clover); top soil thickness; biobarrier material (crushed tuff, bentonite clay, cobble, and cobble-gravel; and biobarrier thickness (clay—15, 30, and 45 cm, others 30, 60, and 90 cm). The crushed tuff, a sandy backfill material, offers little resistance to root and animal intrusion through the cover profile, while bentonite clay, cobble, and cobble-gravel combinations do reduce plant root and animal intrusion through cover profiles. However, desiccation of the clay barrier by invading plant roots may limit the usefulness of this material as a moisture and/or biological barrier. The cobble-gravel combination appears to be the best candidate for further testing on a larger scale because the gravel helps impede the migration of soil into the cobble layer—the probable cause of failure of cobble-only biobarriers. (15 refs.)

106044 In-situ stabilization of a low-level radioactive site—a case history. A.A.Metry, D.R.Phoenix (Roy F. Weston Inc., Designers-Consultants, West Chester, PA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.477-84
The US DOE is considering several methods for carrying out remedial actions in Canonsburg, Pennsylvania, at the site of an inactive uranium-processing mill. The main objective of this study is to determine the feasibility of in-situ stabilization as the remedial action. In-situ stabilization is an alternative to site decontamination and offsite disposal. The problems associated with offsite hauling of large quantities of contaminated material and with the location and development of a new disposal site could be avoided by the implementation of an in-situ stabilization concept. In addition, the in-situ approach would be more cost-effective than offsite disposal. This study will establish that a technically feasible and implementable in-situ stabilization concept can be developed that meets regulatory requirements and is cost-effective. (6 refs.)

106045 Mound pelletized waste form demonstration program. E.L.Lewis, R.F.Herbert,Jr., J.W.Doty,Jr. (MRC-Mound, Miamisburg, OH, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.487-92
During the past 4 years, an immobilized waste matrix has been under development at Mound. The matrix is a cold pressed, high density, low porosity pellet which is composed of Portland 1A cement, the waste material, water, and in some cases, special additives. The waste materials immobilized include incinerator ash and associated sludge produced in the incinerator off-gas system. Initially, nonradioactive pellets were produced in laboratory-scale experiments. Pilot-scale experiments were next performed using 'Pu-238 oxide' contaminated ash and sludge. Sample pellets were tested for compressive strength, leachability, and gas generation. Finally, a production system was designed and built, and it is now producing plutonium-contaminated waste/cement pellets on a routine basis. (12 refs.)

106046 Immobilization of Rocky Flats wastes using the inert carrier process. P.M.Arnold, J.A.Ledford (Rockwell Internat., Rocky Flats Plant, Golden, CO, USA), M.Kasahara, S.A.Hobart.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.493-6
A demonstration plant to solidify transuranic waste has been designed for Rockwell International's Rocky Flats Plant. This solidification system was designed by Quadrex Corporation with support from United Technologies Corporation and was based on the inert carrier process technology developed by United Technologies Corporation (UTC). These three companies have worked together towards the development of a unique transuranic waste immobilization system. The demonstration plant has been designed and sized to be used as an experimental test unit with the option of converting the system to a continuous production plant. The demonstration plant will test the use of freon TF as an inert carrier and cement as a binding agent. Freon was suggested as the carrier since it is nonflammable and is currently used at the Rocky Flats site as a solvent; cement was considered as the most desirable binder since it is readily available and relatively inexpensive. (no refs.)

106047 Solidification of ion exchange resin wastes in hydraulic cement. R.Neilson,Jr., P.Kalb, M.Fuhrmann, P.Colombo (Dept. of Nuclear Energy, Brookhaven Nat. Lab., Upton, NY, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.497-503
Work has been conducted to investigate the solidification of ion exchange resin wastes with Portland cements. These efforts have been directed toward the development of acceptable formulations for the solidification of ion exchange resin wastes and the characterization of the resultant waste forms. The paper describes formulation development work and defines acceptable formulations in terms of ternary phase compositional diagrams. The effects of cement type, resin type, resin loading, waste/cement ratio and water/cement ratio are described. The leachability of unsolidified and solidified resin waste forms and its relationship to full-scale waste form behavior is discussed. Gamma irradiation was found to improve waste form integrity, apparently as a result of increased resin crosslinking. Modifications to improve waste form integrity are described. (7 refs.)

106048 The feasibility of incinerating and vitrifying organic resins in a single step. J.L.Buelt (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.504-9
Pacific Northwest Laboratory has completed a feasibility testing program for a process designed to incinerate and vitrify the inorganic and radionuclide components of EPICOR II resins in a single step. The process tests utilized pilot-scale, high-level waste vitrification equipment with a special feeding technique that forces contact of the combustible resins with molten glass. This technique demonstrated high retention of nonradioactive forms of cesium and strontium in the glass product. Other performance evaluations of the process were also favorable. (7 refs.)

106049 The applications of iron-enriched basalt to TMI radioactive waste disposal. D.E.Owen, J.M.Welch, P.V.Kelsey, J.E.Flinn (EG&G Idaho Inc., Idaho Falls, ID, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.515-22
Iron-enriched basalt (IEB), a man-made analogue to natural basalt, has been investigated as a dissolution and immobilization medium for Three Mile Island (TMI) radioactive wastes. The research has focused on the ability of IEB, a glass-ceramic whose principal constituents are SiO_2, Fe_2O_3+FeO, and Al_2O_3, to contain TMI zeolites, resins and core debris, and on the practical aspects of producing IEB on a large scale using a joule-heated melter. The retention of cesium and strontium during high-temperature processing of IEB and the leach rate of these species from IEB in 363K deionized water have been investigated. Simulated TMI core debris (UO_2, Zircaloy, and stainless steel) have been successfully dissolved in IEB by using an air bubbler to

accelerate the dissolution process. Large-scale IEB castings (10 kg and 75 kg) incorporating simulated TMI wastes have been prepared using a 250 kg capacity joule-heated research melter. Subjecting the castings to a controlled cooling produced fine grained monoliths with almost no microcracks. (7 refs.)

106050 Economics of transuranic waste immobilization and disposal. C.L.Timmerman (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.523-7
Seven proposed transuranic (TRU) waste immobilization systems are assessed and evaluated on the basis of costs. Specific cost components that are estimated include processing costs, transportation costs, and repository or disposal costs. Economics are examined to determine the effects that each component has on the system costs. The evaluation led to two recommended systems based on these cost component evaluations. A cast-cement system is recommended for immobilized TRU wastes disposed in a defense-related waste repository because of lower processing costs and a reduced incentive for waste volume reduction. The joule-heated glass system is recommended for the immobilized TRU wastes placed in a commercial waste repository since the increased disposal cost places a greater emphasis and value upon an immobilization system which provides a large volume reduction. (6 refs.)

106051 West Valley demonstration project—strategy for an achievable but challenging project. J.P.Hamric (Dept. of Energy, Idaho Operations Office, Idaho Falls, ID, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.531-3
The West Valley facility, a shutdown reprocessing plant, was taken over by West Valley Nuclear Services Co. Inc. in February 1982. The reopening of the facility for a waste management demonstration project has now reached the stage of identifying all links in the chain for solidification, storage and shipment of high level waste. (no refs.)

106052 Present status of the West Valley demonstration project. J.L.Knabenschuh.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.534-6
The West Valley project is to demonstrate cost-effective and safe commercial high-level waste immobilisation. The author discusses the waste forms, process development and safety documentation for this project. (no refs.)

106053 Evaluation of process alternatives for solidification of the West Valley high-level liquid wastes. L.K.Holton, D.E.Larson (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.537-41
The Department of Energy established the West Valley Solidification Project in 1980. The project purpose is to demonstrate removal and solidification of the high-level liquid wastes presently stored in tanks at the Western New York Nuclear Service Center (WNYNSC). As part of this effort, the Pacific Northwest Laboratory conducted a study to evaluate process alternatives for solidification of the WNYNSC wastes. Two process approaches for waste handling before solidification, together with solidification processes for four terminal and four interim waste forms, were considered. The first waste-handling approach, designated the salt/sludge separation process, involves separating the bulk of the nonradioactive nuclear waste constituents from the radioactive waste constituents, and the second waste-handling approach, designated the combined-waste process, involves no waste segregation prior to solidification. The processes were evaluated on the bases of their readiness for plant startup by 1987, relative technical merits, and process cost. The study has shown that, based on these criteria, the salt/sludge separation process with a borosilicate glass waste form is preferred when producing a terminal waste form. It was also concluded that if an interim waste form is to be used, the preferred approach would be the combined waste process with a fused-salt waste form. (7 refs.)

106054 An evaluation of the AVM process and its applicability to West Valley. W.A.Cameron, S.Merlin.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.542-6
The author introduces the French program for the vitrification of high level nuclear wastes. The reasons for the advanced state of the program are briefly discussed and some indication of the relation between the French program and the situation at West Valley is provided. (no refs.)

106055 High-level waste solidification system for the Western New York Nuclear Service Center. J.R.Carrell, L.K.Holton, D.H.Siemens (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.547-52
A preconceptual design for a waste conditioning and solidification system for the immobilization of the high-level liquid wastes (HLLW) stored at the Western New York Nuclear Service Center (WNYNSC) was completed in 1981. The preconceptual design was conducted as part of the Department of Energy's West Valley Demonstration Project, which requires a waste management demonstration at the WNYNSC. The authors summarize the bases, assumptions, results and conclusions of a preconceptual design study of a solidification system designed for installation in existing facilities. (1 ref.)

106056 Low level waste management—a brief overview of the Western European countries. L.Mergan, M.Vandorpe (Belgonucleaire, Brussels, Belgium).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.555-8
A review of the low level waste management in the Western European countries is presented. It is found that 97 nuclear power plants are already operating, only 34 are provided with onsite radwaste encapsulation, and 85% of them use cement as solidification matrix. Governments of the most active countries have created specific governmental organizations who will be responsible for storage and final disposal of the conditioned wastes. (no refs.)

106057 Separation of nonradioactive wastes from wastes of low specific radioactivity. A.N.Sinclair (Nuclear Generation Div., Ontario Hydro, Toronto, Ontario, Canada).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.559-63
A sorting program is proposed to separate mildly-contaminated waste into radioactive and nonactive components. Benefits would include a considerable reduction in space required for indefinite storage of radioactive waste, and a corresponding reduction in costs. Potential engineering problems in various parts of the program, and methods for dealing with them, are discussed. These areas of concern include waste collection, monitoring standards and equipment, the mechanics of the actual sorting process, and performance verification. (no refs.)

106058 Current status of low-level waste segregation technology. D.E.Clark, P.Colombo, V.L.Sailor (Dept. of Nuclear Energy, Brookhaven Nat. Lab., Upton, NY, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.564-70
The state-of-the-art of LLW segregation technology and current practices in the USA have been surveyed at representative facilities. Favourable experience has been reported at various sites following the application of segregation controls. Efficient segregation of nonradioactive waste from radioactive wastes at the point of generation can drastically reduce the volume and cost of waste requiring treatment and disposal. Segregation of wastes can also lead to more efficient waste processing by which, for example, personnel exposures can be reduced and solidification can be directed towards certain 'problem' wastes. The authors report on the state-of-the-art survey and address current and projected LLW segregation practices and their relationship to other waste management activities. (21 refs.)

106059 Figure-of-merit analysis and cost-effectiveness of low-level radioactive waste treatment systems. N.D.Cox, K.L.Falconer, M.D.McCormack (EG&G Idaho, Idaho Falls, ID, USA), H.D.Hootman, T.K.Thompson.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.571-7
Two studies were performed to assess low-level waste treatment systems that are available commercially for volume reduction and/or solidification. In the first, a figure-of-merit decision analysis technique was used to evaluate fourteen low-level radioactive waste processing systems on their ability to treat power reactor wastes. The system judged superior to all the others was compaction of dry wastes with liquid wastes and sludges being directly incorporated into concrete; this was also the lowest cost system. In the second study, the cost economy of volume reduction measured in land disposal dollars was investigated. The greatest cost savings with volume reduction were realized with a BWR using a deep bed condensate polishing system; the least was with a PWR with condensate polishing. (7 refs.)

106060 Design of the CRNL radwaste solidification plant. W.H.Pettipas (Chalk River Nuclear Labs., AECL Res. Co., Chalk River, Ontario, Canada).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.578-81
Solid and liquid effluents from Canadian reactor systems and laboratories can contain widely varying quantities and species of radioactive solids and chemicals. Presently solid wastes are stored, while liquid wastes are diluted and dispersed, if possible. Those wastes which cannot be dispersed are stored in tanks for a suitable decay period. The Chalk River Nuclear Laboratories have been developing and refining volume reduction and activity immobilization techniques in support of the Canadian nuclear power program. A Waste Treatment Centre (WTC) has been constructed at CRNL to house volume reduction and immobilization systems which will treat liquid and solid wastes originating at, and transported to, CRNL. The Radwaste Solidification Plant (RSP) is housed in the WTC and handles liquid and combusted solid wastes. Liquids are accepted into the plant for concentration and mixing with bitumen in a wiped-film evaporator, Solid wastes in the form of incinerator ash are mixed with bitumen in a ribbon blender. The products of these two processes are placed in galvanized steel 210 L drums and then sealed. These product drums, once sealed, are transferred to the interim storage building where they are held pending shipment to a repository. (2 refs.)

106061 Implications of pathway analysis of deminimus concentrations of radioactive waste. J.R.Mernagh, P.J.Dinner, L.R.Olden, R.G.Tulk.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.582-6
The authors present the results of pathway analysis performed to assess the possible exposures resulting from the disposal of waste which may contain small quantities of artificially produced or enhanced radioactivity into sanitary landfill sites. The four pathways considered are external exposure, dust inhalation, food, and water ingestion. The proposed level of 100 pCi/g as the limit below which waste would be considered nonradioactive was found to produce a dose rate to members of the critical group of less than the suggested minimus level of 10 mrem/a^1 under conservative exposure conditions, and less than 1 mrem/a^1 with more realistic assumptions. (15 refs.)

106062 Transportation system (TRUPACT) for contact-handled transuranic wastes. L.E.Romesberg, R.B.Pope (Transportation Technol. Center, Sandia Nat. Labs., Albuquerque, NM, USA), R.M.Burgoyne.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.589-94
Contact-handled transuranic defense waste is being, and will continue to be, moved between a number of locations in the United States. The DOE is sponsoring development of safe, efficient, licensable, and cost-effective transportation systems to handle this waste. The systems being developed have been named TRUPACT which stands for TransUranic PACkage Transporter. The system will be compatible with Type A packagings used by waste generators, interim storage facilities, and repositories. TRUPACT is required to be a Type B packaging since larger than Type A quantities of some radionuclides (particularly plutonium) may be involved in the collection of Type A packagings. TRUPACT must provide structural and thermal protection to the waste in hypothetical accident environments specified in DOT regulations 49CFR173 and NRC regulations 10CFR71. Preliminary design of the systems has been completed and final design for a truck system is underway. The status of the development program is reviewed and the reference design is described. Tests that have been conducted are discussed and long-term program objectives are reviewed. (5 refs.)

106063 Transportation packaging for processed transuranic waste. W.B.Andrews (Pacific Northwest Lab., Richland, WA, USA), R.H.Jones.
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.595-600
This project was to develop design criteria and packaging design concepts for transportation of processed TRU (PTRU) waste products with surface dose rates 2 mSv/hr (200 mR/hr). Two transportation categories are potentially feasible for waste forms considered in this project under proposed revisions to US transportation packaging regulations. These include low level solids and

type B packagings. Much uncertainty remains on final design criteria due to current trends in material performance requirements and packaging construction economics. However, preliminary estimates indicate large economic benefits to designing a combination transportation/disposal packaging. (7 refs.)

106064 Defense TRU waste transportation and receiving simulation. R.L.Engel, P.M.Daling (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.601-5
Pacific Northwest Laboratory has recently conducted a simulation analysis to predict the transportation and waste handling equipment requirements for transporting government owned transuranic waste to the Waste Isolation Pilot Plant (WIPP). Two interrelated models were developed. One estimates the time required to receive and unload shipping containers at the WIPP. The other model uses this estimate to predict the number of shipping containers and transporters that will be required. (5 refs.)

106065 Process and transportation safety evaluation of a synthetic basaltic waste form. R.P.Sandoval, W.B.Leisher (Transportation Technol. Center, Sandia Nat. Labs., Albuquerque, NM, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.606-10
Tests were performed to address two areas of concern: the response of a slagging-pyrolysis incineration (SPI) processed transuranic waste form to realistic process handling and transportation accident scenarios, and the quantity of particulate production of the SPI processed waste form subjected to Type A packaging test conditions. Several tests were performed to provide preliminary data to assess the qualifications of SPI transuranic waste forms as a DOT proposed low-level solid. Test results indicate that the SPI waste form and canister are capable of satisfying the Type A test conditions specified for the new proposed low-level solids (LLS) category. (5 refs.)

106066 Overview of waste-handling requirements for a nuclear waste repository in basalt. R.J.Gimera, J.M.Davis (Rockwell Hanford Operations, Basalt Waste Isolation Project, Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.611-22
The Basalt Waste Isolation Project (BWIP) has the responsibility for assessing the feasibility of using the deep basalts beneath the Hanford Site as a medium for nuclear waste disposal, as part of the National Waste Terminal Storage program. The authors discuss the waste handling system for spent fuel canisters; the waste-handling building, the receiving facilities, the hot cell, the transfer cask, the transfer-cask transporter, and radwaste management are considered. (no refs.)

106067 Operational features of the waste isolation pilot plant (WIPP). R.K.Brown, V.F.Likar (Westinghouse Electric Corp., Tech. Support Contractor, Pittsburgh, PA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.623-7
The Department of Energy plans to construct the Waste Isolation Pilot Plant (WIPP) in southeast New Mexico. The facility will retrievably store transuranic waste from defense activities of the United States and conduct experiments with defense high level waste which would be retrieved at the end of the experiments. The authors describe the handling of the transuranic waste, both by contact and by remote handling methods. It also describes the arrangement of the shaft and the underground ventilation system, and the protection provided during surface handling of the waste. Finally, the present status of construction at the WIPP site is discussed. (no refs.)

106068 Requirements for certifying TRU waste for the WIPP. R.J.Merlini, D.W.Rutherford (Rockwell Internat., Rocky Flats, Golden, CO, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.628-31
The authors identify and describe the requirements associated with the certification of TRU waste for acceptance at the Waste Isolation Pilot Plant (WIPP). These requirements specify what a transuranic waste generating site must accomplish to establish a waste certification program and produce certified TRU waste. Certification basically requires that the waste generation sites establish a certification program that controls and demonstrates that all the waste characteristics identified by the WIPP Waste Acceptance Criteria (WAC) are met for site waste. 28.42H Fuel preparation and reprocessing
(inc. isotope separation and enrichment)

106069 Preparation of thorium metal sponge from thorium oxalate. P.L.Vijay, J.C.Sehra, C.V.Sundaram, K.R.Gurumurthy, R.V.Raghavan (Bhabha Atomic Res. Centre, Bombay, India).
Trans. Indian Inst. Met., vol.35, no.2, p.143-7 (April 1982). [received: Aug. 1983]
Deals with the laboratory scale preparation of high purity thorium metal by magnesium reduction of thorium tetrachloride. In the preparation of thorium tetrachloride from thorium oxalate, studies have been made to optimise chlorination conditions with various chlorinating agents such as CO-Cl_2, CO_2-CCl_4 and Cl_2-CCl_4. The quality of the sponge obtained from single and double distilled chloride has been assessed. The overall process efficiency under the optimum conditions was 81%. Thorium metal button, prepared by arc melting the sponge, gave a hardness of 90 VPN, and was analysed as 0-847, N-20, C-719, Mg-100, Fe-49, and Ni-50 (expressed in parts per million parts of thorium). The button has been further purified by electron beam melting to improve its ductility (button hardness—60 VPN). (19 refs.)

106070 Preparation of (UPu)C, (UPu)N and (UPu) (CN) powders. C.Ganguly, P.R.Roy (Radio Metall. Div., Bhabha Atomic Res. Centre, Bombay, India), A.K.Seal.
Trans. Indian Inst. Met., vol.35, no.2, p.148-61 (April 1982). [received: Aug. 1983]
The principal methods developed so far for the preparation of (UPu)C, (UPu)N and (UPu) (CN) powders on a laboratory scale are: (a) direct synthesis from elements, (b) carburisation and nitridation of fine uranium-plutonium alloy powder and (c) carbothermic reduction of uranium-plutonium oxides. The carbothermic reduction process has the greatest potential for commercial utilisation because of economic incentive and inherent safety. The development work carried out in different laboratories has been confined to uranium rich compositions ($Pu/U=0.18$ to 0.43) only. Results of the laboratory scale preparation of plutonium rich ($Pu/U=2.33$) (UPu)C, (UPu)N and (UPu)(CN) by the carbothermic reduction of the oxide are reported. (29 refs.)

106071 Pyrohydrolysis reactions of UF_4 and UO_2F_2. Effect of oxygen on reactions. M.Iwasaki, N.Ishikawa (Tokai Res. Establ., JAERI, Tokai, Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.5, p.400-4 (May 1983).
This study was made for clarification of the pyrohydrolysis behaviours of UF_4 and UO_2F_2. The progress of the reaction was measured by titrating the amount of produced hydrogen fluoride. When nitrogen was used as carrier gas of water, the pyrohydrolysis of UF_4 proceeded at the temperatures of 350~400°C, and UO_{2+x} ($x \lesssim 0.3$) was formed; the value of x decreased with the decrease of oxygen dissolved in the water. In the case of oxygen carrier gas, the pyrohydrolysis of UF_4 formed U_3O_8-UO_2F_2 mixture as the reaction product in the above temperature region and the reaction was markedly retarded in the course because of lower rate in the pyrohydrolysis of UO_2F_2. The pyrohydrolysis of UO_2F_2 proceeded at a little higher temperature of 450~500°C in both cases of nitrogen and oxygen carrier gas and α-UO_3 was formed. (14 refs.)

106072 Theoretical analysis of ternary UF_6 gas isotope separation by centrifuge. T.Kai (Tokai Works, Power Reactor & Nuclear Fuel Dev. Corp., Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.6, p.491-502 (June 1983).
The author presents a theoretical analysis of the isotope separation in a centrifuge for the ternary gas mixture which includes ^{236}U besides ^{235}U and ^{238}U. The expressions for the diffusion velocities are used to derive diffusion equations in terms of the mole concentration and of the mass average velocity. The concentration distributions of the ternary UF_6 gas isotopes are calculated by numerically integrating the above diffusion equations with the aid of a flow field for an appropriate model centrifuge. A value function for two of any species in a multicomponent mixture is defined as a natural extension of the value function for a binary mixture. Furthermore, a total value function for the whole multicomponent mixture is defined as a linear combination of the obtained value function. The results of numerical calculations show that the total separative power for the ternary gas isotopes mixture derived from the total value function is an effective expression for the evaluation of centrifuge separation performance. (17 refs.)

106073 Evaluation of computational models for fission and spallation reactions used in accelerator breeding and transmutation analysis code. Y.Nakahara (JAERI, Tokai, Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.6, p.511-17 (June 1983).
Computational models for spallation and fission reactions used in an accelerator breeding and transmutation code have been evaluated by performing calculations for thin targets of Bi, Pb, Th and U in the energy range of 50~1000 MeV. Proton and neutron non-elastic and fission cross sections have been derived from the counts of real collisions and fission events in the targets. Several fission models in combination with a spallation model are compared with the experimental data due to Steiner et al. (1956) and Schimmerling et al. (1973). A good agreement has been obtained for a model with the level density parameters $a_n=A/10$ and a_f/a_n fitted to the data due to Il'inov et al. (1980). The mass dependence of the non-elastic cross sections has been calculated also with the use of the best fit model. A good agreement with the experimental data was obtained over a wide range of nuclear masses. (20 refs.)

106074 Separation of some radionuclides from fission product elements by adsorption on diethylene glycol succinate. M.B.Hafez, Abo El-Khair B.M. (Chem. Dept., United Arab Emirates Univ., Al Ain, Egypt).
J. Radioanal. Chem. (Switzerland), vol.78, no.1, p.25-8 (1983).
Separation of adsorbed radionuclides on diethylene glycol succinate (DGS) by diethylene-triaminepentaacetic acid (DTPA) was quantiatively performed. Adsorption between the radionuclides studied and DGS was attained at pH 5±0.5. Individual separations of ^{60}cobalt (II), ^{90}strontium (II), ^{144}cerium

(III), ^{233}uranium (VI) and ^{239}plutonium (IV) were done by 25 ml of 10^{-4} M of DTPA, as eluting agent, at different pH values. (5 refs.)

106075 Integrated testing of equipment for FBR fuel reprocessing. W.D.Burch (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Nucl. Eng. Int. (GB), vol.28, no.345, p.37-9 (Aug. 1983).
To support the development in the United States of equipment and systems for a proposed demonstration reprocessing plant for fast reactor fuel, the Integrated Equipment Test facility has been built at Oak Ridge National Laboratory for trials of prototype hardware systems. (no refs.)

106076 Developments in breeder reprocessing technology and design concepts—the remote operation and maintenance aspects. M.J.Feldman (Fuel Recycle Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.401-2
The conceptual design of a facility for breeder reactor reprocessing recently done at Oak Ridge National Laboratory included capabilities to process high-level waste, transuranium waste, low-level waste, and gaseous effluents. The solutions in remote control engineering that will satisfy a highly efficient, high-level waste processing facility, which does not rely on personnel exposure to resolve its maintenance and operational problems, will be similar to solutions that satisfy the same problems in reactor maintenance, fuel refabrication and reprocessing, fusion plant maintenance, decontamination and decommissioning, and an ever-present category called unplanned events. (5 refs.)

106077 Operational experience in remote handling during the reprocessing of PFR fuel elements. G.Bailey (Waste Management Section, Dounreay Nuclear Power Dev. Establ., Dounreay, Scotland).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.403-11
The reprocessing of PFR elements at DNE was achieved using new techniques of remote handling as well as standard manipulative procedures. This engineering balance was justified in the successful completion of two PFR reprocessing campaigns, where the personnel involved received low radiation doses. Development work is progressing along the lines of minimizing in-cell equipment, improved remote viewing, and the modular assembly and construction of equipment and cells. (3 refs.)

28.43 FISSION REACTOR OPERATION

106078 Automation with microcomputers.
Elektro-Anz. (Germany), vol.36, no.15-16, p.13-15 (Aug. 1983). In German.
The article looks at the way in which the microcomputers now available can be used to rationalize factory operations, optimize processes and enable manufacturing operations to be carried out at greater speed and with greater accuracy. Some of the examples briefly described include the rationalization of measuring processes, calibration systems and two systems for the monitoring and control of the power generation and feedwater supply of two nuclear reactors in Sweden. (no refs.) *R.S.*

106079 Simple method for evaluating mesh size effects in control rod worth analysis. K.Azekura, K.Kawashima, K.Inoue (Energy Res. Lab., Hitachi Ltd., Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.6, p.518-21 (June 1983).
A new method for evaluating mesh size effect on control rod worths using the first-order perturbation theory is presented. The method allows other effects such as diffusion coefficients to be evaluated at the same time, and hence computing and labour costs can be saved significantly. The authors apply the method to the typical fast reactor critical experiment ZPPR-9. (7 refs.)

106080 Mirage effect of non-linear transfer element (symmetric limiter) upon power spectral density function of statistical fluctuation. H.Fujita, H.Konno, K.Saito (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.6, p.521-2 (June 1983).
Nuclear reactor noise intrinsically features nonlinear properties, which are occasionally revealed in power spectral density profiles. In order to clarify the characteristics of the noise profiles, the authors take the symmetric limiter as an example of the nonlinear element and present a numerical investigation of the distortion effects. (4 refs.)

106081 Heat transfer in the supercritical region at low pressure and mass velocity. G.V.Tsiklauru, T.S.Dzhishkariani, M.E.Kipshidze (Inst. of High Temperatures, Acad. of Sci., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1187-92 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.709-15 (Nov. 1982). [received: Sept. 1983]
Results are presented from experiments on heat transfer in the supercritical region for pressures $p=0.05$-0.3 MPa and low mass velocities $\rho w=16.9$-168.9 kg/m^2.sec, i.e. for conditions characteristic of emergency and post-emergency regimes of operation of steam-generating equipment in nuclear power plants. (13 refs.)

106082 Post-accident monitoring at Arkansas One. M.Huff, J.Shea (Generation Engng. Dept., Arkansas Power & Light Co., Little Rock, AR, USA).
Nucl. Eng. Int. (GB), vol.28, no.343, p.29-32 (July 1983).
Arkansas Power and Light was one of the first utilities in the United States to install and operate the type of on-line post accident sampling system described here. A large investment has been made to ensure adequate post accident sampling, as well as improving normal sampling and reducing exposure to sampling system operators. The utility feels that the lessons learned are worth sharing with those contemplating similar modifications in the future. (no refs.)

106083 Large test rigs verify Clinch River control rod reliability. H.D.Michael, G.G.Smith (Westinghouse Electric Corp., Advanced Energy Systems Div., Madison, PA, USA).
Nucl. Eng. Int. (GB), vol.28, no.343, p.38-40 (July 1983).
Reliability testing programmes for the Clinch River FBR control rod systems have been carried out on two major facilities at Westinghouse's Waltz Mill site. One of the rigs contains three sodium loops and has been used for a complex matrix of shutdown tests. The other is principally for seismic testing. (no refs.)

106084 A theoretical analysis of the DC electromagnetic flow coupler. W.F.Hughes, C.C.Alexion (Westinghouse R&D Center, Pittsburgh, PA, USA).
Nucl. Eng. & Des. (Netherlands), vol.74, no.3, p.367-76 (1982).
A descriptive model and design procedure for the DC electromagnetic flow coupler is developed based on a quasione-dimensional analysis previously developed for the DC electromagnetic pump. It is shown that for a particular flow coupler geometry, the total efficiency and the pressure gradients through the pump and generator depend on two parameters—the Hartmann number and the ratio of the pump flow rate to generator flow rate. Thus, for a fixed Hartmann number the efficiency depends only on the flow ratio. However, for a fixed pressure rise through the pump it is shown that the efficiency depends only on the Hartmann number. Nomographs showing the operating characteristics and critical design points are presented. Example calculations for a full-size unit, suitable for use in a liquid-metal cooled fast breeder reactor are also discussed using the design nomographs. (11 refs.)

106085 Repairs to the coolant circuit of the Universities Research Reactor. H.Bridge, E.Humphreys (Univ. Res. Reactor, Risley, England).
Nucl. Energy (GB), vol.22, no.4, p.261-6 (Aug. 1983).
The Universities Research Reactor of the Universities of Liverpool and Manchester is one of the three low-power reactors financed in 1963 by the Science Research Council to provide research and training facilities in the nuclear sciences and related disciplines. During low-power operation on 29 March 1977, a leak detector on the drain pipe to the sump below the core gave a positive indication. The reactor was shut down and an inspection revealed water seeping from beneath the removable shielding in the south face. The authors describe the steps taken to locate the source of this seepage and details subsequent repairs to the primary coolant circuit. Apart from a few specialized tasks, the entire operation was carried out by members of site staff. The success of the health physics precautions enforced during the six-month period required to complete the repairs may be judged from the total beta/gamma dose of 7.33 man-rems received by the 21 workers involved. (2 refs.)

106086 Boiling heat transfer and nuclear power. K.Nishikawa.
Rep. Res. Inst. Ind. Sci. Kyushu Univ. (Japan), no.74, p.227-47 (1983). In Japanese.
The importance of boiling heat transfer in nuclear power production is stated and the relation among the information requirements of the nuclear reactor, thermodynamic data and boiling is clarified. In order to understand the boiling heat transfer in the field of nuclear power engineering by grasping the essence of boiling phenomena, the characteristics of three basic types of boiling (nucleate, film and transition) are illustrated. (38 refs.)

106087 Design, installation, and use of experimental facilities at the Texas A&M University Nuclear Science Center. G.Schlapper, D.E.Feltz, J.Head, J.Holland (Texas A&M Univ., College Station, TX, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.8-9 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The Nuclear Science Center (NSC) at Texas A&M University (TAMU) is currently pursuing an upgrade aimed at improving existing facilities and developing new and unique facilities for experimental use. The objective of this program is to increase reactor utilization at reasonable costs. The purpose of this paper is to outline this effort. Two existing facilities for neutron radiography and production of tailored energy gamma beams are described in detail and planning for another experimental effort in the area of analysis of nuclear pumped plasmas is discussed. (no refs.)

106088 Reinitiation of pulsing operations at the Texas A&M Nuclear Science Center. D.E.Feltz, R.D.Rogers (Texas A&M Univ., College Station, TX, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.9-11 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Pulsing operations of the Nuclear Science Center Reactor (NSCR) at Texas A&M University were terminated in September 1976 following the discovery of three damaged fuel elements during a routine inspection. A commitment was then made to the US Nuclear Regulatory Commission (NRC) to terminate pulsing of the NSCR until a thorough study of the damaged fuel had been completed. A report describing that study and discussing the possible mechanism of damage was issued in December 1981. Based on a recommendation in the report to establish a fuel temperature safety limit, the NRC issued a letter authorizing the reinitiation of pulsing the NSCR but limiting pulsing parameters 'to those in the current technical specifications or to a maximum calculated fuel temperature of 830°C'. (1 ref.)

106089 Thermal hydraulic studies for upgrading the Virginia Polytechnic Institute and State University Argonaut reactor from 100 to 500 kW. R.J.Florian, T.F.Parkinson, P.D.Holian, D.R.Krause, E.R.Ellis (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.11-12 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The Virginia Polytechnic Institute and State University (VPI&SU) nuclear reactor is an Argonaut UTR-10 reactor, which has been in operation since 1959. In 1966, it was upgraded from 10 to 100 kW(th). It is currently being upgraded to 500 kW(th). It will be the first Argonaut reactor in the USA to operate at a power level in excess of 100 kW(th). (2 refs.)

106090 EBR-II reactor transient qualification tests. F.S.Kirn (Argonne Nat. Lab., Idaho Falls, ID, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.15-17 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
During November 1982, EBR-II completed a series of transient tests to qualify the driver fuel and the reactor system for future transient test operation. Since 1965, EBR-II has served as a test bed for a large variety of LMFBR fuels and materials, operating under steady-state conditions, providing burnup levels in oxide and metal fuels up to 18 at.% and fluences on materials up to 20×10^{22} nvt. It is known that fuel performance is also related to rate of power change as well as the usual steady-state parameters of burnup, fuel density, cladding, etc. Therefore, the EBR-II Project began an investigation into extending the irradiation program into this area of transient testing, which would include not only the effect of rate of power changes to fuel

performance but also the capability of raising test elements to overpower conditions. A test matrix was established for the reactor, which would specifically qualify the reactor driver fuel as well as the mechanical components, secondary sodium system, and steam system for the extremes of the envisioned test program. This matrix would then be investigated under steady-state conditions and at two different power ramp rates of 0.7 and 4 MW/s over a power change from 40% power to full power. (no refs.)

106091 Signal validation for a boiling water reactor suppression pool. J.Fisher, A.Ray, R.Ornedo (Charles Stark Draper Lab., Cambridge, MA, USA), E.Kujawski, S.M.Divakaruni, P.Smith.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.50-2 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
A real-time signal validation program has been developed for monitoring a boiling water reactor (BWR) suppression pool and related sensors. The major objectives are to (a) improve the reliability of information that is needed to implement emergency operating procedures, (b) provide a reliable, cost-effective means for suppression pool temperature monitoring, and (c) validate data for an SPDS. The methodology can also be used to determine the additional sensors necessary to meet the aforementioned goals. The program has been tested with Oyster Creek plant simulation data. A variety of sensor and plant component faults were successfully identified during simulated steady-state and transient operations. (9 refs.)

106092 Pressurized water reactor chemistry/radiochemistry sampling programs. J.D.Maddox (Public Service Co. of New Mexico, Albuquerque, NM, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.53-4 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The establishment, monitoring, and maintenance of a pressurized water reactor (PWR) fluid chemistry sampling program is an important element of a successful PWR startup and operations plan. A viable program will contribute significantly to a smoother and contiguous plant startup. The dividends of a smoother and contiguous startup add up quickly at ~$1,000,000/day for a delayed startup schedule. This paper emphasizes the importance and difficulty of achieving and maintaining proper water purity and chemistry during plant startup through actual plant startup experiences. (no refs.)

106093 Pipe vibration testing. R.L.Humphreys (Sargent & Lundy Engrs., Chicago, IL, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.54-9 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
In 1980, when ANSI/ASME OM-3 (Requirements for Preoperational and Initial Startup Vibration Testing of Nuclear Power Plant Piping Systems) was being prepared, Sargent and Lundy (S&L) undertook a survey of programs that were being used in the industry. The purpose of this survey was to include the best features of these programs and the then proposed ANSI Standard in S&L's unique approach to qualifying piping for steady-state and transient flow-induced vibration. The analytical approach that was developed from this study was then tempered by the practical application of the program on power plant piping. (no refs.)

106094 Susquehanna one startup test program. R.G.Sheranko (Pennsylvania Power & Light Co., Berwick, PA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.59-60 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Susquehanna Unit One is the first domestic boiling water reactor (BWR) to complete a startup test program since the Three Mile Island accident. The Susquehanna startup test program was based on the General Electric startup test specifications augmented with other tests to comply with Regulatory Guides 1.68-Rev.2, 1.68.1-Rev.1, and 1.68.2-Rev.1. The majority of additional testing concerned the thermal growth and vibration testing of ASME Section III Nuclear Class 1, 2, 3 and ANSI B31.1 piping. (no refs.)

106095 Engineering support for startup and testing. J.E.Carter (Stone & Webster Engng. Corp., Cherry Hill, NJ, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.60-1 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Engineering support is essential for a timely and efficient initial startup and test program. This support must be established well in advance of the actual testing dates and must continue, with increased intensity, for the duration of the test program. This paper reviews engineering support issues for power plant test programs during the design and procurement, construction, and test and startup phases of a project. The technical matters and administrative methods addressed highlight the critical role that engineering plays in the startup effort and reflect, to a large extent, the approach taken on several Stone and Webster Engineering Corporation projects. (no refs.)

106096 Microcomputer based data acquisition and analysis applications for nuclear power plant startup. J.C.Zimmerman (Impell Corp., Bannockburn, IL, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.62-3 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The use of microcomputer-based data acquisition equipment during the conduct of preoperational and initial startup testing offers several benefits to the plant engineer. First, high-speed multiplexing techniques permit the acquisition of relatively large quantities of data in shorter time frames. Second, application-specific input cards permit data to be acquired from a variety of input sources. Third, 16-bit microprocessors programmed using high-level languages such as BASIC provide the formulation capability and numerical precision necessary to perform local engineering analysis. Last, formatted printing software and graphics packages provide flexible data representation as well as hard copy documentation of results. (1 ref.)

106097 Midland technical specifications equipment control system. F.Hubbard, E.Abbott, J.C.Lin (Pickard, Lowe & Garrick Inc., Washington, DC, USA), A.Puplis, S.Cherba.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.63-4 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The Midland technical specification equipment control system (MTSECS) consists of an integrated set of 'logic' models each for a given limiting condition of operation (LCO) in the Midland technical specifications. Each model contains a logical arrangement of components and sub-systems necessary to assure operability of the system associated with the LCO. The logical arrangement of the components within each model determines whether or not failure of or maintenance on that component will put the plant in the 'action statement' of the LCO. The action statement may require a plant shutdown within a fixed period of time or a verification of the operability of redundant systems. The logic model and component data base have been computerized for ease of LCO monitoring and to allow an operator to test the effect on LCOs of planned maintenance operations. (no refs.)

106098 Digital computer control of a nuclear reactor. J.Bernard, A.Ray, D.Lanning (MIT, Cambridge, MA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.64-6 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
This paper describes a digital algorithm that changes power on the 5-MW(th) MIT research reactor. The Massachusetts Institute of Technology and the Charles Stark Draper Laboratory have undertaken a program to demonstrate signal validation techniques for real-time fault diagnosis, information display, and sensor calibration in nuclear plants. (2 refs.)

106099 Design of an automatic control rod drive system for transient power testing at EBR-II. L.J.Christensen (Argonne Nat. Lab., Idaho Falls, ID, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.66-9 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
A computer-controlled automatic control rod drive system (ACRDS) was designed and operated in EBR-II during reactor runs 121 and 122. The ACRDS was operated in a 'checkout' mode during run 121 using a low worth control rod. During run 122 a high worth control rod was used to perform overpower transient tests as part of the LMFBR oxide fuels transient testing program. The testing program required an increase in power of 4 MW/s, a hold time of 12 min and a power decrease of 4 MW/s. During run 122, 13 power transients were performed. (2 refs.)

106100 Computer applications for reactor control and diagnosis. L.R.Monson, R.C.Stratton, G.H.Chisholm, R.W.Lindsay (Argonne Nat. Lab., Idaho Falls, ID, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.69-70 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
As a result of the Three Mile Island (TMI-II) accident, the nuclear industry has emphasized development of methodologies and systems that will enhance the safety of the nuclear power industry. The operator is the focal point of the control of a nuclear power system and as such, requires the input of reliable and complete information to make proper decisions related to plant operation and safety. Extensive effort is being employed throughout the technical community in the area of man-machine interaction (MMI) to assist the operator with this task. (no refs.)

106101 Innovations and observations from boiling water reactor plant startup and operation. W.C.Elhoff (Combustion Engng. Inc., Windsor, CT, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.84-5 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Discusses innovations and observations gleaned from a review of the General Electric Co. (GE) 22-year experience base in starting up over 40 boiling water reactor (BWR) plants and in subsequent operational support. (no refs.)

106102 Evaluation of primary feed-and-bleed cooling capability of pressurized water reactor systems. L.C.Pwu (GPU Nuclear Corp., Parsippany, NJ, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.85-6 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
A simple theoretical approach has been proposed to demonstrate the capability of a PWR system to undergo feed-and-bleed cooling. A sample run has shown that a typical PWR with high pressure injection (HPI) and a 0.02 ft^2 power-operated relief valve (PORV) can undergo stable feed-and-bleed cooling after loss of steam generators, provided the HPI is throttled as the pressurizer level exceeds 80%. It is applicable to other PWRs with different HPI and PORV design. Sensitivity studies, which vary the controlling bands for throttling the HPI and opening and closing the PORV, will determine the proper optimal guidance to achieve stable feed-and-bleed cooling. (3 refs.)

106103 A review of proposed instrumentation for measurement of inadequate core cooling in light water reactors. P.G.Bailey, M.Merilo (EPRI, Palo Alto, CA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.88-91 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The paper discusses many of the various concepts and systems that have been proposed for the determination of water level in PWRs. Three instrumentation systems offered by the PWR vendors are presented since they have already been or are about to be installed in commercial operating reactors. These systems are of particular interest to the nuclear utilities, as the NRC has required that each utility (on a plant-by-plant basis) commit to a choice of a system for installation in each PWR to satisfy the NUREG-0737 requirements by the first refueling outage in 1983. (8 refs.)

106104 Input to output—a closer look at plant process measurement systems. G.L.Pannell (Technol. for Energy Corp., Knoxville, TN, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.100-2 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
One of the fundamental areas of concern in the operation of nuclear plant systems is the frequent use of implied, rather than actual, systems status. The use of indirect process measurements as feedback for system control often leads to judgments based on implied system conditions. In the same vein, the calibration of measurement systems experiencing a wide variance in both process and environmental conditions in the design of instrumentation is an issue requiring further scrutiny. The author discusses the following subjects: indirect measurements; in-containment measurement problems; advanced sensor design, and advanced systems using computer-based data reduction and display. (no refs.)

106105 Integration of the safety parameter display system in control room design. L.R.Peterson (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.102-3 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The need for a compact concise display of plant variables important to diagnosis of the safety status of a nuclear power plant was identified in early 1979 after the Three Mile Island, unit 2 accident. The US Nuclear Regulatory Commission (NRC) did not issue a requirement to install a safety parameter display system (SPDS) in the control room until December 1982 with the publication of Supplement 1 to NUREG-0737. The benefits to be derived from the SPDS will be determined by the management of each nuclear power plant. Management and designers have wide latitude to choose the form of the SPDS and the information to be displayed on it. The NRC

defined the function of the SPDS. The NRC did not determine prescriptive or proscriptive system design requirements. (no refs.)

106106 Use of a heat transfer coefficient for describing the radiative exchange between water vapour and the bounding walls. W.Eifler, I.M.Shepherd.
Report EUR 8344 EN, Comm. European Communities, Luxembourg (1983), 47 pp.
During the 'severe-fuel-damage' experiments of the SUPER SARA test program radiation heat transfer will play an important part. For the analysis of these experiments it should be modelled therefore in a particularly appropriate manner. Based on the same engineering type principles which are used in the radiation model of the TRAC code version for boiling water reactors, a new model has been developed. This model is less computer time consuming than the TRAC model and particularly appropriate for the use in the subchannel-type bundle computer code which is planned to be developed for the analysis of the 'severe-fuel-damage' experiments. (8 refs.)

106107 Study of dilute reagent decontamination for application in boiling water reactors. A.B.Johnson,Jr., B.Griggs, R.L.Dillon, F.Kustas, R.Peters.
Report EPRI-NP-2960, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 192 pp.
Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.
This report documents an experimental program to investigate the application of the dilute chemical decontamination (DCD) method to BWR coolant systems. Several decontamination parameters were investigated in the once-through test facility, including reagent composition, temperature, concentration, pH, and oxidation-reduction characteristics. The results of this study are related to results from other laboratories and to engineering considerations for a DCD of a BWR.

106108 Thermal mixing in a rectangular geometry model of a cold leg with high-pressure injection and a downcomer. A.Hashemi, J.Goodman.
Report EPRI-NP-2924, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 250 pp.
Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.
A series of tests to investigate fluid and thermal mixing in a transparent model of a PWR cold leg, with high-pressure injection and a downcomer, is described. Test conditions approximate the mixing phenomena in a prototypical reactor geometry, and the results include both transient temperature data and video movies of the cold leg mixing phenomena.

106109 Investigation of phosphate-sludge interactions. W.M.Connor, A.J.Panson.
Report EPRI-NP-2963, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 102 pp.
Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.
This report documents an investigation of the interactions of sodium phosphate with artificial steam generator sludge or sludge constituents. Tests were conducted at several temperatures in order to determine the effect of temperature on the initiation of these interactions, and the results are presented.

106110 Role of electrochemistry in causes and measurement of corrosion in PWR steam generators.
Report EPRI-NP-2962, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 88 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
The principles of electrochemistry are applied to the corrosion and stress corrosion of the engineering alloys used in PWR steam generators.

106111 Fatigue performance of Ni-Cr-Fe alloy 600 under typical PWR steam generator conditions. R.J.Jacko.
Report EPRI-NP-2957, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 402 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
The fatigue performance of Alloy 600 tubing in various high-temperature environments representative of reference and faulted PWR steam generator conditions is investigated. Details are given of the test matrix, which comprised strain-controlled low-cycle fatigue, load-controlled high-cycle fatigue, and resonant ultrasonic fatigue tests. The test environments and temperature range are described, the influence of a steady-state mean stress is analyzed, and the fatigue test results are presented.

106112 Evaluation of statistical reliability measures for a program for the limitation of power density in a reactor vessel. M.Kersken, B.Krzykacz (Gesellschaft fur Reaktorsicherheit mbH, Garching, Germany).
Software for Computer Control 1982. Proceedings of the Third IFAC/IFIP Symposium, Madrid, Spain, 5-8 Oct. 1982 (Oxford, England: Pergamon 1983), p.399-402
Errors within an assembler program for limiting the local power density in a reactor vessel are to be identified and corrected during two test phases. According to the special features for error detection of the testing facilities, the errors are classified, and an appropriate software reliability model is applied to each error class. These models allow predictions of certain reliability parameters from the observation of the test. Depending on the model employed these parameters can be e.g. the number of remaining errors, the probability for the occurrence of an error within a given time interval, the meantime between successive errors. 28.44 FISSION REACTOR PROTECTION SYSTEMS, SAFETY AND ACCIDENTS

106113 Quantification of the contribution of light water reactor core melt frequency of loss of offsite power. M.G.K.Evans, G.W.Parry (NUS Corp., Gaithersburg, MD, USA).
Reliab. Eng. (GB), vol.6, no.1, p.43-5 (1983).
In any risk study of light water reactors the loss of offsite power and subsequent performance of the diesel generators in support of the emergency core cooling systems is an important part of the transient analysis. This paper shows how the event tree for loss of offsite power can be developed by partitioning the mechanical and electrical failures, in such a way as to simplify sequence quantification and allow the modelling of recovery of AC power. (61 refs.)

106114 Mechanics of aerosols in nuclear reactor safety: a review. S.K.Loyalka (Nuclear Engng. Program, Univ. of Missouri, Columbia, MO, USA).
Prog. Nucl. Energy (GB), vol.12, no.1, p.1-56 (1983).
Although the estimated public risks from the nuclear reactors are not high, a significant fraction of these arises from the accident sequences that lead to severe core damage. Calculation of release fractions of the core radioactive inventories for such accidents requires an understanding of the evolution of aerosols in primary coolant systems and reactor containment. There have been considerable advances in aerosol mechanics as applied to the safety of nuclear reactors. The state-of-the-art in the mechanics of a single aerosol particle is first reviewed and then available work on coagulation of two aerosol particles is discussed. Progress in kinetic theory descriptions and experimental works is described and directions of future work are noted. Next the general dynamic equation for the aerosol distribution is considered, and several forms of this for conditions of interest are noted. Methods of solution that are discussed include analytical techniques, similarity transforms, moments methods and numerical techniques. Computer programs that have been developed in the past few years are also discussed, and their capabilities and limitations are noted. (60 refs.)

106115 Thermal shock in nuclear reactors. A.M.Clayton (Structural Integrity Dept., UKAEA, Warrington, England).
Prog. Nucl. Energy (GB), vol.12, no.1, p.57-83 (1983).
Most types of liquid cooled reactors undergo rapid changes in coolant temperature during abnormal operating conditions, which cause components adjacent to the coolant to undergo rapid surface temperature changes. The differential expansion between surface and bulk material caused by repeated thermal shocks can induce fatigue or cyclic creep damage. In thick walled components individual thermal shocks may cause rapid fracture from pre-existing defects. The paper reviews the reported experimental and analytical work defining the temperature, stress and resultant damage in reactor structural components subject to thermal shock. (61 refs.)

106116 Melting and cladding motion in a cylindrical vertical channel with a gaseous counterflow. J.Galan, R.Brun, M.Fortunato, J.Papin (CEA-Dept. de Surete Nucleaire du Centre d'Etudes Nucleaires de Cadarache, St. Paul, Lez Durance, France).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1453-61 (Oct. 1983). In French.
A physical model describing the melting, motion and relocation of the cladding after an accidental loss of sodium flow in a fast-reactor subassembly is presented. Fuel heating is also calculated. This model is based on a one-dimensional approximation of the Navier-Stokes equations governing sodium vapour and cladding flows. It takes into account transfer of mass, momentum and energy between phases. The hypotheses and the general equations of the model are indicated. The latter are solved by an explicit numerical method. A sequential analysis of results obtained in a concrete case along with a comparison with available experimental results are also considered. The comparison of calculated and experimental results leads to the conclusion that the major events are well described. (11 refs.)

106117 Prediction of critical heat flux in flow boiling at low qualities. J.Weisman, B.S.Pei (Dept. of Chem. & Nuclear Engng., Univ. of Cincinnati, Cincinnati, OH, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1463-77 (Oct. 1983).
A theoretically based prediction of CHF has been developed for the high velocity flow in tubes. Turbulent interchange between the bubbly layer and core regions is taken as the limiting mechanism. Good agreement was obtained between predictions and experimental data for water flowing in uniformly and nonuniformly heated tubes. The predictive procedure developed for water was found to yield results in agreement with experiment for each of the four other fluids examined. (65 refs.)

106118 Instruments and safety: surveying cause and effect. A.Krigman.
InTech (USA), vol.30, no.2, p.25-9 (Feb. 1983).
Instruments can cause as well as solve safety problems. As technology becomes more sophisticated, the challenges facing instrumentation specialists grow correspondingly more complex—to select, install, operate, and maintain equipment in a safe manner and to develop systems with higher levels of protection against injury or damage. Instrumentation specialists in nuclear

plants have met particularly stringent demands, and the approaches developed can serve as models for the monitoring and control system safety needs in other industries. (38 refs.)

106119 Nuclear qualification of instrumentation: benefits to the processing industries. R.D.Adams, C.C.Comins (Foxboro Co., Foxboro, MA, USA).
InTech (USA), vol.30, no.2, p.31-3 (Feb. 1983).
Instrumentation must be specially qualified for use in nuclear power generating stations. Efforts to meet the requirements of these critical applications have yielded improvements that benefit users in other industries as well. These include ability to operate under more severe conditions than ordinarily expected as well as increased confidence in reliability specifications. (no refs.)

106120 Effects of crud diameter on shutdown dose rate of recirculation pipes in boiling water reactors. S.Uchida, Y.Asakura, M.Kitamura (Energy Res. Lab., Hitachi Ltd., Hitachi, Japan), K.Ohsumi, K.Yonezawa, Y.Matsushima.
J. Nucl. Sci. & Technol. (Japan), vol.20, no.5, p.414-21 (May 1983).
The effects of crud diameter on radioactive corrosion product buildup in the primary cooling pipes of boiling water reactors were evaluated and the following conclusions were obtained: (1) the crud diameter affected the radioactivity buildup through two processes, i.e. deposition of crud on the fuel surfaces and adsorption of ionic cobalt on the fuel deposited crud. The contribution of the adsorption process to the radioactivity buildup for the plant where the average crud diameter was in the range of $1\sim10$ μm was as large as that of the deposition process. (2) As the result of numerical calculations by a radioactive corrosion product transport model, it was demonstrated that the shutdown dose rate was reduced by the suppression of crud concentration in the primary coolant when the crud diameter remained constant, and it was reduced by the increase of the average crud diameter when the crud concentration remained constant. (13 refs.)

106121 Measurement of leakage flow induced vibrations of cylinders. T.Nakao (Energy Res. Lab., Hitachi Ltd., Hitachi, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.5, p.433-5 (May 1983).
Some power plant components possess a slip-fit joint, which meets design requirement for allowing component removal and/or relative thermal expansion of structures. However, they complicate designing to avoid flow-induced vibrations since evaluation methods for the effect of leakage flow in an annular gap due to vibrations are difficult. Previous studies have been concerned with fluid forces and associated effective mass and damping provided by fluids in finite length annular gaps. The author presents basic data on the vibrational amplitudes of a cylinder in the presence of a leakage flow past the joint. (1 ref.)

106122 Water accumulation phenomena in upper plenum during reflood phase of PWR-LOCA by using CCTF data. T.Iguchi, Y.Murao (JAERI, Tokai, Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.6, p.453-66 (June 1983).
The water accumulation phenomena in the upper plenum of a PWR was investigated by using the data of the cylindrical core test facility (CCTF) test. When the liquid inventory in the upper plenum is small, the liquid carry over rate from the upper plenum was governed by the liquid inlet flow rate. After some amount of the water was accumulated in the upper plenum, the liquid carry over rate was governed by the steam up-flow rate and the liquid inventory in the upper plenum. The liquid carry over rate was higher with the higher steam up-flow rate and the larger liquid inventory. This trend on the liquid carry over rate was also observed in small scale model test. Based on the CCTF data, the empirical correlation on the liquid carry over rate was obtained. (8 refs.)

106123 Simulation test on interactions of Zircaloy claddings deforming in fuel assembly under LOCA conditions. M.Suzuki (Div. of Nuclear Safety Res., Tokai Establ., JAERI, Tokai, Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.6, p.475-90 (June 1983).
In a hypothetical LOCA of LWR, it is assumed that Zircaloy claddings of fuel assemblies undergo ballooning and cause thermal and mechanical interactions among themselves. To investigate the phenomena, burst tests were conducted with a single rod fuel simulator placed in the center of eight nonpressurized external heater pipes. It was found that the deformation and rupture behavior of ballooning cladding which made contact with the pipes depends on the following conditions: (1) temperature difference between cladding and heater pipes; higher temperature in the cladding than in the pipes produces an extended deformation and contact area, (2) internal pressure of cladding, and (3) temperature level at which ballooning takes place. It was observed and analyzed that cladding hoop tensile stress is largest at the inflection points generated in the contact surface of the expanding cladding. (19 refs.)

106124 Development of nuclear reactor accident diagnostic system based on knowledge engineering technique. J.Okada, M.Yokobayashi, F.Mizoguchi (Atomic Energy Society of Japan, Tokyo, Japan).
J. At. Energy Soc. Jpn. (Japan), vol.25, no.6, p.469-79 (June 1983). In Japanese.
For accident diagnosis in the nuclear reactor system from a global piont of view, the cause consequence tree (CCT) method has been mainly adopted as an effective technique. However this method is ineffective with insufficient or inconsistent accident information. To resolve this problem, the authors adopted the knowledge engineering method which had been recently developed in artificial intelligence research. They have developed a pilot system based on this method. This system is composed of two parts, the inference engine of EXPERT type and the diagnostic knowledge base which contains 211 production rules. This system allows stochastic diagnosis, display of diagnostic reasons, interactive consultation, and ease of frequent modifications and alternations of the diagnostic tree diagram. The authors have applied this system to various accident cases and examined the diagnosis, resolvability and usability. (23 refs.)

106125 Starting on a new phase at Loft. G.D.McPherson (US Dept. of Energy, Office of Nuclear Energy, Washington, DC, USA).
Nucl. Eng. Int. (GB), vol.28, no.343, p.32-6 (July 1983).
The objectives of the new OECD Nuclear Energy Agency programme at LOFT extend beyond NRC's previous focus on US safety issues. They include operating procedures and the design of commercial PWRs as well as their safety systems. It also expands on NRC's focus on principally thermal-hydraulic phenomena to include the release and transport of fission products. (no refs.)

106126 Analysing thermal hydraulics with the Bethsy loop. J.Brisbois (CEA, Inst. of Nuclear Protection & Safety, CEN, Fontenay aux Roses, France), M.Courtaud, J.C.Megnin, H.Sureau.
Nucl. Eng. Int. (GB), vol.28, no.343, p.36-8 (July 1983).
The Bethsy test loop will be commissioned at the nuclear research centre at Grenoble in France in 1986. Bethsy is specifically designed to create two-phase flow in the primary circuit, a situation where present knowledge is far from perfect. (no refs.)

106127 Criteria for determining the duration of containment integrated leakage rate tests. C.W.Rowley (Quadrex Corp., Campbell, CA, USA), T.M.Law, T.E.Renton.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.31-3 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
An integrated leakage rate test (ILTR) is typically on the outage critical path for a nuclear power plant. The objective of limiting the duration of ILRTs is to improve plane economics by reducing the critical path outage time, while maintaining an acceptable and technically accurate approach. It was the purpose of this project to clearly define and validate a set of technical test duration acceptance criteria indicating when an ILRT may be terminated, and to support the use of such criteria by the nuclear power industry at large. (2 refs.)

106128 The issue of CILRT duration. J.R.Dougan (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.33-4 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Containment integrated leakage rate tests (CILRTs) represent large investments of time and money on the part of the utilities operating nuclear power plants. These tests are conducted to ensure that an adequate degree of protection is being maintained by the containment against the release of radioactive products should an accident occur. Because these tests require the unit to be shut down they are normally conducted during refueling outages. Theoretically, a CILRT would not necessarily be a controlling event in returning the unit to power but, in practice, these tests often take quite a lot of time to complete. Thus the CILRT often is a controlling event in returning a unit to power and therefore should take no longer than necessary to establish the leakage rate of the containment. (7 refs.)

106129 Short duration PCILRT at Quad Cities using BN-TOP-1, rev.1. E.Mendenhall, J.Schnitzmeyer, F.Kaeppel (Commonwealth Edison Co., Chicago, IL, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.34-7 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
A test duration of <24 h has been allowed by the US Nuclear Regulatory Commission (NRC) provided the general test method used is that given in the Bechtel Corporation topical report BN-TOP-1, Rev.1, dated November 1, 1972. The statistical method used in BN-TOP-1 to analyze the collected data is different from the method previously used at Quad Cities; namely, the method presented in ANSI/ANS 56.8-1981. Therefore, simultaneous analysis was performed using both methods. If the measured leak rate phase of the test had been extended beyond 12 h, test procedures and the NRC test inspector would have permitted a full 24-h test using the ANSI/ANS method of statistical analysis. (no refs.)

106130 Containment failure experience-implications for testing. M.Weinstein (American Nuclear Insurers, Farmington, CT, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.37 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Containment integrity failure experience has been examined to determine how such failures were identified, the primary cause of failure, and implications for testing. All significant failures (i.e. $>L_a$) through 1982 have been considered. The majority of failures have been caused by large valves leaking in series. These were identified during local leakage rate tests (LLRTs). Some failures have also been identified during integrated leak rate tests (ILRTs). These failures also predominantly involve penetration paths. Increased emphasis on local leak rate testing is warranted and the effect on overall reliability of reduced durations during containment testing would be minimal. (no refs.)

106131 Evaluation of short duration integrated leakage rate test criteria. R.E.Blum, L.R.Young (Bechtel Nat. Inc., San Francisco, CA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.37 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Two methods have recently been proposed to determine when a short duration integrated leakage rate test (ILRT), per ANSI/ANS 56.8, should be terminated. The first method presents an extrapolation formula to determine if the calculated leakage rate will remain within a ±25% maximum allowable leakage rate (L_a) window during the next four hours. The second method formulates a convergence criteria on the calculated leakage rate and 95% upper confidence limit (UCL). Both of the methods base the decision as to whether or not to end the test on the last few hours of data. (4 refs.)

106132 NRC program for emergency preparedness upgrade at research and test reactors. F.G.Pagano (US Nuclear Regulatory Comm., Washington, DC, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.41 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
In August 1980, the US Nuclear Regulatory Commission (NRC) upgraded its emergency planning regulations to assure that adequate protective measures can and will be taken in the event of a radiological emergency to protect public health and safety. To discharge its statutory responsibilities effectively, the Commission must know that proper means and procedures will be in place to assess the course of an accident and its potential severity. Among other things, the revised regulations at 10CFR50.54(q) require licensees authorized to possess and/or operate a research reactor or a fuel facility to follow and maintain in effect emergency plans that meet the requirements in Appendix E to 10CFR50. The Commission recognized that the potential radiological hazards to the public associated with the operation of research and test reactors involve considerations different than those associated with power reactors. Consequently, the degree of compliance with the requirements of Appendix E for research and test reactors will be determined on a case-by-case basis. (no refs.)

106133 The review and evaluation of emergency preparedness at research and test reactors. G.Bates (US Nuclear Regulatory Comm., Washington, DC, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.41-2 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The upgraded emergency planning regulations require that licensees authorized to possess and/or operate a research or test reactor follow and maintain in effect emergency plans that meet the requirements of Appendix E to 10CFR50. Further, these licensees were required to submit upgraded emergency plans to the NRC for approval as a condition of the license. These plans are currently undergoing NRC staff review against the requirements of Appendix E. In addition, the staff review extends to ascertaining the degree of conformance with the guidance criteria set forth in Revision 1 to Regulat-

ory Guide 2.6, and ANSI/ANS-15.16-1982, 'Emergency Planning for Research and Test Reactors'. The purpose of extending the review and evaluation to include conformance with the guidance criteria is because licensees were requested by generic letter, dated June 16, 1982, to use these documents to meet the requirements of the amended emergency planning regulations and to institute a standard means of assuring that uniform evaluations and reviews are made of each plan. (no refs.)

106134 Establishing an effective relationship between the nonpower reactor licensee and regulator. J.D.Randall (Texas A&M Univ., College Station, TX, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.42-3 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Recent disclosures at the US Environmental Protection Administration (EPA) clearly illustrate the importance of the proper relationship between regulator and licensee. The situation there showed how an improper balance could directly and significantly impact the health and welfare of the general public. The major difficulty in establishing a harmonious and productive working relationship between the US Nuclear Regulatory Commission (NRC) and managers of nonpower reactor facilities is the potential for creating the appearance of collusion between the parties. However, if a proper relationship is not achieved, the public will eventually pay the price. (no refs.)

106135 SEP operating history review of the Millstone Unit 1 nuclear power plant. G.T.Mays (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), K.H.Harrington, M.D.Muhlheim.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.44-5 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The Systematic Evaluation Program Branch of the US Nuclear Regulatory Commission (NRC) is conducting the Systematic Evaluation Program (SEP) for the purpose of determining the safety margins of the design and operation of ten of the older operating commercial nuclear power plants in the United States. These ten plants are being reevaluated in terms of present NRC licensing requirements and regulations. The SEP evaluates specific safety topics based on an integrated review of the ability of a plant to respond to certain design basis events including normal operation, transients, and postulated accidents. (1 ref.)

106136 Sensor response time measurement—seven years later. J.D.Trotter (NUS Corp., Gaithersburg, MD, USA), F.R.Feiner.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.45-6 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
In 1975, a parameter called 'reactor trip system response time' was defined in the technical specifications for D.C. Cook Unit 1. Furthermore, periodic measurement of this parameter became a requirement for the operators of D.C. Cook and subsequent plants licensed with 'standard' technical specifications. In the subsequent seven years a great deal of effort has gone into meeting this requirement. It is the purpose of this paper to question the basis of the requirement. In other words: 'Was there ever a problem?' First, a discussion of the history of this measurement and its attendent regulations will be given. Next, a summary of current test results and the authors' interpretation of those results will be shown. Finally, a proposal will be made to stop certain parts of time-response testing as currently practiced. (no refs.)

106137 Davis-Besse safety/power-operated relief valve test and modification program per NUREG-0737. G.O'Connor (Teledyne Engng. Services, Waltham, MA, USA), M.Foust.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.46 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
In March 1979, Three Mile Island Unit 2 (TMI-2) Nuclear Station experienced a loss of feedwater transient that led to a series of events that created a partial loss-of-coolant-accident (LOCA) with core damage. As a result, NUREG-0737 was issued outlining actions to be taken by each utility. This presentation addresses the Toledo Edison/Teledyne Engineering Services approach for the Davis-Besse Nuclear Station to item II.D.1 of NUREG-0737, which is testing of safety- and power-operated relief valves and a determination on the effect of valve operation on the valves and discharge piping. (no refs.)

106138 Automated security functions. D.L.Davenport (Gulf States Utilities, St. Francisville, LA, USA), P.M.Buck.
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.46-7 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
River Bend Station is a 934-MW boiling water reactor (BWR6), being constructed by Gulf States Utilities near St. Francisville, Louisiana. The scheduled commercial operation date for this unit is in the fourth quarter of 1985. The Plant Security Group has been working with the Plant Technical Staff to define and implement automated security functions that will augment the capabilities of the Station Security System. This work has led to the implementation of computer programs that address the following functional requirements: (a) station key control, (b) station door lock control, (c) vehicle decal control, and (d) employee badge control. A brief overview of each of these functional capabilities is outlined. (no refs.)

106139 Vermont Yankee gamma-TIP versus neutron-TIP experience. R.A.Woehlke (Yankee Atomic Electric Co., Framingham, MA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.47-50 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
During Cycle 8, Vermont Yankee installed Gamma-TIPs. Comparisons to the preceding Neutron-TIP data indicate that Gamma-TIPs have improved core-wide accuracy about 2% and margin to limits 6 to 8%. (6 refs.)

106140 Emergency plan development and training for the Ohio State University Research reactor. J.W.Talnagi,Jr., R.D.Myser (Ohio State Univ., Columbus, OH, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.77 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
An emergency plan has been developed for the Ohio State University research reactor (OSURR), a pool-type research reactor utilizing fully enriched, flat-plate MTR-type fuel, licensed to operate at a maximum steady-state thermal power of 10 kW. The emergency plan was prepared with guidance from ANSI/ANS-15.16, and was submitted to the US Nuclear Regulatory Commission (NRC) in November 1982. Approximately two person-months of total effort was applied to plan development, at a total cost of ~\$4000. Plan highlights include discussion of site security in the event of an emergency, emergency organization, emergency classification, and emergency plan training. The OSURR credible emergency classes include: (a) nonnuclear, nonreactor safety event, and (b) notification of unusual event. (no refs.)

106141 Summary of Fast Flux Test Facility emergency planning. W.C.Moffitt, D.J.Newland (Westinghouse Hanford Co., Richland, WA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.77-8 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The emergency planning structure and experience at the Fast Flux Test Facility (FFTF) are described. The FFTF is a 400-MW(th) sodium-cooled, three-loop, fast test reactor operated by Westinghouse Hanford Company (WHC) for the US Department of Energy (DOE) as part of the Hanford Engineering Development Laboratory (HEDL) facilities. (no refs.)

106142 Emergency plan exercises and appraisals—a nuclear regulatory commission perspective. W.L.Axelson (US Nuclear Regulatory Comm., Washington, DC, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.79-81 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
During the period from April 1981 to April 1982, the US Nuclear Regulatory Commission (NRC) conducted emergency preparedness implementation appraisals (EPIAs) at all operating power reactors and several near-term operating licences. Emergency preparedness exercises were also conducted during this period. The purpose of the paper is to summarize what the NRC has learned as a result of these appraisals and exercises, particularly in the NRC Region III area. Region III includes the power reactors located in Minnesota, Wisconsin, Iowa, Missouri, Illinois, Indiana, Michigan, and Ohio. (no refs.)

106143 The effects of Three Mile Island on nuclear plant operations. C.M.Wethy (Florida Power & Light Co., Juno Beach, FL, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.82 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Out of the unfortunate TMI incident aftermath some good and some bad things have had a large effect on operating nuclear plants. The good has been the increased operator training and procedures. The experience gained at TMI has proved the nuclear plants can sustain a serious accident and still not injure the public or utility employees. Many technical improvements have been made and are still being made. On the other side of the ledger is the large amount of dollars and manpower that could have been put to better use if a slower more justified program for increased safety had been pursued. The most unfortunate change was the change of the NRC from a technically oriented organization to one that is more politically and legally sensitive. (no refs.)

106144 The effects on operation of combustion engineering reactors caused by Three Mile Island. W.E.Burchill (Combustion Engng. Inc., Windsor, CT, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.83-4 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The accident at Three Mile Island (TMI) has significantly affected those aspects of reactor operation concerning prepared response to abnormal operation or emergencies and has produced little effect on normal mode 1 reactor power operation. Day-to-day influences on the plant operating staff are felt through changes that have occurred in control room staffing and plant technical specifications. Perhaps the most significant impact outside of mode 1 operation is the necessity to rely on natural circulation cooling or to reestablish forced circulation by the reactor coolant pumps (RCPs) due to the requirement to trip the RCPs during significant depressurization of the reactor coolant system. Finally, the TMI accident has produced major improvements in the planning for operation during abnormal and emergency situations. Many of these improvements have been based on the concept of preserving plant safety functions. (6 refs.)

106145 Possible research program on a large scale nuclear pressure vessel. Report EUR 8221 EN, Comm. European Communities, Luxembourg (1983), 404 pp. Contract 667/683/684/685-76-12 SISPI/N/E/F/.
The nuclear pressure vessel structural integrity is actually one of the main items in the nuclear plants safety field. Large research efforts have been devoted to the study of various aspects of this problem. Nevertheless till now the related experimental activities have been performed only by means of various types of specimens or reduced scale models of components as well as of the pressure vessel itself. This kind of research work was carried on in the last years, and it is ongoing nowadays too, in all the countries interested in the development and use of nuclear reactors, especially of the LWR type. In 1976, the cancellation of several nuclear plants made available in the builders' workshops some scale 1:1 pressure vessels at various levels of assembling. The availability of those vessels for the development of an engaging international research activity suggested the Forward Studies Directorate of the CEC Joint Research Centre, Ispra, to promote the constitution and to support the work of an international study group aimed at investigated the feasibility of a 'possible research program on a scale 1:1 LWR pressure vessel'. The main purpose of the work of the study group is to provide the technical background to enable a decision to be made regarding the usefulness of an integrity and safety related research activity on a scale 1:1 or, as was stated later, on a large scale pressure vessel. If the outcome of the study should be in favour of such a research activity, its implementation should be a matter of collaboration between the interested organizations.

106146 Characterization of the pressure wave originating in the explosion of an extended heavy gas cloud: Critical analysis of the treatment of its propagation in air and interaction with obstacles. J.A.Essers.
Report EUR 8482 EN, Comm. European Communities, Luxembourg (1983), 142 pp. Contract ECI-794-2651-81-B.
The protection of nuclear power plants against external explosions of heavy gas clouds is a relevant topic of nuclear safety studies. The ultimate goal of such studies is to provide realistic inputs for the prediction of structure loadings and transient response. To obtain those inputs, relatively complex computer codes have been constructed to describe the propagation in air of strong perturbations due to unconfined gas cloud explosions. A detailed critical analysis of those codes is presented. In particular, the relative errors on wave speed, induced flow velocity, as well as on reflected wave speed and overpressure, respectively due to the use of a simplified non-linear isentropic approximation and of linear acoustic models, are estimated as functions of the overpressure of the incident pulse. The ability of the various models to accurately predict the time and distance required for sharp pressure front formation is discussed. Simple computer codes using implicit finite-difference discretisations are proposed to compare the results obtained with the various models for spherical wave propagation. Those codes are also useful to study the reflection of the waves on an outer spherical flexible wall and to investigate the effect of the elasticity and damping coefficients of the wall on the characteristics of the reflected pressure pulse. (49 refs.)

106147 Conversion of smectite to illite in hydrothermal systems: A literature review. R.M.Johnston.
Report AECL-7792, Atomic Energy Canada Ltd., Chalk River, Ont. (June 1983), 27 pp.
In natural diagenetic shale systems, smectite converts to illite and mixed-layer illite-smectite in less than a million years at temperatures between 75°C and 200°C. This has raised questions as to the stability of smectite-based bentonite buffers under nuclear waste disposal vault conditions. Experimental and geological evidence indicate that the reaction is dependent on the availability of K^+, and that the rate of reaction in K^+-poor systems (such as the disposal vault) may be much lower than that observed in shale. The presence of Na^+, Ca^{2+} and Mg^{2+} in the system slows the reaction and may halt it altogether at lower temperatures. Two different reaction mechanisms have been proposed; the evidence for, and implications of, each are discussed. (58 refs.)

106148 Kinetics of iodine and cesium reactions in the CANDU reactor primary heat transport system under accident conditions. D.J.Wren.
Report AECL-7781, Atomic Energy Canada Ltd., Chalk River, Ont. (April 1983), 52 pp.
Gas-phase reaction kinetics have been modelled for the release of cesium and iodine into steam and steam/hydrogen atmospheres. The conditions are those anticipated in a CANDU reactor fuel channel following some postulated loss-of-coolant accidents. A total of seventeen chemical species were used in the model, including all important cesium and iodine species. Reaction rate constants were taken from the literature, or calculated where possible, or estimated. The composition evolution of the system was calculated, following a burst release of cesium and iodine, as a function of total iodine and cesium concentrations, cesium/iodine release ratio, iodine release form (atomic I or CsI), fuel channel atmosphere, and radiolysis effects. In general, the calculation demonstrates that CsI and CsOH rapidly ($<10^{-2}$ s) become the most important species in the system for virtually all conditions. Atomic I is found to be significant only for very low release concentrations, or for Cs:I ratios less than unity. (46 refs.)

106149 Understanding the statistics of small risks. E.Siddall.
Report AECL-7541, Atomic Energy Canada Ltd., Chalk River, Ont. (Oct. 1983), 8 pp.
Monte Carlo analyses are used to show what inferences can and cannot be drawn when either a very small number of accidents result from a considerable exposure or when a very small number of people, down to a single individual, are exposed to small added risks. The distinction between relative and absolute uncertainty is illustrated. No new statistical principles are involved.

106150 Influence of base isolation on the seismic response of light secondary equipment. J.M.Kelly.
Report EPRI-NP-2919, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 70 pp.
Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.
A demonstration of the effectiveness of using three different configurations of base isolation systems designed to reduce the amplification of seismic loads transmitted to light secondary systems and equipment is described. Details are provided on the three forms of base isolation systems, which were subjected to shake table testing, and of the test findings. Recommendations for further research on a system combining the more successful base isolation principles are given.

106151 Testing of a natural rubber base isolation system by an explosively simulated earthquake. J.M.Kelly.
Report EPRI-NP-2917, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 58 pp.
Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.
Results of the SIMQUAKE II tests conducted to demonstrate a base isolation system for a reactor containment structure and to evaluate the performance of this system in protecting the structure from strong ground vibrating motions are presented. Details are provided of the 1/24-scale containment structure model; of the model's base isolation system, which incorporates multilayer natural rubber bearings and a novel fail-safe support system; and of the SIMQUAKE II tests, which utilized two distinct ground motions.

106152 Scale model tests of turbine missile containment by reinforced concrete. C.M.Romander, A.L.Florence.
Report EPRI-NP-2747, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 212 pp.
Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.
This report discusses 25 impact tests performed on 1/11-scale models of reinforced concrete walls in order to experimentally determine the threshold velocity at which postulated turbine missiles perforate reinforced concrete walls. In addition, an assessment of how well current design formulas can predict the velocity at which turbine missiles perforate concrete structures is presented.

28.50 FISSION REACTOR TYPES AND APPLICATIONS

106153 Benefiting from standardization in Russia and Western Europe. G.Greenhalgh.
Nucl. Eng. Int. (GB), vol.28, no.345, p.26-9 (Aug. 1983).
Like countries in the west, the CMEA countries have been reducing earlier estimates of future nuclear capacity, but this still leaves a substantial programme that is expected to result in around a 100 GWe of nuclear plant installed by 1990. A feature of the Russian approach is the high level of standardization, with components being supplied from a variety of sources in several countries. There is also strict control over the fuel cycle with all spent fuel being returned to Russia for reprocessing and storage. (no refs.)

106154 Operating experience of Manhattan College's critical reactor. G.Kane, J.Augustus (Manhattan Coll., Riverdale, NY, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.38-9 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Manhattan College initiated the first critical reactor of any kind in New York City on March 24, 1964. It still possesses the only licensed and operating critical reactor of any kind in New York City. This is a heterogeneous pool-type reactor, light-water moderated, and fueled with 92% enriched uranium. It is intended solely for teaching undergraduate students and training operators. As part of its use as an educational tool, students are given demonstrations of startup and operation procedures, and perform various experiments on the critical reactor facility, including approach to criticality, neutron flux distribution, reactor period and reactivity, void coefficient measurement, and gamma-ray spectrum in the vicinity of the reactor core. (no refs.)

106155 Penn State Breazeale reactor operation's management. R.E.Totenbier, S.S.Kim, H.Levine (Pennsylvania State Univ., University Park, PA, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.39-40 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Research reactor operation began at Penn State in 1955. For ten years, the original reactor core, which used MTR-type fuel, was operated at power levels up to 200 kW. In December 1965, a TRIGA Mark III reactor was installed with a 1000-kW maximum steady-state power level and a 2000-MW pulsing capability. Operations management of the Penn State Breazeale Reactor (PSBR) can be broken down into three major categories: scheduling, to ensure efficient use of both facilities and personnel; fuel management, to ensure that the reactor core is or can be made adequate to handle the schedule load; and accounting, to provide a means of justifying operating costs to the university and fuel efficiency to the US Department of Energy (DOE), which provides Penn State with a fuel replacement grant. (3 refs.)

106156 Eighteen years of operation with a sodium-cooled reactor: EBR-II. W.H.Perry, E.A.Clifton (Argonne Nat. Lab., Idaho Falls, ID, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.40-1 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
The Experimental Breeder Reactor II (EBR-II) is a sodium-cooled fast reactor with a design power of 62.5 MW(th) and net output at full power of 20 MW(e). The reactor is operated by Argonne National Laboratory for the US Department of Energy and is located at the Idaho National Engineering Laboratory in southeast Idaho. EBR-II (including the adjacent Fuel Cycle Facility) was completed in 1963, after five years of construction, at a cost of $32,500,000. EBR-II is now the longest operating breeder in the world and the only complete (with power plant) breeder operating in the United States. During its operating history, EBR-II has demonstrated that it is a versatile facility in performing varying programs. (5 refs.)

28.52 FUSION REACTORS

(for confinement, see 52.55)

106157 High resolution measurement of ^{3}He depth profile. H.Sekiguchi, H.Watanabe, T.Nishijima.
Bull. Electrotech. Lab. (Japan), vol.47, no.6, p.441-54 (1983). In Japanese.
In the investigation of the behaviours of He atoms in the first wall materials of controlled thermonuclear reactor depth profiles in metals implanted with ^{3}He have been measured. In order to improve the depth resolution and to obtain a large solid angle simultaneously in beam experiments, a magnetic deflector which deflects secondary electrons and forward scattered deuterons is put in front of the solid state detector. The depth resolutions of ^{3}He profiles in Ta and Nb metals implanted at energy of 500 keV are 135 Å and 166 Å respectively, and the solid angle is 5×10^{-4} Sr. A magnetic spectrograph is constructed combining a 90 degree deflecting magnet and a position sensitive solid state detector. It is estimated that the resolving power of ^{3}He depth profile in Ta is about 100 Å, and that the solid angle is about 5×10^{-4} Sr. (30 refs.)

106158 Inner frozen metal blanket concept for an ICF reactor. R.Tsuji, S.Ido (Inst. of Laser Engng., Osaka Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.987-91 (June 1983).
A new blanket concept for an inertial confinement fusion (ICF) reactor is proposed for protecting the structural materials from the impact of X-rays and plasma and controlling the plasma expansion. The inner blanket consists of several cm of frozen metal with holes for entry of the laser beams and for blow-off of the plasmas. The inner blanket is injected from the top of the reactor chamber at a speed of about 50 m/s. It is located near the fuel pellet (~10 cm from the pellet and ~5 m from the structural materials). When a microexplosion occurs, the inner frozen metal blanket is melted by the neutron heating and falls into the liquid metal pool, expanding and being guided by the magnetic field. The performance and neutronics calculations of the inner blanket are presented here using a simple model. (14 refs.)

106159 Zero-dimensional analysis of burn control with compression-decompression. M.Okamoto, M.Ohnishi (Inst. of Atomic Energy, Kyoto Univ., Kyoto, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.5, p.366-78 (May 1983).
A simple but realistic method of active feedback control of a self-ignited tokamak reactor by major radius compression-decompression is presented, in which the thermal fusion output power and the ion temperature are envisaged as the variables that could be adopted as object of control. Error inherent in the measuring system for the controlled variable is taken into account in the analysis. Numerical calculations based on a point reactor model are performed, which indicate that the proposed method of control is capable of completely suppressing thermal runaway without involving any significant change in the major radius or in the fusion output power. Matching the reactor output to changes in load is shown also to be possible from a numerical example. The thermal stability of an igniting plasma governed by this feedback control is analysed without prescribing any particular transport scaling. It is revealed that the control is achievable for a suitably chosen gain even with a response time lag longer than the thermal runaway time. Strong dependence of the stability on the scaling law is indicated. (15 refs.)

106160 Numerical analysis of hydrogen isotope separation characteristics in improved dual temperature exchange reaction system between water and hydrogen gas. Y.Asakura (Energy Res. Lab., Hitachi Ltd., Hitachi, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.5, p.422-32 (May 1983).
A dual temperature hydrogen isotopic exchange reaction system between water and hydrogen gas is numerically analysed. The system has two features; high efficiency of isotope exchange reaction and operation under atmospheric pressure. To achieve them, the low temperature section of the system is composed of water mist and hydrogen gas cocurrent reactor units. For the high temperature section, a multistage-type reactor, in which a bubble plate, superheater and catalyst bed are alternatively arranged, is applied. From a material balance between these reactors, enrichment and decontamination factors for the system are expressed as functions of seven parameters: unit number of the low temperature co-current reactor (X); stage number of the high temperature section (Y); flow ratio of tritium enriched water to decontaminated water (P/W), flow ratio of feed water to hydrogen gas (F/G); reaction temperatures of the low and high temperature sections (T_c, T_h); and bubble plate temperature (T_b). Numerical calculations show that enrichment factor depends remarkably on F/G and T_b as well as X and Y. In order to understand the separation characteristics visually, the McCabe-Thiele diagrams for the present system are drawn and compared with the results calculated. (18 refs.)

106161 Lithium isotope separation by displacement chromatography using cryptand resin. S.Fujine, K.Saito, K.Shiba (Div. of Nuclear Fuel Res., JAERI, Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.5, p.439-40 (May 1983). (11 refs.)

106162 Analysis of cleavage fracture potential of martensitic stainless steel fusion structures. I. Micromechanical models and material properties. G.R.Odette, G.E.Lucas (Dept. of Chem. & Nuclear Engng., Univ. of California, Santa Barbara, CA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.264-75 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The major disadvantage of martensitic stainless steels for structural applications in fusion reactors is currently considered to be their potential for low temperature brittle cleavage fractures. The authors review the current understanding of cleavage fracture in steels and the role of microstructure in dictating material resistance to this type of fracture. A parametric analysis of cleavage fracture in a surrogate steel, A533B, is made and the results are used in conjunction with general cleavage fracture theory to establish some potential guidelines for future research in developing the martensitic stainless steels. (44 refs.)

106163 Analysis of cleavage fracture potential of martensitic stainless steel fusion structures. II. Fracture analysis procedures for flawed fusion structures. G.R.Odette, G.E.Lucas (Dept. of Chem. & Nuclear Engng., Univ. of California, Santa Barbara, CA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.276-86 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
For pt.I see ibid., vol.117, p.264-75 (1983). The potential for brittle cleavage fracture is a major concern for martensitic stainless steels which are candidates for fusion reactor structural materials. The authors attempt to identify for flawed fusion structures the pertinent fracture resistance or failure parameters and the relationships between these parameters and the basic materials properties which govern cleavage fracture. Several procedures for relating test data to failure prediction, including Charpy-V-notch transition temperature referencing and two-parameter interpolation procedures, are considered; and results are discussed with respect to possible research paths for martensitic stainless steel alloy development. (29 refs.)

106164 The dependence of the high temperature mechanical properties of austenitic stainless steels on implanted helium. H.Schroeder, P.Batfalsky (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
J. Nucl. Mater. (Netherlands), vol.117, p.287-94 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
High temperature helium embrittlement effects on the creep properties of AISI 316 SS (solution annealed+aged) and DIN 1.4970 SS (solution annealed+cold worked+aged) have been investigated. The generation of helium due to (n, α) nuclear reactions in a fusion reactor environment has been simulated by homogeneous helium implantation at a cyclotron. The creep rupture tests with various applied tensile stresses have been carried out at 1023K (316 SS) and 1079K (1.4970 SS), respectively, with four differently treated sets of samples: (1) unimplanted controls; (2) after room temperature implantation of 100 appm He; (3) after implantation of 100 appm He at test temperature; (4) creep tested at high temperature during implantation ('in-beam') with implantation rates of 10-100 appm He/h. In contrast, to the ductile behaviour with transgranular failure of the unimplanted controls, all He-implanted samples showed brittle, intergranular early failure. The embrittlement effect was enhanced for the 'in-beam' tested samples. The difference between the differently treated sets of samples can be related to different bubble microstructures investigated by TEM. In addition, a comparison to reactor data for the DIN 1.4970 SS is presented. (12 refs.)

106165 The resistance of 9 Cr-1 MoVNb and 12 Cr-1 MoVW steels to helium embrittlement. R.L.Klueh, J.M.Vitek (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.295-302 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Small amounts of helium (15-40 at. ppm) are known to cause embrittlement in a large number of alloys when tensile tested at elevated temperatures. To determine the effect of helium on ferritic steels of interest for fusion reactor applications, tensile specimens of normalized-and-tempered 9 Cr-1 MoVNb with 0.1 and 2% Ni and 12 Cr-1 MoVW with 0.4, 1, and 2% Ni were irradiated in the High Flux Isotope Reactor (HFIR) at ~55°C. Helium up to ~42 at. ppm was produced by a two-step reaction of ^{58}Ni with thermal neutrons. No embrittlement was detected in tensile tests at 700°C. These results are contrasted with the more severe embrittlement reported in the literature for several other types of alloys containing 15-30 at. ppm He. (20 refs.)

106166 The development of small specimen mechanical test techniques. G.E.Lucas (Dept. of Chem. & Nuclear Engng., Univ. of California, Santa Barbara, CA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.327-39 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The current program plan for the development of materials for fusion reactors requires testing candidate materials in both fission reactors and high energy neutron sources. Because of the volume limitations of available facilities, both

current and near term, and because of the relatively large number of materials and test conditions that will need to be explored, it is essential that test techniques be developed to extract mechanical property information from small volume specimens. A variety of such test techniques are under development at the University of California, Santa Barbara. These include instrumented microhardness, bulge, shear punch, indentation creep and load relaxation and miniaturized fracture tests for obtaining strength, ductility, time-dependent flow, and fracture information on specimens as small as TEM discs. (34 refs.)

106167 Static and buckling analysis of a cryostat outer wall (Bell-Jar) for the whole magnetic system of the INTOR-NET fusion reactor. M.Biggio, J.Airola, F.Farfaletti-Casali, M.Turri (Comm. of the European Communities, Joint Res. Centre, Ispra, Italy).
Nucl. Eng. & Des. (Netherlands), vol.74, no.3, p.317-24 (1982).
In the framework of the studies performed for the Experimental Fusion Reactor INTOR/NET, the proposal was considered of enclosing the Torus and the whole magnetic system in a single large metallic containment under vacuum, constituting the outer boundary of the cryostat. Such a big containment (called the Bell-Jar) poses severe engineering problems of feasibility and stability. The conceptual design was analysed and developed in detail with extensive use of the finite element method. The studies enable one to identify a configuration which is able to sustain the applied loads in stable equilibrium conditions within the allowable stress limits. (3 refs.)

106168 Fatigue evaluation of the JT-60 vacuum vessel under the dynamic electromagnetic forces. H.Takatsu, M.Shimizu, M.Ohta (JAERI, Ibaraki, Japan), Y.Nakamura, K.Sakai, K.Uchino.
Nucl. Eng. & Des. (Netherlands), vol.74, no.3, p.325-37 (1982).
Fatigue evaluation of the JT-60 vacuum vessel was carried out under the dynamic electromagnetic forces. In the present method, fatigue strength of the vacuum vessel is evaluated not only during the transient response but during the free vibration following the transient response. Stress amplitudes during the transient response are counted using the range-pair count method faithful to the stress strain hysteresis loop. The fatigue damage during the transient response and the free vibration following the transient response is evaluated based on Miner's law. The fatigue evaluation results showed that the JT-60 vacuum vesel has the sufficient fatigue strength and the free vibration has much larger contribution to the fatigue damage than the transient response. (15 refs.)

106169 A conceptual design of light ion beam fusion reactor—UTLIF(1). H.Madarame, S.Iwata, S.Kondo, A.Suzuki, H.Shimotono (Dept. of Nuclear Engng., Univ. of Tokyo, Tokyo, Japan), K.Miya, M.Nakazawa, Y.Oka, S.Tanaka, M.Akiyama, H.Hashikura, H.Kobayashi, S.Tagawa.
Nucl. Eng. & Des. (Netherlands), vol.74, no.3, p.377-92 (1982).
UTLIF(1) is a conceptual design study on a light ion beam driven fusion reactor based on a concept of pin-bundle blanket. The study includes nuclear and structural analyses of the blanket, consideration on materials, tritium handling system and power conversion system designs, pellet and beam driver designs, and economic analysis of the plant. The pin-bundle blanket has been shown to be attractive for light ion beam fusion reactors. (16 refs.)

106170 Instability of fusing plasmas and spin-depolarization processes. B.Coppi, F.Pegoraro, J.J.Ramos (MIT, Cambridge, MA, USA).
Phys. Rev. Lett. (USA), vol.51, no.10, p.892-5 (5 Sept. 1983).
A plasma mode driven by the anisotropy of the velocity distribution of charged fusion-reaction products can resonate with the spin precession frequency of one of the plasma components. When these spins are initially polarized, resonant depolarization can occur at a rate considerably faster than the fusion reaction rate, if spatial inhomogeneity effects do not depress excessively the mode amplitude. (6 refs.)

106171 Neutronic evaluations of activations in graphite-thorium assemblies, 14 MeV neutron sources: Comparisons with measurements. S.A.Kushneriuk, P.Y.Wong.
Report AECL-8060, Atomic Energy Canada Ltd., Chalk River, Ont. (April 1983), 52 pp.
Results are presented of neutronic evaluations of activations induced in foils irradiated at various positions within the INRS irradiation facility; comparisons with the results of measurements are made. The activities considered were those induced via the $^{27}Al(n, p)^{27}Mg$, $^{27}Al(n, \alpha)^{24}Na$, $^{63}Cu(n, 2n)^{62}Cu$, $^{127}I(n, 2n)^{126}I$, $^{90}Zr(n, 2n)^{89}Zr$, $^{115}In(n, \gamma)^{116m}In$, $^{197}Au(n, \gamma)^{198}Au$, $^{232}Th(n, \gamma)^{233}Th$ and $^{232}Th(n, f)^{89}Rb$ reactions. The calculations were made using the MORSE Monte Carlo neutronics code. (14 refs.)

106176 Sandia Pulse Reactor personnel dose reduction program. J.S.Philbin, T.F.Luera (Sandia Nat. Lab., Albuquerque, NM, USA).
Trans. Am. Nucl. Soc. (USA), vol.44, suppl., no.1, p.17-19 (1983). (11th Biennial Conference on Reactor Operating Experience 'Plant Startup and Operations in the '80s', Scottsdale, AZ, USA, 1-3 Aug. 1983).
Sandia National Laboratories is undertaking extensive modifications of its Sandia Pulse Reactor (SPR) Facility in the interest of personnel dose reduction and increased experiment throughput. The SPR Facility consists of an instrumentation building, a control building, and a reactor building (or Kiva) in which two bare, fast burst reactors, SPR-II and SPR-III, are operated. Only one reactor is operated at a time in the center of the dome-shaped Kiva. A dose reduction/facility modernization program comprised of several major components was instituted in the summer of 1982. The major components of the program are: modifications of the Kiva; modifications to the SPR-III reactor stand; procurement of a remotely controlled forklift; design, fabrication, and use of a personnel maintenance shield; administrative changes. The goal of the program is to reduce the total radiation exposure of personnel in the operation and maintenance of the reactor by 33%. (no refs.)

106177 Operational quantities for use in external radiation protection measurements. An investigation of concepts and principles.
Report EUR 8346 EN, Comm. European Communities, Luxembourg (1983), 40 pp.
Contains a detailed discussion of the operational quantities used in or proposed for calibration of radiation instruments. This subject is treated in the context of the conceptual basis provided by the definition of quantities for general use with ionising radiation, the selection of quantities for the specification of dose limitations and the requirements specifically applicable to the operational quantities. The emphasis of the report lies on the conceptual foundation of these requirements, such as e.g. additivity, direct measureability, traceability to primary standards within the 'calibration chain', and on the critical discussion of a set of quantities in the light of these requirements. (22 refs.)

106178 Introduction to radiation protection principles. J.M.White.
Report AECL-8057, Atomic Energy Canada Ltd., Chalk River, Ont. (Jan. 1983), 48 pp.
The fundamentals of radiation hazards and their control are outlined. The purposes of the document is to outline the fundamentals of radiation protection, to describe methods that enable employees to work safely with radiation and to acquaint employees with the CRNL radiation and industrial safety organisation.

106179 Practical remote maintenance. J.P.Hamric (Dept. of Energy, Idaho Operations Office, Idaho Falls, ID, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.412
The approach to maintenance at the Idaho Chemical Processing Plant (ICPP) is changing from direct contact to remote. This is because the mission of the ICPP has changed from a pilot plant mode to a production mode. The remote application is achieved by centrally locating high failure components. Piping runs are routed such that the component is located on one side of a remote maintenance corridor and facing shielded windows, closed circuit TV cameras, and remote manipulators. The HEPA filters are also located in the remote maintenance area. Replacement is accomplished with standard mechanical principles as rails and pins for alignment and platform support, lever arm, captured nuts and bolts on flanges, adjustable hooks, pull cables, standard and modified electrical connectors, and mechanical fittings. Finally, the remote maintenance corridor is connected by a shielding labyrinth to a remote decontamination cell so that the failed components can be cleaned for contact repair. (no refs.)

106180 A risk assessment for the transportation of radioactive zeolite liners. R.H.V.Gallucci (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.510-14
The accident risk is estimated for the shipment of two zeolite liners containing radioactive cesium and strontium. Each liner, assumed to hold 68200 Ci and sealed inside a CNS 1-13C, type-B shipping cask, is transported by truck over a 4200-km route. The risk to the population along the route is calculated for potential transportation accidents involving fire, impact, and puncture forces. The total risk is 5.3E-7 man-rem (50-year inhalation dose) and the maximum dose (from the least-likely accident) is 0.7 man-rem. Both estimates are less than 0.1% of comparable risk measures for natural background radiation and spent fuel shipment accidents. (13 refs.)

28.90 OTHER TOPICS IN NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES

106181 Will the United States change its approach to regulation. M.Elliott (Internat. Energy Associates, Washington, DC, USA).
Nucl. Eng. Int. (GB), vol.28, no.345, p.14-16, 23 (Aug. 1983).
Proposals now being debated in Congress are the first significant step in nuclear power licensing and regulation reform in America since the Atomic Energy Act of 1954. The author discusses the background to the proposals and assesses the chances that reforms will be enacted. (no refs.)

106182 The new waste calcining facility at ICPP. R.R.Smith, G.E.Bingham, F.D.Bench (Exxon Nuclear Idaho Co. Inc., Idaho Falls, ID, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.445-8
A new waste calcining facility (NWCF) has been constructed at the Idaho Chemical Processing Plant (ICPP) to replace the waste calcining facility (WCF) that was built to demonstrate fluidized-bed solidification of highly radioactive wastes. The NWCF is designed to produce capability for processing a variety of waste compositions at a higher throughput, more corrosion-resistant materials of construction, more effective cleanup of effluent streams, and extensive remote maintenance and equipment replacement capability. The NWCF also incorporates extensive decontamination capability in the event contact maintenance becomes necessary. Construction was completed in December 1980 and testing is approximately 95% complete, with completion in the spring of 1982. Hot operation is scheduled to begin in mid-year 1982. (4 refs.)

29.15 ELECTROSTATIC AND LINEAR PARTICLE ACCELERATORS

106183 The impedance of an electrodynamic, coaxial plasma accelerator. I.F.Kvartskhava, R.D.Meladze, E.Yu.Khautiev, N.G.Reshetnyak, K.V.Suladze.
J. Eng. Phys. (USA), vol.43, no.5, p.1296-9 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR),* vol.43, no.5, p.837-41 (Nov. 1982). [received: Sept. 1983]
The properties of the impedance of an electrodynamic plasma accelerator are investigated. Drawing upon an analysis of the generalized Ohm's law, the factors resulting in a decrease in impedance, observed when the 'extension currents' of the coaxial gun are blocked, are discussed. (6 refs.)

29.20 CYCLIC ACCELERATORS AND STORAGE FACILITIES

(for plasma accelerators, see 52.75)

106184 Equilibrium bunch length of beam current in electron storage rings. Y.Miyahara (Synchrotron Radiation Lab., Univ. of Tokyo, Tokyo, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.992-5 (June 1983).
A simple formalism for bunch lengthening in electron storage rings is given as an equilibrium state of the electron distribution in the longitudinal phase space, which is determined by the balance of quantum excitation, radiation damping, longitudinal coherent instability and Landau damping of the instability. The parameter dependence of the bunch lengthening is compared with other formulas. A numerical application of the new formula is given for several electron storage rings. (16 refs.)

106185 Fermilab $p\bar{p}$ collider. A.V.Tollestrup.
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.313-50
The author reports on the status of the Fermilab $p\bar{p}$ collider program. The center of mass energy will be 2 TeV, and preliminary running is being planned for mid 1985. In order for this program to come to fruition, three components must be successfully completed: the energy saver, the $\bar{p}$ source consisting of a debuncher and an accumulator ring, and the detectors. (no refs.)

106186 Hadron colliders versus e^+e^- colliders. M.Basile (CERN, Geneva, Switzerland), G.Bonvicini, G.Cara Romeo, L.Cifarelli, A.Contin, M.Curatolo, G.D'Ali, C.Del Papa, B.Esposito, P.Giusti, T.Massam, R.Nania, G.Natale, F.Palmonari, G.Sartorelli, M.Spinetti, G.Susinno, L.Votano, A.Zichichi.
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.409-32
The authors consider the merits of hadron colliders versus e^+e^- colliders, using experimental data observed at the ISR and extrapolated to extreme energies. The new very heavy flavours and multiparticle production are discussed, both favouring very high energy hadron colliders. (29 refs.)

106187 Practical and foreseeable limitations in usable luminosity for the collider. S.van der Meer (CERN, Geneva, Switzerland).
Third Topical Workshop on Proton-Antiproton Collider Physics Proceedings, Rome, Italy, 12-14 Jan. 1983 (Geneva, Switzerland: CERN 1983), p.555-61
The present situation and possible short-term improvements of the $p\bar{p}$ collider are discussed. A long-term plan, aiming at an increase in luminosity by an order of magnitude, is then described. (2 refs.)

Measurement and shielding of the secondary radiation from betatrons ....See Entry 110190

29.25 PARTICLE SOURCES AND TARGETS, PREPARATION AND TECHNOLOGY

(see also 07.77 Particle production and handling; targets)

106188 Optimum sample thickness for total cross section measurements. V.F.Sears (AECL, Chalk River, Ontario, Canada).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.561-2 (1 Aug. 1983).
It is shown that the error in the total collision cross section due to counting statistics is a minimum when the transmission of the sample is 11%. (4 refs.)

106189 The mechanism of implanted ion tapping in thick targets investigated by Mossbauer technique. A.Kotlicki, J.J.Wlodarczyk, A.Wojtasiewicz (Inst. of Experimental Phys., Warsaw Univ., Warsaw, Poland).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.565-6 (1 Aug. 1983).
The mechanism of implanted ion trapping during preparation of thick targets is investigated by the Mossbauer technique. The analysis of Mossbauer spectra of implanted samples has shown that the implanted ions are located in a surface layer which is formed mainly of carbon. (3 refs.)

106190 Electron dynamics and strong ion beam production in magnetically insulated ion diode operated in long pulse mode. Y.Nakagawa (Res. Inst. for Atomic Energy, Osaka City Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L328-30 (June 1983).
By an annular magnetically insulated ion diode operated in long pulse mode, total ion current of 5 kA and ion current density over 30 times the Child-Langmuir limit are achieved. Average length of electron drift by $E\times B$ force in the gap is measured to be about three times the gap length. Based on fundamental theory, the ion production efficiency is estimated by this length to be consistent with the experimental value (20%). The value of $E\times B$ current evaluated from this length is enough to change the applied magnetic field. It is predicted by the theory describing ion flow enhancement. (9 refs.)

106191 A neA?rly mono-energetic 6-7 MeV photon cA?librA?tion source. D.W.O.Rogers (Phys. Div., Nat. Res. Council of Canada, Ottowa, Canada).
Health Phys. (GB), vol.45, no.1, p.127-37 (July 1983).
A photon source has been developed which delivers about 85% of its photon dose equivalent from photons with energies of 6.1, 6.9 and 7.1 MeV produced in the $^{19}F_2(p, \alpha\gamma)^{16}O$ reaction. The source uses up to 50 μA of 2.7 MeV protons incident on a 6 mg/cm^2 target of CaF_2. It produces a photon field with a dose equivalent rate of up to 6 mSv/h (600 mrem/h) over a large area 100 cm from the target. The field can be calibrated in terms of photon fluence to within ±5%. In common with other high-energy photon sources, there is considerable contamination of the field by knock-on electrons and scattered photons. Experiments with various filter materials and detailed Monte-Carlo calculations with the EGS electron-photon transport code have been done to investigate the importance of these contaminants. (18 refs.)

106192 Multigamma-ray calibration sources. R.A.Meyer, T.N.Massey (Nuclear Chem. Div., Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1073-84 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
A self-consistent set of multigamma-ray standards have been calibrated using an automated multi-spectrometer γ-ray counting facility. Pure sources of long-lived activity were produced by mass separation and, or, chemical purification. The sources were counted individually and in combination on several different calibrated spectrometer systems. These systems utilize various detectors ranging from small (X-ray) detectors to large volume high-purity Ge detectors. This has allowed the use of the most ideal individual detector-efficiency characteristics for the determination of the relative γ-ray intensities. Precise energy measurements, reported earlier (Meyer, 1976) have been performed by an independent method. Both the energy and γ-ray-emission probabilities the authors determined compare well with independently established values such as the recent ICRM intercomparison of ^{152}Eu. (25 refs.)

106193 On the density oscillations of a warm particle bunch. P.J.Channell (Los Alamos Sci. Lab., Los Alamos, NM, USA), A.M.Sessler, J.S.Wurtele.
Phys. Fluids (USA), vol.26, no.8, p.2281-91 (Aug. 1983).
The density oscillations of warm particle bunches is investigated theoretically. Two different mathematical approaches are employed to derive the basic equation describing density oscillations; one is a fluid approach and the second is a more general Green's function formulation. The motion is analyzed in first-order perturbation theory where it is shown, under the assumption of no degeneracy, that there are only stable oscillations. Second-order perturbation theory gives damping of the motion. The perturbation theory is examined, and a criterion is exhibited for its proper use. Thus, when the resistivity is large the motion is essentially unstable with a growth rate which is that of an unbunched beam. The criterion is approximately evaluated using a model for a bunched beam. (15 refs.)

106194 Studies of condensed matter with a pulsed neutron source (KENS). Y.Ishikawa (Phys. Dept., Tohoku Univ., Sendai, Japan).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.3-14 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Summarises the experimental results obtained with various spectrometers installed at the KEK pulsed spallation neutron source (PSNS) and, in the light of these results, discusses the potential of the pulsed neutron sources for

the studies of condensed matter researches. Emphasis is placed on the fact that the PSNS can make a new significant contribution to the subjects for research for which the PSNS has long been considered to be unfavourable. (33 refs.)

106195 Pulsed neutrons: one year of experience with the new source at Argonne National Laboratory. G.H.Lander (Argonne Nat. Lab., Argonne, IL, USA).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.15-24 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The Intense Pulsed Neutron Source (IPNS) at Argonne National Laboratory is a spallation neutron source based on a 500 MeV proton accelerator operating at 30 Hz and with an average proton current of ~ 10 μA. Neutron scattering instruments for elastic scattering include two powder diffractometers, a single-crystal diffractometer based on the Laue method and employing a large (30×30 cm) position-sensitive scintillation detector, a small-angle diffractometer using a position-sensitive detector, and a polarised-neutron diffractometer which will utilise the spin-refrigerator device to obtain a beam of white polarised neutrons. For inelastic scattering the system presently has the crystal-analyser spectrometer, and two chopper spectrometers capable of providing monoenergetic incident neutron beams of between 100 and 600 meV. (8 refs.)

106196 Condensed matter research at the Los Alamos pulsed neutron source (WNR). J.Eckert (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.25-30 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The experimental program at the WNR in condensed matter research at present is aimed principally at utilising the high epithermal neutron flux available at a spallation neutron source. Interesting new results have been obtained in several areas including hydrogen vibrations in metals, chemical vibrational spectroscopy and the structure of liquids. For example, extensive vibrational spectra were obtained by hydrogen in Nb which could be described in terms of a three-dimensional localised anharmonic oscillator, deuterium substitution methods were used to determine the variation with O-O distance of the hydrogen bending mode frequency in extremely short intramolecular hydrogen bonds, and model-independent partial structure factors were determined for liquid water. (18 refs.)

106197 A new steady state medium flux neutron source. B.Farnoux, D.Cribier (Lab. Leon Brillouin, CENS, Gif-sur-Yvette, France).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.31-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
A new steady state neutron source is in operation at the Atomic Energy Commission site of Saclay (France). It is a pool type nuclear reactor, using enriched uranium fuel elements together with a heavy water tank as moderator, and is specially designed to provide neutron beams for fundamental and applied research. At full power of 14 Mw, the maximum unperturbed neutron flux reaches 3×10^{14} n/cm^{2}s and the reactor is operated twenty-four hours per day in a three-month cycle. Twenty horizontal neutron beams can be used in the reactor hall or transmitted to a large external hall by cold neutron guides. Several vertical tubes allow radioisotope production and activation analysis. In a first stage, nineteen experimental facilities are planned including thirteen spectrometers for elastic scattering studies and six spectrometers for spectrometry studies. (no refs.)

106198 First experience on the high intensity pulsed reactor IBR-2. I.M.Frank, P.Pacher (Lab. of Neutron Phys., Joint Inst. for Nuclear Res., Dubna, USSR).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.37-44 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The IBR-2 pulsed fast reactor has been constructed in the Laboratory of Neutron Physics, JINR, for scientific research. The tests and power startup of the high flux neutron source based on periodic reactivity modulation are in the course of completion. The operation experience of the reactor is discussed and the measured characteristics are given. Being a pulsed neutron source the IBR-2 can be well combined with the time-of-flight technique and, therefore, the basic field for its application is neutron spectrometry. The first instruments installed for condensed matter and molecular biology investigations are described and the research programme is outlined. (8 refs.)

106199 Polarised neutron scattering using pulsed spallation neutron source at KEK. Y.Endoh, Y.Sasaki, H.Ono, S.Mitsuda (Dept. of Phys., Tohoku Univ., Sendai, Japan), S.Ikeda.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.45-50 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The authors present results of one year's experience with the polarised neutron spectroscopy at the pulsed spallation neutron facility at KEK. They discuss the feasibility of a new method manipulating the dual time indicators of both pulses and neutron spin rotations. (14 refs.)

106200 Characteristics of a thermal neutron source based on an intermediate energy proton accelerator. M.A.Lone, W.N.Selander, B.M.Townes, J.Latouf, E.C.Svensson, G.A.Bartholomew.
Report AECL-7839, Atomic Energy Canada Ltd., Chalk River, Ont. (March 1983), 39 pp.
The envisaged development program leading to a 1 GeV, 300 MW accelerator breeder pilot plant would require construction of three high-current proton test accelerators of progressively increasing energy. These accelerators would also be available to drive neutron sources for other applications. This report explores the characteristics of the high-intensity thermal neutron source that would be provided as part of the Electronuclear Materials Test Facility (EMTF), which is envisaged as a multipurpose test system based on the accelerator of intermediate energy. Two options, a 300 mA CW proton beam at 100 MeV and a 70 mA CW proton beam at 200 MeV are considered. It is shown that the 70 mA, 200 MeV accelerator with a Pb-Bi eutectic target would provide an unperturbed peak thermal neutron flux of $\approx1.5\times10^{15}$ n.cm^{-2}.s^{-1} in a relatively large volume of a D_2O moderator. The 300 mA, 100 MeV accelerator with a Li target and graphite moderator would provide a peak thermal neutron flux of $\approx6.0\times10^{14}$ n.cm^{-2}.s^{-1}. Thermal neutron fluxes in various other moderators and heat limitations in various target configurations are also investigated. (44 refs.)

29.30 RADIATION SPECTROMETERS AND SPECTROSCOPIC TECHNIQUES

106201 Progress in energy resolution of mercuric iodide (HgI_2) X-ray spectrometers. A.J.Dabrowski, W.M.Szymczyk , J.S.Iwanczyk, J.H.Kusmiss (Inst. for Phys. & Imaging Sci., Univ. of Southern California, Marina del Rey, CA, USA), W.Drummound, L.Ames.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.89-94 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
A brief discussion of the main factors which affect the energy resolution of HgI_2 X-ray spectrometers is presented. A short review of the progress made in the process of improving the energy resolution is given. The latest experimental results obtained with a state-of-the-art cryogenically cooled low-noise preamplifier are shown. Ways of lowering the currently attainable room-temperature electronic noise level other than cryogenic cooling are discussed. (13 refs.)

106202 Gamma-ray spectrometry with thick mercuric iodide detectors. A.Beyerle, K.Hull, J.Markakis, B.Lopez (EG&G, Santa Barbara Operations, Goleta, CA, USA), W.M.Szymczyk.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.107-13 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
Gamma-ray spectra with energies up to 1.3 MeV have been detected for the first time with 1 cm thick HgI_2 semiconductor detectors at room temperature. The spectra can be taken using a 'long', 10 μs, or a 'short', 0.5 μs, charge collection time. The latter has produced better results with better peak efficiency, higher peak-to-valley ratio, and fewer low energy counts with little sacrifice in resolution. Spectra for energies between 100 keV and 1.3 MeV and descriptions of the techniques for their acquisition are presented. The thick detectors need a conditioning treatment, which is described, prior to showing spectra response. (8 refs.)

106203 Some remarks on the spiral orbit spectrometer. H.R.Faust, F.Blonnigen (Inst. Laue-Langevin, Grenoble, France).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.545-6 (1 Aug. 1983).
The electron paths in the so called 'spiral orbit' spectrometer are investigated for different magnetic fields. (5 refs.)

106204 A fall-focussing gravity spectrometer for very slow neutrons. M.Utsuro (Res. Reactor Inst., Kyoto Univ., Osaka, Japan).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.557-60 (1 Aug. 1983).
The possibility of a high resolution ($\Delta E\lesssim10^{-7}$ eV) gravity spectrometer working on the principle of fall-focussing of very slow neutrons scattered in 4π-directions is shown. The simultaneous use of the time-of-flight analysis should give a higher energy resolution and also information on the scattering angle. (6 refs.)

106205 Combination source for gamma-ray spectrometry. T.Genka, I.Ishikawa (Dept. of Radioisotope Production, JAERI, Ibaraki-ken, Japan).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1067-72 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
An acrylic-resin-made one-eighth-sector source in which radioactive material was mounted at the angular position was constructed. Sources of this type may be used in various combinations of up to eight sources of the same or different kinds of nuclides, giving a nearly point source configuration. Characterization and performance as well as applications of the combination source are discussed. (8 refs.)

106206 Tables for cascade-summing corrections in gamma-ray spectrometry. F.J.Schima, D.D.Hoppes (NBS, Washington, DC, USA).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1109-14 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
Calculations of the spectral distortion caused by the simultaneous detection of cascade radiations in gamma-ray spectrometry involve terms containing the relative probability for the coincident emission of the radiations involved. The authors present tables of these probabilities ('summing coefficients') for the most probable gamma rays of some frequently encountered radionuclides, to be combined with measured full-energy-peak or total efficiencies of a particular system to calculate emission rates that would be measured without cascade summing. (7 refs.)

106207 Coincidence-summing corrections in gamma-ray spectrometry for normalized geometries. J.Morel, B.Chauvenet, A.Kadachi (LMRI, CENS, Gif Sur Yvette, France).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1115-22 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
Some standardized geometries for γ-ray-spectrometry measurements are presented. The importance of coincidence summing is evaluated for some radionuclides commonly used for calibration purposes. (11 refs.)

106208 A neutron spin echo triple axis spectrometer. C.M.E.Zeyen (Inst. Laue-Langevin, Grenoble, France).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.70 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Summary form only given, as follows. Describes a neutron spin-echo set-up for the ILL D10 triple axis spectrometer. This set-up consists of vertically focusing Heusler alloy polariser/analyser systems, iron yoke spin precession electromagnets mounted on air cushion tables similar to the classical spectrometer tables and air-wound flipper and field correction coils. The polarised neutron intensity in the detector is reduced by a factor of five as compared to the classical TAS with PG crystals. The energy resolution, on the other hand, is improved by two orders of magnitude. This has been demonstrated for

quasielastic scattering where 1 μeV resolution at 15 meV incident energy has been reached. Experiments involving finite energy transfers for phonon lifetime measurements are also reported. (no refs.)

106209 Time-of-flight spectrometer for ultra-cold neutrons. J.W.Lynn, W.A.Miller (Dept. of Phys., Univ. of Maryland, College Park, MD, USA), T.W.Dombeck, G.R.Ringo, V.E.Krohn, M.S.Freedman.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.114-17 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The production and use of ultra-cold neutrons has been by considerable interest in recent years both because of the possibility of increasing the measurement precision of the intrinsic properties of the neutron itself as well as improving the energy resolution of conventional scattering experiments. The authors have constructed a rotating-crystal Doppler shifter at the pulsed neutron source at Argonne which shifts neutrons of speed ~400 m/s into the ultra-cold range (<10 m/s), and used this source to develop a high resolution time-of-flight spectrometer. To demonstrate the utility of those spectrometer they present measurements of iron films evaporated on titanium foils. The data reveal the polarization dependence of the transmission as a function of velocity, as well as the quantum-mechanical interference caused by the waves scattered by the iron and titanium. The data collection rates (at ZING-P′) are about two orders-of-magnitude higher than achieved at other ultra-cold neutron sources. Energy resolution of 10^{-7}-10^{-8} eV is readily achieved. (10 refs.)

106210 A new system of gravity spectrometer with fall focusing of ultra cold neutrons. M.Utsuro (Res. Reactor Inst., Kyoto Univ., Osaka, Japan), Y.Kawabata.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.118-21 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
A high resolution gravity spectrometer for ultra cold neutrons (UCN) and the UCN source of a supermirror turbine are described. The possibilities of the fall focusing of UCN emitted into the 4π or 2π directions to a localized point of a sample or a detector are analysed, and a result it is shown that a focusing mirror arranged in the form of a modified ellipsoid can be used both as a monochromator and as an analyser with the highest geometrical efficiency for UCN. Numerical calculations for a typical case of the proposed spectrometer with an equivalent radius of 50 cm gave an energy resolution of $\sim 2 \times 10^{-8}$ eV in the optimized arrangement for a neutron velocity of 5 m/s. Thus, the proposed system can be used for high resolution experiments of incoherent scattering or low-q coherent scattering with small energy transfer of $\epsilon \lesssim 1$ μeV. (7 refs.)

106211 Design and use of a 6 meter neutron small-angle scattering spectrometer at KUR. S.Komura, T.Takeda, H.Fujii (Faculty of Integrated Arts & Hiroshima Univ., Hiroshima, Japan), K.Osamura, K.Mochiki, K.Hasegawa.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.122-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
A 6 meter neutron small-angle scattering spectrometer has been constructed at the Kyoto University Reactor (KUR) and has been used successfully in various fields of application. The design principles and the characteristics of the spectrometer are described briefly. Some examples of the scattering measurements are presented. (7 refs.)

106212 A resonance detector spectrometer at KENS. J.M.Carpenter, N.Watanabe, S.Ikeda, Y.Masuda, S.Sato (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.126-30 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The authors have tested a resonance detector spectrometer at the KENS neutron source, using ^{181}Ta, ^{121}Sb and ^{149}Sm resonances and bismuth germanate (BGO) scintillators. In the process they encountered and solved numerous background problems, and discovered a time-focusing principle. They measured the scattering from a number of materials and have so far analyzed results for bismuth, vanadium and graphite. Tests of cooled absorbers indicate that resolution of 70 meV is possible with ^{181}Ta. (7 refs.)

106213 Crystal analyser TOF spectrometer (CAT). S.Ikeda, N.Watanabe (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan), K.Kai.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.131-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Reports the design and performance of a high resolution crystal analyzer spectrometer (CAT) which has been built and operated at KENS. Energy resolution of the instrument is $\Delta\epsilon/\epsilon=0.02$-$0.03$ in the range of energy transfer $\epsilon=0.05$-1 eV. The local modes of hydrogen in various metallic hydrides have been measured by this spectrometer. Higher harmonics of the local modes have been observed, and their fine structure, up to 5th order for TiH_2, $ZrH_{1.41}$ and $ZrH_{1.93}$. Anharmonicity parameters of the hydrogen potential for $ZrH_{1.41}$, TiH_2 and $TaH_{0.1}$ (30K) have been determined from their energy shifts relative to the harmonic values. (13 refs.)

106214 Multi-analyser crystal spectrometer (MAX) for pulsed neutron source and its application to various problems. K.Tajima (Dept. of Phys., Keio Univ., Yokohama, Japan), Y.Ishikawa, K.Kanai, S.Tomiyoshi, Y.Todate.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.136-9 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The multi-analyser crystal spectrometer (MAX) is an inverted type TOF spectrometer recently installed at KENS (spallation neutron source at KEK) for inelastic neutron scattering. Fifteen counters in the spectrometer are able to make time-of-flight scans along a desired in reciprocal lattice space, covering a wide range of the energy transfers corresponding to the fifteen analyser crystals. The magnetic excitations in antiferromagnetic γFeMn alloy were measured by the MAX at various temperatures up to 1.5 T_N and the results are demonstrated as the contour map of the intensity in the $\hbar\omega$-Q space. The high energy excitations from the metallic hydrides such as ZrH_2 and VH_2 have also been measured. (5 refs.)

29.40 RADIATION DETECTORS

(for mass spectrometers, see 07.75)

106215 New thermal-neutron solid-state electronic detector based on HgI_2 single crystals. M.Melamud, Z.Burshtein (Nuclear Res. Centre, Negev, Beer Sheva, Israel), A.Levi, M.M.Schieber.
Appl. Phys. Lett. (USA), vol.43, no.3, p.275-7 (1 Aug. 1983).
The use of HgI_2 as a thermal-neutron solid-state electronic detector, in particular its application for neutron diffractometry, is demonstrated for the first time. A single crystal HgI_2 detector is used to count prompt gamma emissions (0.2-5 MeV) from (n,γ) nuclear reactions in Gd or Cd foils. The neutron counting efficiency depends on the HgI_2 detector thickness. For a 1-mm thickness of HgI_2 the efficiency is about 10% compared to the efficiency of a $^{10}BF_3$ gas detector. (15 refs.)

106216 Inductive monopole detector employing planar high order superconducting gradiometer coils. C.D.Tesche, C.C.Chi, C.C.Tsuei, P.Chaudhari (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.384-6 (15 Aug. 1983).
The characteristics and performance of a family of high-order planar gradiometer detectors for inductive detection of magnetic monopoles are discussed. Conventional superconducting magnetometers used for monopole detection must be operated in an extremely stable, low field environment. This places a severe restriction of the cross-sectional area of such detectors. However, planar gradiometer detectors permit the use of relatively large area detectors in coincidence without requiring a corresponding increase in the stability of the ambient field. (4 refs.)

106217 Review of mercuric iodide development program in Santa Barbara. H.A.Lamonds (EG&G, Santa Barbara Operations, Goleta, CA, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.5-12 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
Crystal growth and device fabrication methods used at EG&G Santa Barbara are reviewed. The chemical and structural characterization of the grown crystals are briefly described. The experimental results presented, especially with respect to the spectral response of detectors with thicknesses of 1 cm or more, indicate the large potential of mercuric iodide as a material for future detector applications. (16 refs.)

106218 Technology of high-purity HgI_2. Y.F.Nicolau (Lab. d'Electronique et de Technol. de l'Informatique, CEA-CENG, Grenoble, France).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.13-18 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
The synthesis and purification methods of high-purity HgI_2 by recrystallization, electrolysis and sublimation are reviewed. The results are discussed based on the SSMS analyses. Low temperature sublimation at 135-200°C proves to be less efficient than expected. Distillation at 255°C is more efficient than low temperature sublimation. (27 refs.)

106219 Mass transport, nucleation and monocrystal growth of HgI_2 with the forced flux method. J.Omaly, M.Robert, P.Brisson, R.Cadoret (UER Sci., Aubiere, France).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.19-26 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
Experimental results of mass transport under steady state conditions, analysed with the 1-D diffusion model enable more insight into the properties of the HgI_2 physical vapour transport in a closed tube to be gained. Nucleation of HgI_2 on the glass surface as a function of the supersaturation and temperature analysed with the nucleation theories dealing with the cluster saturation number exhibits a strong interaction with the substrate. Growth rate measurements are in agreement with the BCF or Chernov theories. (19 refs.)

106220 Nuclear response and phase transformation of melt grown, SbI_3-doped HgI_2. J.Nissenbaum, I.Shilo, A.Burger, A.Levi, M.Schieber (School of Appl. Sci & Technol., Hebrew Univ. of Jerusalem, Jerusalem, Israel), L.Keller, C.N.J.Wagner.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.27-30 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
Slow solidification of 1.5 wt.% SbI_3-doped HgI_2 yielded a large-grained polycrystalline boule which in thin section exhibited transparent areas. When these areas were contacted with aquadag, a nuclear radiation counter was produced which showed severe polarization effects. Slow solidification of undoped HgI_2 had no transparent areas. Detector fabricated from sliced sections of that boule gave no response to nuclear radiation. In a crystallographic and a thermodynamic study of SbI_3-doped HgI_2, it was found that an orange-colored high-temperature phase, which is crystallographically identical to the known yellow phase, appeared in all SbI_3-doped HgI_2 samples. (14 refs.)

106221 Fabrication of HgI_2 nuclear radiation detectors by machine cleaving. A.Levi, A.Burger, M.Schieber (School of Appl. Sci. & Technol., Hebrew Univ. of Jerusalem, Jerusalem, Israel), L.Van Den Berg, W.B.Yelon, R.W.Alkire.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.31-4 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
A new device has been designed to facilitate the cleaving of thin sections from bulk crystals of mercuric iodide. Crystallographic perfection of the machine-cleaved sections was established by gamma-ray diffraction rocking curves and was found to be higher than the perfection of hand-cleaved sections or of as-grown thin platelets, approaching the perfection of string-sawn section of HgI_2. A correlation was found between the perfection and thickness of the machine-cleaved sections, i.e., the thicker the section the more perfect it is. Reproducibility of the fabrication was significantly improved by using machine cleaving in the fabrication process. (7 refs.)

106222 Search for improved surface treatment procedures in fabrication of HgI_2 X-ray spectrometers. A.Levi, A.Burger, J.Nissenbaum, M.Schieber (School of Appl. Sci. & Technol., Hebrew Univ. of Jerusalem, Jerusalem, Israel), Z.Burshtein.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.35-8 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
The influence of various fabrication parameters on the surface quality of HgI_2 X-ray spectrometers has been studied in detail. Exposure of etched HgI_2 to ambient atmosphere for $\sim$24 h may reduce the electron surface recombination velocity by almost an order of magnitude. Reduction of the etching solution temperature (KI in water) to about 0°C and an increase of the KI concentration to $\sim$20 wt% are also important. (9 refs.)

106223 Spark source mass spectrographic analyses of α-HgI_2: a comparison of samples from different laboratories. J.T.Muheim, T.Kobayashi, E.Kaldis (Swiss Federal Inst. of Technol., Zurich, Switzerland).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.39-42 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
α-HgI crystals from different laboratories grown at varied conditions show typical concentration spectra for both elemental impurities and hydrocarbon fragments. The average concentration of the various impurities may easily attain a few hundred ppm. This fact is attributed to the layer structure of α-HgI. (4 refs.)

106224 Characterization of extended defects in α-HgI_2 single crystals. S.Gits (Lab. de Mineralogie-Cristallographie, Paris, France).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.43-50 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
The paper deals with firstly the calculation of the direction of growth dislocation lines and the interpretation of the development of plastic defects observed in X-ray topographs, and secondly the characterization of as-grown crystals obtained by the forced-flux method. (8 refs.)

106225 Low temperature photoluminescence of detector-grade HgI_2. J.L.Merz, Z.L.Wu (Dept. of Electrical & Computer Engng., Univ. of California, Santa Barbara, CA, USA), L.Van Den Berg, W.F.Schnepple.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.51-64 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
The low temperature photoluminescence of HgI_2 is reported. Three main luminescence bands are observed, with peaks at $\sim$2.30, 2.20, and 2.00 eV at 77K. At 4.2K, the highest energy peak shows considerable structure. The temperature dependence of these lines indicates both free and bound exciton recombination, and very small exciton binding energies ($\sim$3-5 MeV) have been estimated. A comparison of the results of sublimation and doping experiments suggests that the lowest energy band may be related to impurities, whereas the middle-energy band is related to I content. The two strongest bound exciton lines comprising the high-energy band show systematic correlations with the middle-energy, I-related band. Further correlations between these spectral features and the performance of nuclear radiation detectors fabricated from these samples are also noted. The temperature coefficient of the band gap is estimated from the spectral shift of luminescence lines to be approximately -1.13×10^{-4} eV/K between 32K and 45K. (20 refs.)

106226 Influence of temperature upon dislocation mobility and elastic limit of single crystal HgI_2. F.Milstein, B.Farber, K.Kim (Dept. of Mech. & Environmental Engng., Univ. of California, Santa Barbara, CA, USA), L.Van Den Berg, W.F.Schnepple.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.65-76 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
The practical importance of studying mechanical properties and dislocation structure of HgI_2 is reviewed briefly. Specifically, the performance of single crystal HgI_2 radiation detectors is evidently sensitive to crystalline imperfections, including dislocations. This work examines the influence of temperature upon dislocation mobility and plasticity in vapor grown single crystals of mercuric iodide. Dislocation mobility is determined by measuring the lengths of the longest arms of dislocation etch pit rosettes on (001) surfaces following microhardness indentation and chemical etch. Measurements were made at temperatures ranging from room temperature to the phase transition temperature of 127°C. Dislocation mobility was found to increase with temperature, with the effect accelerating as the 127°C phase transition is approached. Increasing temperature was also found to lower the critical resolved shear stress for plastic deformation or slip on (001) planes. In these contexts, the vapor grown crystals are clearly 'softer' at their elevated growth temperatures. The results are discussed in terms of a dislocation model involving 'soft' and 'hard' glide dislocations. (12 refs.)

106227 Search for correlations between electrical characteristics and stoichiometry in mercuric iodide. A.Tadjine, D.Gosselin, J.M.Koebel, P.Siffert (Groupe de Phys. & Applications des Semiconducteurs, CRN, Strasbourg, France).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.77-82 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
A series of HgI_2 crystals has been grown by the TOM method under various conditions, in order to correlate electrical characteristics, nuclear spectroscopic properties and stoichiometry. It is shown that the peak observed by TSC at 173K plays a major role in the detector's performance. Furthermore, by chemical analysis severe stoichiometric deviations are found, which introduce deep levels. (24 refs.)

106228 Rise time study of mercuric iodide detectors. A.Holzer (Kevex Corp., Foster City, CA, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.83-8 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
A rise time study of mercuric iodide detectors irradiated with gamma ray enables one to identify the influence of several trapping centers on the detection performance of the devices. A careful analysis of the rise time spectra identifies some of the dominant traps as having detrapping times of 300 and 900 ns, and a less intense one as having a detrapping time of 200 ns. These findings have been used to get better performance from the detectors. Discriminating those parts of the pulses that have been subjected to these trapping centers dramatically improves detection performance, especially at high energies. Tuning the electronics to avoid statistical noise due to these traps also improves performance, as does cooling the detector to about 0°C, thus 'freezing' the trapping centers and producing better energy resolution. These modes of operation allow thicker detectors to be used for high energies, still maintaining good performance. At low energies ($\simeq$6 keV), much better energy resolution was obtained. Polarization effects were eliminated, and lower backgrounds and more symmetric peaks were achieved. (8 refs.)

106229 Mercuric iodide imaging detectors. C.Ortale, L.Padgett, W.F.Schnepple (EG&G, Santa Barbara Operations, Goleta, CA, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.95-101 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
Linear and two-dimensional monolithic arrays of different configurations have been fabricated using photolithographic techniques. The fabrication technology, electronic setup, and pinhole imaging experiments are described. Spatial resolutions of 1-2 mm have been achieved. (2 refs.)

106230 Larger volumes of HgI_2 used as portable gamma-ray counters. J.L.Warren (EG&G, Santa Barbara Operations, Goleta, CA, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.103-5 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
Mercuric iodide detectors up to 1.5 cm in thickness and with active areas of up to 17 cm^2 were fabricated and used as room-temperature, portable, gamma-ray counters. Most of the detectors show no photopeak spectral resolution, but the end point energies of various gamma radiation sources are linear with energy. The detectors are biased with about 10^3 V/cm, which can be provided in a portable package with a rechargeable capacitor. The nuclear performance of these counters is described. (4 refs.)

106231 Gamma-ray spectrometry with solid-state detectors by current pulse height analysis. W.M.Szymczyk, A.J.Dabrowski, J.S.Iwanczyk, J.H.Kusmiss, G.C.Huth (Inst. for Phys. & Imaging Sci., Univ. of Southern California, Marina del Rey, CA, USA), K.Hull, A.Beyerle, J.Markakis.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.115-22 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
The traditional way of doing gamma-ray spectrometry with semiconductor detectors depends on being able to collect the ionization charge. In most cases, hole trapping limits the spectrometric performance of room-temperature detectors made from compound semiconductors. Recently it has been shown for thick HgI_2 detectors (A. Beyerle et al., 1983) that significant improvement can be made by using a technique of unconventionally short differentiation of the detector pulses. The present paper presents the concept underlying the technique and gives its theoretical background. The method consists of measuring the amplitude of ionization current pulses before charge collection is completed rather than measuring the amount of charge collected. Hole collection is obviated, and the transport of electrons becomes the most important consideration. The conditions under which this novel method can be applied to various semiconductor materials are discussed. Two different approaches toward the electronic implementation of the technique are compared. (12 refs.)

106232 Scintillation spectrometry with HgI_2 as the photodetector. J.S.Iwanczyk, J.B.Barton, A.J.Dabrowski, J.H.Kusmiss, W.M.Szymczyk, G.C.Huth (Inst. for Phys. & Imaging Sci., Univ. of Southern California, Marina del Rey, CA, USA), J.Markakis, W.F.Schnepple, R.Lynn.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.123-6 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
A mercuric iodide (HgI_2) photodetector has been used to detect light pulses from gamma-ray and alpha-particle interaction in scintillators. The photocurrent response of an HgI_2 photodetector to light has been measured and found to be favorable for detecting light from most scintillators, which have their maximum emission between 400 and 560 nm. Energy spectra for alpha particles or gamma-rays from combinations of an HgI_2 photodetector with various scintillators are presented. The energy resolution of the photopeak from annihilation gamma-rays is 19% with a CsI(Tl) crystal and 24% with a BGO crystal. Fabrication of HgI_2 photodetectors and their optical coupling to a scintillator crystal is described. The advantages of this new solid-state radiation detector compared to the combination of scintillator and PMT, and some proposed applications, are discussed. (12 refs.)

106233 Mercuric iodide (HgI_2) semiconductor devices as charged particle detectors. F.D.Becchetti, R.S.Raymond, R.A.Ristinen (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA), W.F.Schnepple, C.Ortale.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.1, p.127-32 (15 July 1983). (Proceedings of the Fifth International Workshop on Mercuric Iodide Nuclear Radiation Detectors, Jerusalem, Israel, 6-8 June 1982).
The properties of HgI_2 semiconductor devices as charged particle detectors have been investigated. Nearly linear energy response with FWHM resolution of 5-15% is observed for ^{1,2}H and ^{3,4}He ions, $E<40$ MeV. Fast proton damage is observed for $>10^{10}$ protons/cm^2. However, based on measurements with two HgI_2 detectors, little fast neutron damage is apparent at fluences up to 10^{15} neutrons/cm^2. This suggests considerably greater resistance to radiation damage than is observed for Si and other solid state devices. (9 refs.)

106234 A multichannel detector system for small-angle neutron scattering investigations. M.M.Agamalyan, G.A.Panev (Leningrad Inst. for Nuclear Phys., Acad. of Sci., Leningrad, USSR), A.A.Zavedia.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.489-93 (1 Aug. 1983).
Describes a one-coordinate multidetector system for the study of small-angle neutron scattering. The multidetector consists of 41 identical channels, separated by cadmium sheets. The basic element of the system is a standard ^{3}He counter of the SNM-50 type. The distance between the counters is 14.6 mm. The proposed construction assures complete elimination of rescattering in the multidetector and makes it possible to take measurements without a beam-stop. The analysis showed that the ^{3}He counter is responsible for thermal instability of the channels. A procedure of multidetector calibration is developed and small-angle neutron scattering by the block copolymer superlattice is examined. (6 refs.)

106235 **On the use of polyethyleneterephthalate as solid state nuclear track detector: kinetics and mechanism of particle track etching.** H.B.Luck (Akad. der Wissenschaften, Zentralinst. fur Kernforschung, Rossendorf/Dresden, Germany).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.507-11 (1 Aug. 1983).
Kinetics of particle track etching in polyethyleneterephthalate is controlled by different rate-determining mechanisms. While at a low etchant activity the track etch rate v_t depends on the product of water activity and the second power of the hydroxide activity a saturation of v_t is reached at higher etchant activity. For NaOH the whole v_t curve can be calculated in a normality range of 0.25-10 moles/l when the saturation value is known. The discrepancy between the hydroxide activity dependence of the surface etch rate v_s and v_t found at low etchant activity can be explained in terms of the Donnan law and the conduction of over-all electroneutrality in the track solution. The saturation of v_t may be the result of a transport equilibrium between the produced tetraphthalic anions and the hydroxide ions required forr etching at the track tip. The response functions fo both the kinetic regions have been established. (15 refs.)

106236 **Study of ${}_8^{16}$O ion tracks in cellulose nitrate plastic detectors.** S.M.Farid, A.P.Sharma (Dept. of Phys., Kurukshetra Univ., Kurukshetra, India).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.513-15 (1 Aug. 1983).
Cellulose nitrate (CN) plastic track detectors exposed to 8.75 MeV/n ${}_8^{16}$O ions have been obtained from JINR, Dubna, USSR. The bulk etch rate of CN detectors and the track etch rate of ${}_8^{16}$O ions in this detector have been measured for different temperatures. From the data, the activation energy for bulk etching and track etching are calculated. The range of ${}_8^{16}$O ions in a CN detector is determined by measuring the track length. The maximum etched track length agrees with the theoretically computed range as well as with those reported by earlier workers. From the response curve the 'critical energy loss' $(dE/dx)_c$ has been determined for this detector material. (9 refs.)

106237 **Calculations of the peak efficiency of high-purity germanium detectors.** L.Moens, J.Hoste (Inst. for Nuclear Sci., Rijksuniv. Gent, Gent, Belgium).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1085-95 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The applicability of a method for the calculation of the peak efficiency of gamma-ray detectors is experimentally tested for point and cylindrical sources at various distances from a high-purity Ge detector. An overall uncertainty of 3 to 4% was achieved. (13 refs.)

106238 **Detector-efficiency calculation based on point-source measurement.** J.Lippert (Riso Nat. Lab., Roskilde, Denmark).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1097-103 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
Describes an extension of the method for efficiency calculation presented by Moens et al. (Nucl. Instrum. and Methods, vol.187, p.451-72, 1981). Their program allows computation of efficiencies for sources of diameters less than the detector diameter. However it is desirable also to be able to calculate values for sources with diameters larger than the detector diameter such as larger beakers, Marinelli type containers and, for verification, off-axis point sources. To do this, the numerical integration is extended to surface elements on the cylindrical part of the detector. Experimental results show good agreement with the calculated values especially for medium gamma-ray energies. (4 refs.)

106239 **Variation of Ge-detector efficiency with source diameter and radial source position.** R.G.Helmer (Idaho Nat. Engng. Lab., EG&G Idaho Inc., Idaho Falls, ID, USA).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1105-8 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
For two Ge detectors, the γ-ray efficiency obtained with a disk source was determined relative to that for a point source. These ratios were measured by two methods and calculated by a third method and are compared. (2 refs.)

106240 **Multifilament counter with a 5% energy resolution for 5.9 keV photons.** V.D.Peskov, E.R.Podolyak (Inst. of Phys. Problems, Acad. of Sci., Moscow, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1498-1501 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.165-8 (Nov.-Dec. 1982).
Describes a multifilament gas counter with an energy resolution of $\sim$5% (for 5.9 keV photons) and a coordinate resolution of $\sim$0.5 mm. The high energy resolution is obtained by evaluating data on the antennuation of the radiation in the gas volume with the maximum likelihood method. (8 refs.)

106241 **High-frequency power transistor as a pulsed X-ray detector.** V.V.Zykov, V.V.Sil'vestrov (Inst. of Hydrodynamics, Acad. of Sci., Novosibirsk, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1502-4 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.168-70 (Nov.-Dec. 1982).
The authors investigated the possibility of building a pulsed X-ray detector on the basis of the collector-base junction (diode) of KT908 and KT912 high-frequency silicon power transistors. By contrast to the conventional semiconductor detectors, this detector does not require a special production technology nor high supply voltage and is distinguished by a sensitivity capable of reliably recording radiation pulses with a dose rate of 10^5-10^6 rd/sec which is typical for widely employed X-ray equipment. (3 refs.)

106242 **Large area air proportional counter.** N.Akiyama, H.Tatsuta (Atomic Energy Society of Japan, Tokyo, Japan).
J. At. Energy Soc. Jpn. (Japan), vol.25, no.6, p.480-5 (June 1983). In Japanese.
A large area air proportional counter has been developed as an α-ray surface contamination detector. The effective area of the counter is 20×50 cm; to decrease the effect of electron attachment to oxygen molecules, the detector's thickness was made relatively thin (1 cm) and the distance between each anode wire narrow (5 mm). The detection efficiency of the counter was 25% for standard U-source, and the distribution of the efficiency above the window surface was within 10%. The minimum detectable contamination density, when 100 cm^2 area was uniformly contaminated with U-source and measured 10 s, was 1.2×10^{-6} μCi/cm^2. (12 refs.)

106243 **Evaluation of LiYF$_4$ as a neutron scintillation detector.** A.R.Spowart (Phys. Dept., Nat. Inst. for Higher Education, Dublin, Ireland).
J. Phys. D (GB), vol.16, no.9, p.1819-22 (14 Sept. 1983).
LiYF$_4$ doped with 1% Ce, and manufactured using fully enriched 99.6% ${}_3^6$Li, has been evaluated as a neutron detector in a comparison with an optimum form of Ce-doped lithium aluminosilicate glass. Room temperature absorption and excitation spectra are presented and discussed. The pulse height of the ${}_3^6$Li (n,α) reaction using moderated Am/Be neutrons is shown to be a factor of approximately six times poorer than that of the glass. (12 refs.)

106244 **Load characteristics of nonselfquenching counters.** V.I.Shumshurov, M.V.Tel'tsov, Z.G.Zueva, A.N.Antropov (Sci. Res. Inst. of Nuclear Phys., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.56-62 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.50-5 (1982).
The urgency of increasing the speed of operation of nonselfquenching counters is shown; the load characteristics of the counters are considered, together with the basic reasons for their low operating speed and means of eliminating them. An equivalent scheme is proposed for calculating the amplitude and other parameters of the electric pulse, the dependence of the deionization rate on the switching circuit is shown, and a switching circuit allowing the speed of operation of the counters to be increased is described. (18 refs.)

106245 **Position sensitive neutron detectors using ^{6}Li glass scintillators.** N.Niimura, K.Yamada, T.Kubota (Lab. of Nuclear Sci., Tohoku Univ., Sendai, Japan), A.Matsumoto, S.Hoshina.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.104-7 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Position sensitive neutron detectors (PSD) using ^{6}Li glass scintillators and a fibre optic encoding method have been designed, constructed and tested. The area covered by the PSD is 3 cm$\times$28 cm. It was applied to the time-of-flight (TOF) neutron diffraction experiments of a KBr single crystal and a silicon polycrystal. (2 refs.)

106246 **A study of the registration properties of cellulose nitrate KHU.** A.M.Marenny (Inst. for Biomed. Problems, Moscow, USSR), G.P.Hertzen, S.A.Dashin, D.Hasegan.
Rev. Roum. Phys. (Rumania), vol.28, no.5, p.467-70 (1983).
Results of a study of KHU cellulose nitrate detectors produced in the USSR are presented. The following registration properties have been studied: bulk etching rate, track etching rate, registration threshold, critical registration angle, material homogeneity and latent track stability. The obtained results demonstrate that the KHU cellulose nitrate is an effective detector for medium and high energy ion studies. (11 refs.)

29.60 COUNTING CIRCUITS AND NUCLEAR ELECTRONICS

106247 **Simple serial data link.** B.Gottschalk (Harvard Cyclotron Lab., Cambridge, MA, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.547-9 (1 Aug. 1983).
Describes a simple scheme for serial data-swapping between two devices over one line. A specific circuit using TTL logic is presented and explained. It requires a single supply and about a dozen ICs at each end and can transmit well over a megabit/s. (no refs.)

106248 **A time averaged background compensator for Geiger-Muller counters.** R.C.Bhattacharya, P.K.Ghosh (Phys. Res. Wing, Projects & Dev.(India), Dhanbad.Ltd.,India).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.553-5 (1 Aug. 1983).
The GM tube compensator described stores background counts to cancel an equal number of pulses from the measuring channel providing time averaged compensation. The method suits portable instruments. (1 ref.)

106249 **Counting losses from pulsed optical-feedback preamplifiers used with semiconductor detectors.** E.Funck (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1123-31 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
Problems encountered with semiconductor detectors that are coupled to pulsed optical-feedback preamplifiers have been investigated theoretically. The resetting of the preamplifier causes a deadtime followed by a second deadtime during which the counting of pulses in the multichannel analyzer is inhibited. Counts are lost also by the resetting itself, if this is not prevented by special electronics. In order to account for pile-up and deadtime losses the pulse-generator method is frequently applied. It is shown that this method is inadequate for the problem and that the counting losses depend on the detector- and generator-pulse amplitudes. (4 refs.)

29.70 RADIATION MEASUREMENT, DETECTION AND COUNTING

(see also 29.30 Radiation spectrometers and spectroscopy, 29.40 Radiation detectors; for dosimetry, see 87.60M)

106250 **Multiple scattering of protons and deuterons by thick foils.** D.R.Dixon, G.L.Jensen, S.M.Morrill (Dept. of Phys. & Astron., Brigham Young Univ., Provo, UT, USA), R.L.Walter, C.R.Gould.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.525-9 (1 Aug. 1983).
Protons and deuterons from the Triangle Universities Nuclear Laboratory (TUNL) tandem Van de Graaff of energies 3.0, 4.0, and 5.0 MeV were scattered from foils of Al, Ni, Mo and Ta having thicknesses from 6.14 to 47.2 mg/cm^2. Multiple-scattering angular distributions were measured using a

position-sensitive detector to collect data at nine different angles simultaneously. Modified Guassian curves were fitted to the points of the distributions and the angles where the distribution falls to 1/e, 1/10, and 1/100 of its central value are presented. The 1/e data points are compared with calculations using a traditional method of determining multiple-scattering angular distributions. An empirical correction for extending the traditional method into the low-energy and thick-foil region is suggested. (9 refs.)

106251 Energy loss measurements for charged particles and a new approach based on the experimental results. Y.Iga, T.Wada, Y.Yamashita (Dept. of Phys., Okayama Univ., Okayama, Japan), I.Yamamoto.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.531-7 (1 Aug. 1983).
The authors report a new approach to the energy loss process of fast charged particles in gases. This approach gives an analytical formula for the most probable energy loss value. In their approach, common variables are used and the concept of the 'detectable volume' is introduced. Experimental results with fast electrons in an INS-ES test beam are also shown and compared with the calculation. The calculation shows good agreement with the experiments. (19 refs.)

106252 Influence of relative humidity on the charged fraction of decay products of radon and thoron. S.K.Dua, P.Kotrappa, P.C.Gupta (Health Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).
Health Phys. (GB), vol.45, no.1, p.152-7 (July 1983).
A parallel plate mobility analyzer was used for studying the charged fractions. It was found that the diffusion coefficients of the decay products of radon are higher than those of thoron and their values are not influenced by the relative humidity of air for small residence times in the analyzer. The charged fraction of the decay products generally decreases with relative humidity and the decrease is more pronounced at low electric fields. While there is a significant reduction in positively charged decay products of radon at high relative humidity, the decrease is much smaller for thoron decay products. At high electric fields relative humidity plays no significant role in the collection of decay products for the flow conditions studied. (9 refs.)

106253 Needs for radioactivity standards and measurements. W.B.Mann (NBS, Washington, DC, USA).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1041-6 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
At the summer school held in Herceg Novi in 1972, a paper was given on the then contemporary needs in the field of radionuclide metrology. In the intervening years many of the measurements needs have been met and, moreover, the interest in nuclear power in some countries and in its by-products, has waned. Some of the chief interests now lie in the development of the more sensitive methods of measurement such as atom counting to the same level of accuracy as activity measurements, and also in the acquisition of needed and consistent decay data. (14 refs.)

106254 The International Reference System for activity measurements of γ-ray emitting nuclides. A.Rytz (Bureau Internat. des Poids et Mesures, Sevres, France).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1047-56 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The International Reference System was conceived as a complement to, and an extension of, international comparisons of activity measurements organized by the Bureau International des Poids et Mesures (BIPM). The participating laboratories submit samples of their standardized solutions of radionuclides to the BIPM where the current produced by a sample in a stable ionization chamber is compared with the current obtained upon substitution of a radium reference source. A description is given of the equipment used and of auxiliary measurements carried out in order to establish and maintain long-term stability and reliability. The organization of the International Reference System (which to date includes 250 measurements of 42 radionuclides) is explained, as well as the calculation of results and uncertainties. An empirical efficiency curve allows one to make interpolations and predictions of results regarding radionuclides not yet included. (5 refs.)

106255 Accurate evaluation of gamma-ray spectra for the measurement of gamma-ray emission probabilities. R.Jedlovszky, A.Polacsek, A.Andai (Nat. Office of Measures, Budapest, Hungary).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1057-65 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
A brief account is given of the equipment, measuring method, and data processing used for precision gamma-ray spectrometric measurements at OMH. The calculation of the peak area and the OMAN (OMh ANalysis) program package are discussed. The performance of OMAN is discussed in the context of the experimental results. (14 refs.)

106256 Comment on searches for slowly moving magnetic monopoles. S.P.Ahlen (Dept. of Phys., Indiana Univ., Bloomington, IN, USA), D.E.Groom, E.C.Loh, H.R.Nelson, D.M.Ritson.
Phys. Rev. Lett. (USA), vol.51, no.10, p.940-1 (5 Sept. 1983).
Groom et al. (1983) and Bartelt et al. (1983) have recently reported the results of negative searches for slowly moving magnetic monopoles by using arrays of plastic scintillators and proportional counters, respectively. The authors show that the velocity thresholds reported in these papers should be regarded with some caution. (18 refs.)

31.10 GENERAL THEORY OF STRUCTURE, TRANSITIONS AND CHEMICAL BINDING

106258 Strategic design of organic conductors. Structure of a prototypical molecule. J.Y.Becker, J.Bernstein, S.Bittner, N.Levi, S.S.Shaik (Dept. of Chem., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4468-9 (29 June 1983).
To design efficient organic conductors composed of donor (D) and acceptor (A) moieties one must achieve the following necessary conditions: (a) enforce a segregated mode of stacking (...DD...‖...AA...) in the solid state; (b) control the D:A stoichiometry; (c) encode ab initio the desired degree of electron transfer (ρ) into the molecular unit; (d) stabilize the delocalized state, ...$D^{\rho+}D^{\rho+}$...‖...$A^{\rho-}A^{\rho-}$..., below the localized ones (e.g., ...D^+D...‖...A^-A...); (e) permit and control the degree of interchain coupling. The systematic control of these conditions will allow the preparation of organic conductors with predesigned properties. (8 refs.)

106259 Theory of the chemical bond. VI. Accurate relationship between bond energies and electronegativity differences. R.L.Matcha (Dept. of Chem., Univ. of Houston, Houston, TX, USA).
J. Am. Chem. Soc. (USA), vol.105, no.15, p.4859-62 (27 July 1983).
A new formula relating bond energies, D_{AB}, to bond polarities, f, is deduced. The formula has the form $D_{AB}=(1-f)\bar{D}_{AB}+252(f/R_e)$, where R_e is the equilibrium bond length and $D_{AB}=(D_{AA}+D_{BB})/2$ is the arithmetic average of bond energies D_{AA} and D_{BB}. For a random sampling of bonds, predicted bond energies are found to vary from measured ones by an average of about 3%. The formula is used in conjunction with the observation $f/R_e \approx 2i/3$, where $i=1-\exp(-\Delta X^2/4)$ corresponds to Pauling's approximation to ionic character, to deduce the relationship $D_{Ab}=\bar{D}_{AB}+K(1-\exp(-30\Delta X^2/K))$, where $K=103$, ΔX represents electronegativity differences X_A-X_B, and $\bar{D}_{AB}$ equals the geometric average $(D_{AA}D_{BB})^{1/2}$. This relationship is shown to yield accurate bond energy estimates for both ionic and covalent bonds. A comparison with Pauling's formula $D_{AB}=\bar{D}_{AB}+30\Delta X^2$ is given. (10 refs.)

106260 Description of conjugation and hyperconjugation in terms of electron distributions. R.F.W.Bader, T.S.Slee, D.Cremer, E.Kraka (Dept. of Chem., McMaster Univ., Hamilton, Ontario, Canada).
J. Am. Chem. Soc. (USA), vol.105, no.15, p.5061-8 (27 July 1983).
The authors present a description of CC bonds in hydrocarbons in terms of the properties of the charge density ρ at a bond critical point. This is the point ($\mathbf{r}_c$), where ρ attains its minimum value along the path of maximum density (the bond path) linking the nuclei of neighboring atoms. A bond order is defined in terms of ρ_b, the value of ρ at $\mathbf{r}_c$. A measure of the deviation of the charge distribution of a bond path from axial symmetry is provided by the bond ellipticity $\epsilon=\lambda_1/\lambda_2-1$, where λ_1 and λ_2 ($|\lambda_1|>|\lambda_2|$) are the two negative curvatures of ρ at $\mathbf{r}_c$. The value of ϵ is zero for the CC bond in ethane of order 1 and attains some maximum value for CC bonds of order 2. The ellipticity thus provides a quantitative measure of the π character of these bonds and the plane of the π distribution is uniquely specified by the direction of the axis associated with the curvature of smallest magnitude, λ_2. The values of ρ_b and ϵ enable one to translate the electronic effects predicted by orbital models into observable properties of ρ. Conjugative interactions between single and double bonds are reflected by $n>1$ and $\epsilon>0$ for the CC bonds of formal order 1. (27 refs.)

106261 Description of homoaromaticity in terms of electron distributions. D.Cremer, E.Kraka, T.S.Slee, R.F.W.Bader, C.D.H.Lau, T.T.Nguyen-Dang, P.J.MacDougal (Lehrstuhl fur Theoretische Chem., Univ. zu Koln, Koln, Germany).
J. Am. Chem. Soc. (USA), vol.105, no.15, p.5069-75 (27 July 1983).
The authors illustrate how the topological theory of molecular structure can be used to provide an answer as to whether or not homoaromatic conjugation is present in a given system. The study hinges upon the particular properties of a cyclopropyl ring. As a consequence of the proximity of the bond and ring critical points in this system, the ring possesses a surface of delocalized charge, thereby affording a number of possible modes of conjugative interaction with an unsaturated fragment. Depending upon the electronic requirements of the unsaturated system to which it is coupled, the charge distribution of the three-membered ring may be deformed so far as to cause its ring critical point to approach the critical point of one of the ring bonds thereby reducing its bond order and enhancing its ellipticity (i.e. its 'π' character) or conversely cause the same critical point to migrate toward one of the ring

nuclei thereby simultaneously imparting these same properties to two of the ring bonds. (24 refs.)

106262 Generator coordinate method based on coherent states. II. Calculation of vibrational states by the double circular orbit method. K.Deguchi, Y.Kato, A.Sado, K.Nishikawa, S.Aono (Dept. of Chem., Kanazawa Univ., Kanazawa, Japan).
J. Phys. B (GB), vol.16, no.16, p.2871-7 (28 Aug. 1983).
For pt.I see ibid., vol.14, no.18, p.3305-11 (1981). The double circular orbit method (DCOM) is proposed to extend the applicability of the generator coordinate method based on coherent states (COM) which has recently been developed by the authors. The efficiency of the DCOM is examined for the Morse, double minimum and cubic anharmonic potential systems and compared with that of the COM. (7 refs.)

106263 General consideration of electronic transitions in many-electron atoms and ions. Z.B.Rudzikas, J.M.Kaniauskas, G.V.Merkelis, E.H.Savicius (Inst. of Phys., Acad. of Sci., Vilnius, Lithuanian SSR).
J. Phys. B (GB), vol.16, no.16, p.2879-90 (28 Aug. 1983).
The relativistic electric multipole transition operators are considered, not specifying the gauge condition of the electromagnetic field potential. The nonrelativistic limit of the relativistic expressions obtained is found. The relativistic corrections to various forms of the electric dipole transition operators are investigated. The electric multipole transition operator contains an arbitrary parameter, the gauge constant, dependence on which can serve as one of the criteria for the accuracy of the wavefunctions used. Calculated examples of the theory, starting with the general expressions found, are presented. The methods described and the formulae presented allow the authors to investigate in an effective way the electric multipole transitions for atoms and their isoelectronic sequences, including very highly ionised atoms. (31 refs.)

106264 Electric and magnetic dipole contributions to a theory of radiation reaction field and atom self-energy: an operator reaction field. A.-S.F.Obada (Internat. Centre for Theoretical Phys., Trieste, Italy), M.H.Mahran.
Physica A (Netherlands), vol.120A, no.1-2, p.314-26 (1983).
The consequences of including magnetic dipole contributions, besides the electric dipole, are considered in the operators for the radiation field. The Bloch equations which describe the two-level atom operators are modified. These equations together with the field operators are discussed, and the contributions are manifested. The spectrum for spontaneous emission and a generalized dynamical Stark effect are obtained. The Rabi frequency is modified. (18 refs.)

106265 Some aspects of the time-dependent coupled-cluster approach to dynamic response functions. E.Dalgaard (Dept. of Chem., Univ. of Aarhus, Aarhus, Denmark), H.J.Monkhorst.
Phys. Rev. A (USA), vol.28, no.3, p.1217-22 (Sept. 1983).
An approximation scheme for dynamic response functions within the coupled cluster or $\exp(T)$ method of Coester (1960) and Kummel (1978) is described in this paper. Particular attention is given to the relationship between the 'vacuum amplitude' $\langle 0|U(t,-\infty)|0\rangle$ for the time development of an exact eigenstate of a many-electron Hamiltonian in the presence of an adiabatically switched-on perturbation, and the amplitude $\langle\Phi_0|U(t,-\infty)|0\rangle$ for the time evolution into an independent-particle reference state $|\Phi_0\rangle$, which is not orthogonal to $|0\rangle$. The latter amplitude plays a prominent role in the time-dependent coupled-cluster calculation of response functions. (20 refs.)

106266 Collisional relaxation and transfer of coherence in excited atomic multiplets of the type $(j_1j_2;j)=(1,{}^1/_2;{}^3/_2$ or ${}^1/_2)$. K.S.Meyer, R.M.Herman (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1469-86 (Sept. 1983).
Collisional relaxation and transfer of coherence following sudden excitation of a multiplet of the type $(j_1j_2;j)=(1,{}^1/_2;{}^3/_2$ or ${}^1/_2)$ is analyzed theoretically in an attempt to predict the fluorescent intensity as a function of time following excitation. Resonant, pulsed, circularly polarized exciting radiation is considered, with the subsequent fluorescence in each of the three orthogonal optical polarizations being studied. In this type of multiplet the intensity operators form a number of different irreducible tensors, some of which are degenerate with respect to spherical tensor order. These are collisionally mixed, with the result that collisional transfer, as well as relaxation, of coherence occurs, together with a resulting transfer of photobeats between different optical polarizations in fluorescence. As an example, a novel and somewhat surprising result is the prediction of a photobeat collisionally transferred from initially excited σ_- fluorescent polarization to σ_+ fluorescence. With depth of oscillation as large as a few percent, it exists only at higher pressures, where its amplitude varies as the inverse of pressure. Its lifetime is relatively very long, being proportional to pressure, while the photobeat frequency is twice that associated with the energy separation of the excited multiplet. (28 refs.)

106267 Neglect of the target Hamiltonian in corrections to the Glauber approximation. A.Baker (Dept. of Phys. & Appl. Phys., Univ. of Lowell, Lowell, MA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1857-8 (Sept. 1983).
Systematic corrections to the Glauber approximation for the scattering of charged particles by atoms in general include not only the Wallace correction for potential scattering, but also the effect of target-particle motion and energy change. (5 refs.)

31.15 GENERAL MATHEMATICAL AND COMPUTATIONAL DEVELOPMENTS

106268 Evolution of quantum defect methods. II. U.Fano (Dept. of Phys., Univ. of Chicago, Chicago, IL, USA).
Comments At. & Mol. Phys. (GB), vol.13, no.4, p.157-69 (1983).
For pt.I see ibid., vol.10, p.223 (1981). Recent developments keep branching off from earlier procedures, adapting the theory to a wider range of spectral phenomena. These phenomena involve multichannel processes disregarded in an earlier report. (25 refs.)

106269 Perturbation theory for open-shell systems: simulation of the UHF states by means of the perturbed RHF wave functions. I.Hubac (Dept. of Biophys., Faculty of Math. & Phys., Comenius Univ., Bratislava, Czechoslovakia), P.Carsky.
Int. J. Quantum Chem. (USA), vol.24, no.2, p.141-8 (Aug. 1983).
Second-, third-, and selected fourth-order contributions to the correlation energy were calculated for a series of simple open-shell systems by means of the previously developed double-perturbation theory in the restricted MO formalism. It was found possible to assign some of the diagrams to self-consistency effects and to approximate in this way the ${E_{\mathrm{UHF}}}^{\mathrm{SCF}}-{E_{\mathrm{RHF}}}^{\mathrm{SCF}}$ energy difference. A comparison is made with a more rigorous approach, in which the UHF ground-state wave function is expressed as a first-order perturbation expansion based on the RHF reference wave function. Distinguishing between 'self-consistency' and 'correlation' diagrams for open-shell systems in the RHF formulation represents a special case of a more general problem met in any double-perturbation treatment, such as e.g., treatments of systems in the external field or perturbation expansions with noncanonical orbitals. (17 refs.)

106270 Quantum vs. classical calculation of nonlinear spectra-reduced dynamics and intramolecular entropy. S.Mukamel (Dept. of Chem., Univ. of Rochester, Rochester, NY, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2126-33 (1 Sept. 1983).
A nonMarkovian reduced equation of motion (REM) is derived for a generating function $P(a,t;a')$ which allows the calculation of two-time correlation functions in nonlinear systems The form of the REM is identical for classical and quantum systems and it depends on an entropy function $\ln g(a)$, a velocity kernel $W(a,a'')$, and a nonMarkovian kernel $K(a,a'',t)$, a being the expectation value of the dynamical variable under consideration. The author gives exact formal expressions for these quantities for the quantum and the classical case. In the linear (harmonic) limit the REM reduced rigorously to a nonMarkovian Fokker-Planck equation. The present approach may allow a convenient and a systematic way for the calculation and the comparison of classical and quantum nonlinear spectra. (31 refs.)

106271 Comment on 'Force in SCF theories' (and reply). P.Pulay (Dept. of Chem., Univ. of Arkansas, Fayetteville, AR, USA), H.Nakatsuji, K.Kanda, T.Yonezawa.
J. Chem. Phys. (USA), vol.79, no.5, p.2491-5 (1 Sept. 1983).
Nakatsuji et al. (1980, 1981, 1982) suggested an alternative to the analytical gradient method, namely the use of the Hellman-Feynman forces in conjunction with an extended family basis set containing the first derivatives of the original basic functions. Pulay points out that earlier objections to this method have been raised (Pulay, 1977) and presents a more detailed analysis of the extended family technique in the Hartree-Fock case. Nakatsuji et al. discuss the computing time requirements of their method and suggest that the insight provided by their method outweighs its disadvantages. (38 refs.)

106272 Method to determine the number of constants of the motion for mutidimensional systems (polyatomic systems). J.R.Stine (Los Alamos Nat. Lab., Los Alamos, NM, USA), D.W.Nold.
J. Phys. Chem. (USA), vol.87, no.16, p.3038-42 (4 Aug. 1983).
A simple numerical method is presented to determine the number of constants of the motion (integrals) for multidimensional nonseparable Hamiltonians with n degrees of freedom. This method is based on the fact that a trajectory with k constants of the motion will be confined to a $2n$-k dimensional surface of phase space. The method is applied to model systems of two and three degrees of freedom. (11 refs.)

106273 Energy level shifts in atoms near a metallic plane. C.A.Lutken, F.Ravndal (Inst. of Phys., Univ. of Oslo, Oslo, Norway).
Phys. Scr. (Sweden), vol.28, no.2, p.209-13 (Aug. 1983).
The vacuum fluctuations of the electric field will shift the energy levels of an atom near a neutral, conducting plate. The authors have calculated these shifts in Rydberg atoms. The results of Casimir and Polder are recovered in the limit where one ignores any permanent dipole moment in the atom. Numerical values of the shifts of the lowest levels are given. (11 refs.)

106274 Energies of three-particle systems with Coulomb interactions. A.V.Gur'yanov, T.K.Rebane (Leningrad State Univ., Leningrad, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.980-2 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1698-701 (Nov. 1982). [received: Sept. 1983]
The nonrelativistic energy of a symmetric Coulomb system with particle charges $z_1=z_2=\pm1$ and $z_3=\mp1$ and masses $m_1=m_2=m$ and m_3 is expressed in the form $E=m\beta\epsilon(\beta)$, where $\beta=m_3/(2m+m_3)$. An approximate formula for the function $\epsilon(\beta)$, which makes it possible to calculate the energies of the systems for all possible values of the masses m and m_3, is derived. The results of such calculations agree well with previous precise calculations of the energies of symmetric mesic molecules and predict the energies of many diverse Coulomb systems whose energies have not previously been calculated. (13 refs.)

106275 A general population analysis preserving the dipole moment. B.T.Thole, P.T.van Duijnen (Lab. of Chem. Phys., Univ. of Groningen, Groningen, Netherlands).
Theor. Chim. Acta (Germany), vol.63, no.3, p.209-21 (1983).
A new and efficient method is proposed for obtaining atomic charges from molecular wave functions preserving both total charge and dipole moment. The method is independent of the type of wave function (SDF, CI) and does not refer explicitly to the basis set used, nor to integral approximations (e.g. CNDO) applied. The method takes very little time and is better than Mulliken's analysis as a generator of electric potentials. (24 refs.)

31.20 SPECIFIC CALCULATIONS AND RESULTS

106276 Ab initio SCF assignment of vibrational spectra of nitrosomethane. J.P.Dognon, C.Pouchan, A.Dargelos (Lab. de Chimie Structurale, Univ. de Pau, Pau, France).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.316-21 (12 Aug. 1983).
The force constants of nitrosomethane obtained from an SCF wavefunction using a 4-31G basis set are compared with experimental data, which are critically examined. A calculation of intensities was also performed. The theoretical results suggest a new interpretation of the infrared spectrum. (15 refs.)

106277 The validity of Musher's model for the magnetic properties of aromatic molecules. P.Lazzeretti, R.Zanasi (Istituto di Chimica Organica e Centro di Calcolo Elettronico, Univ. di Modena, Modena, Italy).
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.67-9 (26 Aug. 1983).
Plots of proton magnetic shielding density in the benzene molecule, obtained via accurate coupled Hartree-Fock calculations, are reported. They unequivocally show that proton deshielding is due to local effects arising in the adjacent carbon atom and C-H bond. Therefore downfield chemical shifts observed in proton magnetic resonance spectroscopy can be entirely explained in terms of magnetic anisotropy of the carbon environment. This shows the unphysical character of the ring current model and the reliability of Musher's model (1965-7). (15 refs.)

106278 Ab initio studies on hydrogen-bonded chains. III. The linear, infinite chain of hydrogen cyanide molecules. A.Karpfen (Inst. fur Theoretische Chem. und Strahlenchem., Univ. Wien, Vienna, Austria).
Chem. Phys. (Netherlands), vol.79, no.2, p.211-18 (1 Sept. 1983).
Ab initio crystal-orbital calculations have been performed on the linear, infinite chain of HCN molecules applying basis sets from minimal to double-zeta-plus-polarization quality. From computed potential surfaces many properties of the electronic ground state of (HCN)∞ could be deduced. Equilibrium structure, hydrogen-bond energy, dipole moment per molecule, dipole-moment derivatives, harmonic force constants, vibrational frequencies and electronic band structure are reported. Results on the polymer are compared with monomer, dimer and crystal data. (62 refs.)

106279 Orbital SCF energies in the double proton transfer of the adenine-thymine base pair. J.Maranon (Dept. de Fisica, Facultad de Ciencias Exactas Univ. Nacional de la Plata, La Plata, Argentina), H.Grinberg.
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.1081-8 (July-Aug. 1983).
The double-minimum potential generated by proton motion involved in the two hydrogen bonds of the adenine-thymine base pair can be accounted for through the orbital-energy spectrum. The results show that the greatest interaction between the molecular orbitals is found when the interprotonic distance of the protons is optimum, i.e. at the top of the barrier of the double-minimum potential. This raises the question of charge transfer electronic transitions as a possibility of modelling the behaviour of the double proton transfer in the excited states of this base pair. (17 refs.)

106280 Dynamic polarizability of an exactly solvable model of diatomic molecule. C.Guidotti (Istituto di Chimica Fisica, Univ. di Pisa, Pisa, Italy), F.Biondi, N.Durante, G.P.Arrighini.
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.1097-109 (July-Aug. 1983).
A very simple one-dimensional model for a one-electron diatomic molecule under the agency of a homogeneous, time-dependent electric field is investigated in the linear-response approximation. The behaviour of the dynamic polarizability is studied as a function of the frequency ω and the internuclear separation R. (16 refs.)

106281 Symmetry chains for the atomic shell model. IV. Symmetry chains for mixed configuration. M.S.Thomas (Math. Dept., Royal Military Coll. of Canada, Kingston, Ontario, Canada), B.Gruber.
KINAM Rev. Fis. (Mexico), vol.5, no.2, p.173-8 (1983).
For pt.III see ibid., vol.4, p.139 (1982). The symmetry chains for the atomic shell model are discussed that lead from the group $SO\ [8(l_1+l_2)+9]$ to $SO_j(3)$. The super group i$SO[8(l_1+l_2)+9]$ corresponds to a mixed configuration. Not all symmetry chains have been determined. Some useful classification of mixed states are also given. (14 refs.)

106282 Symmetry breaking in the Hartree-Fock approximation for binuclear transition metal compounds—a theoretical investigation based on a variable model operator. M.C.Bohm (Inst. fur Organische Chemie, Univ. Heidelberg, Heidelberg, Germany).
Int. J. Quantum Chem. (USA), vol.24, no.2, p.185-237 (Aug. 1983).
The validity of the Hartree-Fock (HF) approximation in bis(π-pentadienyl)dinickel (1) and in cyclopentadienyl-allyl-cyclobutadiene-dinickel (2) has been investigated by means of the Thouless instability conditions in the computational framework of a variable model Hamiltonian. Singlet, nonsinglet (triplet), and nonreal instabilities in 1 and 2 have been studied as a function of the one-electron resonance integral $\beta_{\mu\nu}{}^{AB}$ and as a function of the one- and two-center elements of the electron-electron interaction. The one-center integrals of Coulomb ($\gamma_{\mu\nu}{}^{AA}$) and exchange-type ($K_{\mu\nu}{}^{AA}$) have been modified by a multiplicative factor; the two-center integrals ($\gamma_{\mu\nu}{}^{AB}$) have been calculated by means of an exponential interpolation formula with a variable decay amplitude. Additionally the Thouless conditions have been studied for nuclear deformations. The stability domain of the HF solution in the model space spanned by the variable INDO Hamiltonian has been analyzed. The nature of the many-body interactions in the unstable region depends strongly on the parametrization of the model operator. HF instabilities in the high-density region (long-range forces) of 1 have their origin in individual particle-hole fluctuations while negative roots for short-range forces (low-density region) are similar to collective excitations in many-body systems (strong off-diagonal coupling). The opposite behaviour is encountered in the Ni complex (2). The physical origin of these different types of correlation processes are analyzed in a simple two-electron two-orbital model. (82 refs.)

106283 Ab initio molecular orbital calculations on the interconversion of allene and propyne cation radicals and the mechanism for hydrogen loss from $C_3H^+{}_4$. G.Frenking, H.Schwarz (Inst. fur Organische Chem., Tech. Univ. Berlin, Berlin, Germany).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.131-8 (1 Sept. 1983).
Ab initio molecular orbital calculations (6-31G*/MNDO) of the $C_3H_4{}^{+\cdot}$ potential energy surface (electronic ground state) reveal the following features. The molecular ions of allene (**1**) and propyne (**2**) are separated by substantial potential energy barriers which preclude easy interconversion. The minimal energy requirement path for the **1**⇄**2** isomerization proceeeds via two successive 1,2-hydrogen migrations and involves the as yet unknown stable, linear $C_3H_2{}^{+\cdot}$ ion **5**. Isomerization via a direct 1,3-hydrogen migration is, if it is involved at all, energetically less favoured. The ion **5** also serves as the central intermediate for ring closure to the cation radical of cyclopropene (**4**), which itself is the actual precursor for loss of $H^\cdot$ thus generating the cyclopropenylium ion (**3**). The complete geometric data of the various $C_3H_4{}^{+\cdot}$ isomers and the transition states connecting them are reported. (15 refs.)

106284 Electronic structure in the intervalence transfer absorption band of a mixed-valence dimer. E.M.Kober, K.A.Goldsby, D.N.S.Narayana, T.J.Meyer (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4303-9 (29 June 1983).
Electronic structure has been observed in the intervalence transfer (IT) absorption band of the weakly coupled mixed-valence dimer $[(bpy)_2ClOs^{II}(PPh_2CH_2Ph_2P)Os^{III}Cl(bpy)_2]^{3+}$ (bpy is 2,2′-bipyridine). The origin of the structure lies in the large spin-orbit (SO) coupling constant (λ_{Os}) for osmium which leads to well separated SO states for the Os^{III} $d\pi^5$ electronic configuration. For Os^{III}-bpy monomers, low-energy $d\pi \rightarrow d\pi$ transitions between the SO states are observed in the near-infrared (near-IR). Optical electron transfer in the mixed-valence dimer results in the formation of a 'new' Os(III) site in one of three possible SO states (1E′, 2E′, or 3E′), and hence the IT manifold should contain three components separated by the energy differences between the SO states at the Os(III) site. In addition to the expected $d\pi$-$d\pi$ absorption bands, the spectrum of the Os(II)-Os(III) dimer in the near-IR shows two broad, solvent-dependent bands which are assignable to IT transitions. The bands are separated in energy by approximately the energy difference between the two lowest SO states as expected. Calculations on the expected position of the third component indicate that it should occur in a spectral region obscured by intense metal-to-ligand charge-transfer bands. (30 refs.)

106285 Interruption of conjugation in polyenes bound to transition-metal fragments. J.W.Chinn,Jr., M.B.Hall (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).
J. Am. Chem. Soc. (USA), vol.105, no.15, p.4930-41 (27 July 1983).
The authors have calculated the molecular orbitals of a large number of molecules in the series $(\eta^n\text{-}C_nH_n)M(CO)_m(XY)$ (n=3-7, m=1-3, XY=CO, N_2, NO, CN). Density difference plots show that the origin of these patterns in the C-C bond lengths is an intramolecular interruption of the conjugated π system of the polyene. The calculations suggest a general rule that C-C bonds in a polyene eclipsed below by a carbonyl or similar ligand will be long while those trans to these ligands will be short. These results are in agreement with recent accurate structures and even with some older structures where the significance of the differences in bond length is questionable. Exceptions to this rule occur for some room-temperature crystal structures in which the C-C distances are not precisely determined and for some systems in which there is a strong specific intermolecular interaction. (63 refs.)

106286 Are the silacyclopentadienyl anion and the silacyclopropenyl cation aromatic?. M.S.Gordon, P.Boudjouk, F.Anwari (Dept. of Chem., North Dakota State Univ., Fargo, ND, USA).
J. Am. Chem. Soc. (USA), vol.105, no.15, p.4972-6 (27 July 1983).
Stabilization energies attributable to aromaticity in the silacyclopentadienyl anion and the silacyclopropenyl cation were found to be small in the former and absent in the latter when calculated from bond-separation reactions employing 3-21G and STO-2G basis sets. The silacyclopentadienyl anion is approximately 25% as aromatic as the all-carbon analogue whereas silabenzene is more than 80% as aromatic as benzene. The introduction of diffuse functions into the basis sets has only a small effect on these results. The silacyclopropenyl cation is actually destabilized but strain is probably a key factor in the comparison. Also found was that the STO-2G basis set gives geometries and relative energies consistent with those of a larger basis set and that the semiempirical INDO method may be useful for predicting the structures of larger systems for which geometry optimizations even with STO-2G may be too time consuming. (18 refs.)

106287 Comments on the cis, trans, and cyclic dimers of NO. J.P.Ritchie (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Phys. Chem. (USA), vol.87, no.14, p.2466-8 (7 July 1983).
Geometry optimizations and force constant calculations have been performed at various levels of theory for the cis, trans, and cyclic isomers of NO. Even at levels including d orbitals, the calculated geometries and relative energies of the cis and trans isomers show substantial errors. σ-aromaticity may play a role in stabilizing the cis isomer. The cyclic structure is verified as a minimum at the SCF level by the calculation of force constants; MINDO/3 and volume calculations lend support to the suggestion that it may be involved in the detonation of NO. (18 refs.)

106288 Lone-pair and core ionization potentials of planar ammonia and phosphine. The use of core and valence ionization potentials to quantify the bonding and antibonding character of molecular orbitals of compounds of nitrogen and phosphorus. C.J.Eyermann, W.L.Jolly (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Phys. Chem. (USA), vol.87, no.16, p.3080-2 (4 Aug. 1983).
For both ammonia and phosphine, the differences between the ionization potentials of the pyramidal and planar forms were calculated by an ab initio SCF method. The lone-pair ionization potential differences, IP(planar)−IP(pyramidal), are −1.0 and −2.3 eV for NH_3 and PH_3, respectively. The core binding energy shifts, E_B(planar)−E_B(pyramidal), are −0.3 and −0.4 eV for NH_3 and PH_3, respectively. By combining these data with appropriate experimental valence and core ionization potentials, it is possible to quantify the bonding or antibonding character of moleculear orbitals of nitrogen and phosphorus compounds. The method is illustrated by using data for several nitrogen- and phophorus-containing species. (20 refs.)

106289 Many-body calculations of atomic properties. I. g_j factors. L.Veseth (Inst. of Phys., Univ. of Oslo, Oslo, Norway).
J. Phys. B (GB), vol.16, no.16, p.2891-12 (28 Aug. 1983).
Many-body perturbation theory has been applied to compute expectation values of the one- and two-electron interactions which yield the relativistic corrections (Abragam-Van Vleck terms) to the atomic g_J factors. A two-electron term due to the motion of the atomic nucleus is also considered. The present calculations are based on analytic expansions of the single-particle states, and a main purpose of the work is to investigate the capability of this method for computations of complex atomic properties. The examples considered are the ground states of the alkali atoms up to rubidium, the ground states of the first-row atoms, and chlorine. The calculations are complete to third order and some fourth-order diagrams are also included. For the first-row atoms energy lowerings ranging from 82-92% of the experimental correlation energies were obtained, showing that a considerable amount of correlation has been included. The computed g_J factors are compared with high-precision experimental values and reasonable agreements for the troublesome cases of nitrogen and the fluorine $^2P_{1/2}$ state are among the present achievements. Correlation effects were in several cases found to be of importance for the computed g_J factors. (28 refs.)

106290 Many-body calculations of atomic properties. II. Spin-orbit coupling. L.Veseth (Inst. of Phys., Univ. of Oslo, Oslo, Norway).
J. Phys. B (GB), vol.16, no.16, p.2913-20 (28 Aug. 1983).
For pt.I see ibid., vol.16, no.16, p.2891-912 (1983). Many-body perturbation theory has been applied to compute the spin-orbit coupling in the ground states of O, F, Al, Si, S and Cl, and in the first excited ^2D state of N and P. The present calculations are based on analytic expansions of the single-particle states and are complete to third order with some important fourth-order diagrams included. In the cases of N, O, Si, P and Cl the present results are found to account for about 80% of the discrepancy between experimental and Hartree-Fock values. For the more troublesome cases of F, Al and S about 60% of the discrepancies are recovered. Core polarisation effects are found to yield the dominant contribution in all cases except fluorine. Correlation contributions were, however, in most cases also found to be of considerable importance. The remaining discrepancies between theoretical and experimental results seem to be mostly related to neglected high-order correlation diagrams. (18 refs.)

106291 Finite-field SCF calculations of the dipole polarisabilities of heavy atoms using relativistic effective potentials. W.J.Stevens, M.Krauss (Nat. Bur. of Standards, Molecular Spectroscopy Div., Washington, DC, USA).
J. Phys. B (GB), vol.16, no.16, p.2921-30 (28 Aug. 1983).
The static dipole polarisabilities of Xe, Lu, Hg^+, Hg, Tl and At have been determined from finite-field SCF calculations within a valence-electron relativistic effective potential formalism. The effect of the self-consistent inclusion of spin-orbit coupling on the calculated polarisabilities have been investigated by comparing j-averaged (L, Λ) results with j-dependent (J,Ω) calculations. The atoms selected provide a range of closed-shell, particle and hole states for comparative study. The results suggest that self-consistent inclusion of spin-orbit coupling is far more important for the particle states than for the hole

states. In the case of Xe, results are presented from calculations using relativistic effective potentials based on both Hamiltonian-consistent and shape-consistent pseudo-orbitals. The shape-consistent approach is found to produce polarisabilities in better agreement with previously determined all-electron Hartree-Fock values. In addition, for Hg the shape-consistent approach yields a polarisability in excellent agreement with all-electron numerical Dirac-Fock calculations. (26 refs.)

106292 A new version of the variational cellular method for polyatomic systems. L.G.Ferreira (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil), M.L.De Siqueira.
J. Phys. B (GB), vol.16, no.17, p.3111-23 (14 Sept. 1983).
The authors present a new version of the variational cellular method of Ferreira and Leite (1979) for the calculation of the electronic structure of polyatomic systems. This version seems to be simple to use, eliminates the muffin-tin potentials and charge densities, and is as fast as the multiple-scattering method. The authors develop programmable procedures for the definition of the cells and choice of points for the surface integrations of polyatomic structures. When applied to methane, the method gave very good results for the energy, interatomic distance, a_1 mode frequency and ionisation energies at a very low computational cost. (21 refs.)

106293 The frozen-core approximation with a nonempirical polarisation potential: the sodium isoelectronic sequence. R.P.McEachran (Dept. of Phys., York Univ., Toronto, Canada), M.Cohen.
J. Phys. B (GB), vol.16, no.17, p.3125-35 (14 Sept. 1983).
Orbital wavefunctions of a large number of levels Na I, Mg II, Al III and Cl VII have been calculated using a frozen-core Hartree-Fock approximation which includes a nonempirical polarisation potential derived from polarised core orbitals. The calculated ionisation energies are in very good agreement with precise measurements. Electric dipole oscillator strengths derived from the computed wavefunctions and energies are found to be of generally high accuracy. (58 refs.)

106294 Ab initio one-electron property calculations. V. Miscellaneous heterocycles and related compounds. G.de Brouckere (Van der Waals Lab., Univ. of Amsterdam, Amsterdam, Netherlands), G.Berthier.
Mol. Phys. (GB), vol.49, no.6, p.1417-41 (20 Aug. 1983).
For pt.IV see ibid., vol.47, no.1, p.209 (1982). SCF one-electron property calculations are reported for p-benzo-quinone, trans-acrolein, trans-glyoxal, α- and γ-pyrone, vinylene carbonate, maleic anhydride, formaldehyde, as well as for a series of three-membered ring systems, that is cyclopropene, ethylenimine, ethylene oxide, ethylene sulphide, methylene cyclopropene, cyclopropenone, cyclopropane. The dipole moments are usually in good agreement with Stark effect measurements except for some small ring systems for which the independent particle model seems to be insufficient. The predicted values of the observables issued from Zeeman microwave experiments are rather good except for ethylenimine. The vertical ionization potentials are generally also in good agreement with the photoelectron spectroscopy data. ^{17}O and ^{14}N nuclear quadrupole couplings are in line with their experimental counterparts for p-benzoquinone, maleic anhydride, formaldehyde and ethylenimine, sole data reported on the above compounds. Deuteron couplings are calculated for all the above molecules too, an excellent agreement with observation being found merely for formaldehyde, the single compound for which these data have been reported. Octupole moments have also been derived. (54 refs.)

106295 Corrections to the orbital magnetic properties for diatomic molecules. J.Rychlewski (Faculty of Chem., A. Mickiewicz Univ., Poznan, Poland).
Mol. Phys. (GB), vol.49, no.6, p.1443-50 (20 Aug. 1983).
The mass-dependent terms which are usually neglected in the calculation of second order orbital magnetic properties for diatomic molecules are derived starting with the spinless hamiltonian. The magnitude of the mass-dependent contributions to the magnetizability and rotational *g*-factor is calculated for the ground state of H_2 and D_2. The correction terms improve the agreement between the theoretical and experimental values, although a small discrepancy for the rotational *g*-factor of H_2 still exists. (13 refs.)

106296 Ab initio SCF-LCAO-MO study of conformational stability and internal rotation in n-butane, ethyl methyl ether and ethyl methyl sulphide. J.L.Bredas, M.Dufey, J.G.Fripiat, J.M.Andre (Lab de Chimie Theorique Appl., Facultes Univ. Notre-Dames de la Paix, Namur, Belgium).
Mol. Phys. (GB), vol.49, no.6, p.1451-60 (20 Aug. 1983).
The authors present STO-3G and 4-31G ab initio SCF-LCAO-MO geometry optimizations on n-butane, ethyl methyl ether and ethyl methyl sulphide. For these three compounds they study and compare the evolution of the geometrical parameters upon internal rotation of the molecule around its central bond, that is from the trans to the gauche conformation, as well as the relative stabilities of the trans and gauche conformers and the barrier to the trans-gauche rotation. (36 refs.)

106297 Diagrammatic perturbation theory: an application to the beryllium dimer using a universal even-tempered basis set. S.Wilson (Dept. of Theoretical Chem., Univ. of Oxford, Oxford, England).
Mol. Phys. (GB), vol.49, no.6, p.1489-93 (20 Aug. 1983).
Diagrammatic many-body perturbation theory is applied to the ground state of the beryllium dimer using a universal even-tempered basis set of exponential-type functions. (15 refs.)

106298 Unique labelling of *J*-states in octahedral symmetry. D.J.Newman (Dept. of Phys., Univ. of Hong Kong, Hong Kong).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.153-4 (22 Aug. 1983).
An induced representation method is used to solve the problem of unique labelling for the components of angular momentum states in octahedral symmetry. (5 refs.)

106299 Gradient-free representation of the Weizsacker term for atoms. R.K.Pathak (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA), S.R.Gadre.
Phys. Rev. A (USA), vol.28, no.3, p.1808-9 (Sept. 1983).
It has been demonstrated that the Weizsacker inhomogeneity term may be replaced by a gradient-free form for atomic systems. This forms a realization of a previous conjecture made by the authors [see ibid., vol.25, p.668 (1982)]. In the variational context, numerical computations have been performed with such a representation with the first-row atoms employed as test cases. The resulting energies are seen to match very well with their Hartree-Fock counterparts. (21 refs.)

106300 Chemical applications of topology and group theory. XIII. Chirality and framework groups. R.B.King (Dept. of Chem., Univ. of Georgia, Athens, GA, USA).
Theor. Chim. Acta (Germany), vol.63, no.2, p.103-32 (1983).
For pt.XII see Inorg. Chem. Acta, vol.57, p.79 (1981). Studies the systematics of chirality arising from different framework groups. In this connection framework groups can be classified into four different types: linear, planar, achiral, and chiral. Chiral framework groups lead to chiral systems for any ligand partition including that with all ligands equivalent. The chirality of four-, five-, and six-site framework groups is discussed in terms of the maximum symmetry ligand partitions resulting in removal of all of the symmetry elements corresponding to improper rotations S_n (including reflections S_1 and inversions S_2) from achiral and polarized planar framework groups. The Ruch-Schonhofer group theoretical algorithms for the calculation of chiral ligand partitions and pseudoscalar polynomials of lowest degree ('chirality functions') are adapted for use with these framework groups. Other properties of framework groups relevant to a study of their chirality are also discussed: these include their transitivity (i.e. whether all sites are equivalent or not), their normality (i.e. whether proper rotations correspond to even permutations and improper rotations correspond to odd permutations), and the number of sites in their symmetry planes. 31.20E Ab initio LCAO and GO SCF calculations

106301 Theoretical study of the structure and reactivity of the pentazole anion. Minh-Tho Nguyen (Lab. voor Quantum Chem., Katholieke Univ. te Leuven, Heverlee, Belgium), J.Elguero, M.Sana, G.Leroy.
Can. J. Chem. (Canada), vol.61, no.7, p.1435-9 (July 1983). In French.
Ab initio LCAO-SCF-MO calculations using the 4-31G basis set were carried out in order to study the supersystem N_5^-. The three possible stable structures (azide ion+molecular nitrogen, pentazene ion and pentazole ion) and their reactions paths were calculated. The pentazole anion is less stable than the reagents $N_3^- + N_2$, but much more stable than the pentazene anion; it could constitute a reasonable synthetic target. The activation energies of the different paths were compared with those of the neutral supersystem N_5H. (20 refs.)

106302 Nonadditive effects of polysubstitution in CH_4 and CH_3: a test of ab initio and semiempirical MO methods. N.C.Baird (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada).
Can. J. Chem. (Canada), vol.61, no.7, p.1567-72 (July 1983).
The effects to the bond lengths and molecular energy of making multiple substitutions at the same carbon atom in methane and the methyl free radical are studied using various molecular orbital methods. All ab initio calculations were based upon the Hartree-Fock formalism (unrestricted in the case of free radicals) and employed the STO-3G (with *d* orbitals on chlorine), 3-21G and 4-31G bases, the last both with and without a set of Gaussian *d* orbitals on the carbon. The semiempirical methods used were the MINDO/3 and MNDO methods; computations for polysubstituted-ethanes by these two methods also are reported. The ab initio methods which use a split valence shell basis set account very well for the trends in bond lengths and heats of formation, at least when the polysubstituent is fluorine or hydroxyl. In contrast, the semiempirical calculations and the ab initio STO-3G results gave very poor results. (20 refs.)

106303 Equilibrium geometries of transition metal complexes. A comparison of approximate molecular orbital theory and experiment. D.S.Marynick, F.U.Axe, C.M.Kirkpatrick, L.Throckmorton (Dept. of Chem., Univ. of Texas, Arlington, TX, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.406-10 (19 Aug. 1983).
Optimized metal-ligand bond distances have been obtained for fifteen transition metal complexes using PRDDO, an approximate molecular orbital method. Of the twenty-nine unique distances, only six are in error by more than 0.05 Å, and the average error is ≈ 0.03 Å. (35 refs.)

106304 Structures and rearrangements of closo-boron hydrides. D.J.Fuller, D.L.Kepert (School of Chem., Univ. of Western Australia, Nedlands, W.Australia, Australia).
Polyhedron (GB), vol.2, no.8, p.749-59 (1983).
The bonding in closo-boron hydrides, $B_nH_n^{2-}$ (where 5-12), is considered to be the sum of all possible $n(n-1)/2$ boron-boron interactions. The bonding energy u between any pair of boron atoms is taken to depend only upon the internuclear distance d, and to be given by $u=1/d^2-1/d$. This scheme can be used to rationalize details of molecular geometry and also allows the relative importance of various intramolecular rearrangement pathways to be assessed. This method is compared with alternative approaches to treating the bonding in these molecules. (33 refs.)

106305 An INDO-CI method in π-approximation for the calculation of transition metal complexes with organic ligands—application to iron(II)-trisdiimine complexes. C.Jung, O.Ristau (Central Inst. of Molecular Biology, Acad. of Sci., Berlin, Germany), C.Jung.
Theor. Chim. Acta (Germany), vol.63, no.2, p.143-59 (1983).
An INDO-CI method in π-approximation extended for transition metal complexes with organic ligands is presented. The σ-polarization in the complex is estimated using a two-dimensional EHT calculation and considered in the π-calculation by means of the diagonal Fock matrix elements. The method is tested for four trisdiimine iron(II) complexes. In agreement with the experimental absorption spectra the calculations show that diimine complexes with non-heterocyclicly bound nitrogen atoms exhibit a large red-shift of the characteristic charge-transfer transition increasing the number of aromatic rings. Contrarily, for diimine complexes with heterocyclicly bound nitrogen atoms no shift of the charge-transfer transition was obtained. (38 refs.)

31.20R Valence bond calculations (ab initio or not)

106307 Coordination 2 of phosphorus: quantum chemical study of P=N and P=C systems. D.Gonbeau, G.Pfister-Guillouzo (Lab. de Phys.-Chimie Moleculaire, IURS, Pau, France), J.Barrans.
Can. J. Chem. (Canada), vol.61, no.7, p.1371-8 (July 1983). In French.
Using ab initio valence double zeta as a basis, a quantum-chemical approach was developed for the models HP=NH and $PH=CH_2$. The geometric parameters were determined by a variable metrics minimization process. The $2p_\pi$-$3p_\pi$ bond forces for P=N and P=C were estimated by evaluating the barriers obtained by a 90° rotation of one part of the molecule with respect to the other. The essential correlation effect was considered and a rigorous RHF formalism was used to determine the state at 90° of lower energy. Different electronic characteristics were found for both motives and according to these results, their reaction behaviour was interpreted: dimerization, addition of polar reactants, and protonation site for HP=NH. (35 refs.)

31.20T Electron correlation and CI calculations

106308 A theoretical investigation of the radiative properties of the CN red and violet systems. M.Larsson (Res. Inst. of Phys., Stockholm, Sweden), P.E.M.Siegbahn, H.Agren.
Astrophys. J. (USA), vol.272, no.1, pt.1, p.369-76 (1 Sept. 1983).
The radiative properties of the CN red and violet systems are studied theoretically using the CASSCF method. The transition moments between the states are determined from wave functions with orbitals optimized for each state separately. For this purpose a recently suggested method is used, where the invariance property of active orbital rotations in a CASSCF wave function is utilized. (28 refs.)

106309 Full CI calibration of model Hamiltonian, large basis set studies of the H_2-H_2 van der Waals interaction. P.G.Burton (Chem. Dept., Univ. of Woolongong, Woolongong, NSW, Australia).
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.51-8 (26 Aug. 1983).
The non-variational CEPA2 PNO ansatz, recently employed in detailed studies of the H_2-H_2 van der Waals interaction by Burton and Senff (1982) and the full CI extrapolation studies on the same system by Burton (1982) are discussed in relation to the explicit full CI study of Harrison and Handy (1983) for the planar T configuration of H_2-H_2 ($R=6.5\ a_0$) in a basis of 80 functions. (26 refs.)

106310 Ab initio CI study of the photodissociation of nitrosyl chloride (ClNO). D.Solgadi, F.Lahmani, C.Lardeux (Lab. de Photophys. Moleculaire, Univ. de Paris-Sud, Orsay, France), J.P.Flament.
Chem. Phys. (Netherlands), vol.79, no.2, p.225-33 (1 Sept. 1983).
Potential-energy curves for the ground and excited singlet states of nitrosyl chloride (ClNO) in the energy region up to 8.5 eV have been calculated by means of the CIPSI method, which combines variation and perturbation techniques in order to take into account electron correlation effects. The calculated dissociation energy D_e for the ground state is 1.58 eV which can be compared with the experimental value of 1.55 eV. The three first A'' and two first A' symmetry states at low energy are all repulsive along the Cl-N coordinate and are responsible for the direct dissociative processes obtained in the 6000-3000 Å energy range. At ≈2000 Å a bound state has been observed which clearly indicates that the photofragmentation in $NO(X)+Cl\ ^2P^0$ is not due to a direct dissociation but shoud involve a predissociative mechanism through a crossing with a triplet state or a rapid internal conversion to the hot ground state. Between 1700 and 1200 Å the electronic states are numerous and involve a large contribution of Rydberg orbitals. These states dissociate towards NO $A^2\Sigma^+$, $C^2\Pi$ and $D^2\Sigma^+$ corroborating experimental observations. (34 refs.)

106311 Electromagnetic properties of BH ($^1\Sigma^+$) using CASSCF wavefunctions. G.T.Daborn, N.C.Handy (Chem. Lab., Univ. of Cambridge, Cambridge, England).
Mol. Phys. (GB), vol.49, no.6, p.1277-88 (20 Aug. 1983).
The perturbation equations for the calculation of static, second order electromagnetic properties at the MCSCF level of approximation are derived and discussed, with particular application to the CASSCF method. Results are given for the energy, electric dipole moment, polarizability and magnetizability of BH at various internuclear distances. In agreement with previous calculations, BH is predicted to be paramagnetic. (26 refs.)

106312 Doubly positive diatomic molecules. I. N_2^{2+}. P.R.Taylor (CSIRO Div. of Chem. Phys., Clayton, Victoria, Australia).
Mol. Phys. (GB), vol.49, no.6, p.1297-314 (20 Aug. 1983).
Calculations on the molecule N_2^{2+} are described. The complete active space SCF (CASSCF) method is used to generate electronic wavefunctions and potential energy curves for a number of bound and unbound N_2^{2+} states. Spectroscopic constants are obtained from rovibrational energy level calculations for the bound states. Details of the computational methods used are given and the computed results are compared with optical spectroscopy, Auger spectroscopy and mass spectroscopy measurements. The agreement between the CASSCF and experimental results is as good as has been observed for other molecules, yielding spectroscopic constants of semi-quantitative accuracy. Natural orbital analyses of the CASSCF wavefunctions are given, but no simple picture of the origins of the binding in N_2^{2+} emerges. All the electronic states are poorly described by a single electronic configuration. (47 refs.)

106313 An ab initio study of the excited states of OH^+. D.M.Hirst (Dept. of Chem. & Molecular Sci., Univ. of Warwick, Coventry, England), M.F.Guest.
Mol. Phys. (GB), vol.49, no.6, p.1461-9 (20 Aug. 1983).
Potential curves have been calculated by the ab initio MRD CI method for states of OH^+ correlating with $O(^3P, {}^1D, {}^1S)+H^+$ and $O^+(^4S, {}^2D, {}^2P)+H$. Spectroscopic constants derived from the calculated potential curves are in good agreement with the available experimental data. The calculations support the experimental assignment of vibrational quantum numbers for levels perturbing the $A^3\Pi$ state. (13 refs.)

106314 An ab initio CI study of the ground and excited states of p-benzoquinone. T.-K.Ha (Lab. of Phys. Chem., Swiss Federal Inst. of Technol., Zurich, Switzerland).
Mol. Phys. (GB), vol.49, no.6, p.1471-9 (20 Aug. 1983).
Configuration interaction (CI) studies of ground, $n\rightarrow\pi^*$, $\pi\rightarrow\pi^*$ electronically excited singlet and triplet states and of the ionized states (cations) are reported for p-benzoquinone. The splittings between two $n\pi^*$ states, both for singlet and triplet, are very small confirming recent experimental results. A lower lying $\pi\pi^*$ triplet state ($^3B_{1u}$) has been thereby assigned. The photoelectron spectra (PES) for the low-energy ionization region have been assigned. Contrary to the MO ordering, $2b_{3g}(\pi_u)$, $1b_{1g}(\pi_g)$, $4b_{3g}(n_g)$, $5b_{2u}(n_u)$, the CI result predicts that the four first PES bands may be assigned to $^2B_{3g}(n_g)$, $^2B_{2u}(n_u)$, $^2B_{3u}(\pi_u)$ and $^2B_{1g}(\pi_g)$ in order of increasing energy. (30 refs.)

106315 Ab initio studies on ONH_3, ONF_3 and OCF_3^-, using polarization functions and configuration interaction methods. F.Grein, L.J.Lawlor (Dept. of Chem., Univ. of New Brunswick, Fredericton, Canada).
Theor. Chim. Acta (Germany), vol.63, no.2, p.161-75 (1983).
SCF geometry optimizations, using double-zeta basis sets with polarization functions, either as *d*-orbitals or bond functions, were performed on ONH_3, ONF_3, and OCF_3^-. The bonding in these molecules is discussed with the help of orbital density plots and Mulliken population analyses. ONF_3 can be explained as donor-acceptor product of O with NF_3. For OCF_3^-, diffuse functions have also been added to the basis set. The *CF* distance is predicted to be 1.39 Å, in qualitative agreement with the known infrared spectrum. With the best basis set, the NF distance as well as the ON distance in excellent agreement with experimental results. (26 refs.)

31.30 CORRECTIONS TO ELECTRONIC STRUCTURE

106316 Nuclear magnetic shielding calculations in the finite perturbation method involving GIAOs at the INDO level and London's approximation. II. Carbon-13 and nitrogen-15. E.C.Vauthier (Univ. Pierre et Marie Curie, Paris, France), S.Fliszar, F.Tonnard, S.Odiot.
Can. J. Chem. (Canada), vol.61, no.7, p.1417-21 (July 1983).
Magnetic shielding constants, calculated for C-13 and N-15 nuclei in the finite perturbation method using INDO and London's approximations, are analyzed in terms of mono-, di-, and tricentric contributions, thus permitting an assessment of the relative importance of local vs. nonlocal contributions. For both C-13 and N-15, it appears that the changes in total shielding are almost entirely dictated by those of the local paramagnetic contribution, i.e. $\Delta\sigma_{total}\simeq\Delta\sigma_{local}{}^P$. (15 refs.)

106317 On the exception values of relativistic corrections to the hamiltonian. I.J.Ketley (Math. Dept., Univ. of Southampton, Southampton, England), R.E.Moss.
Mol. Phys. (GB), vol.49, no.6, p.1289-95 (20 Aug. 1983).
The use of closed form operators and the corresponding power series expanded operators in Foldy-Wouthuysen transformations is discussed. In general, different transformed hamiltonians arise. This is demonstrated using the free electron part of the Dirac hamiltonian; the operators and their expectation values using hydrogenic functions are considered. (7 refs.)

106318 Hyperfine-induced *n* mixing in high Rydberg states of ^{87}Sr. R.Beigang, W.Makat, A.Timmermann, P.J.West (Inst. fur Atom- und Festkorperphys., Freie Univ. Berlin, Berlin, Germany).
Phys. Rev. Lett. (USA), vol.51, no.9, p.771-4 (29 Aug. 1983).
The hyperfine structure of high Rydberg states of ^{87}Sr was studied for principal quantum numbers $80 \leq n \leq 150$. The hyperfine interaction causes a strong singlet-triplet mixing between levels with the same total angular momenta F but different quantum numbers n. Semiempirical calculations show excellent agreement with experiment. (13 refs.)

106319 Broken symmetry in the local-spin-density approximation and its application to relativistic atoms. D.M.Bylander, L.Kleinman (Dept. of Phys., Univ. of Texas, Austin, TX, USA).
Phys. Rev. Lett. (USA), vol.51, no.10, p.889-91 (5 Sept. 1983).
The ground state of the (d^4s^2) configuration shifts by 1.725 eV relative to that of the (d^5s) on going from Mo to W. This shift, which arises mainly from relativistic contributions to the W energy, is calculated with 2% accuracy by use of the authors' relativistic pseudopotential and the local-spin-density approximation. That the single determinantal broken-symmetry local-spin-density approximation wave function accounts for the spin-orbit energy, which otherwise could be obtained from the spin-orbit mixing of several multideterminantal terms, may be surprising. (18 refs.)

106320 $\alpha(Z\alpha)^2E_F$ binding corrections to hyperfine splitting in hydrogenic atoms. J.R.Sapirstein (Newman Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.11, p.985-7 (12 Sept. 1983).
A perturbative expansion of the electron's Dirac Coulomb propagator around a nonrelativistic form is used to evaluate the one-loop nonrecoil corrections to ground-state hyperfine splitting in hydrogenic atoms. A contribution previously estimated as $(\alpha/\pi)(Z\alpha)^2 \times (18.36 \pm 5)E_F$ is found to be $(\alpha/\pi)(Z\alpha)^2 (15.10 \pm 0.29)E_F$. Theory and experiment are compared for muonium hyperfine splitting and consequences for the fine-structure constant are discussed. (17 refs.)

31.50 EXCITED STATES

106321 Rydberg atoms. J.E.Bayfield (Dept. of Phys., Univ. of Pittsburgh, Pittsburgh, PA, USA).
Am. Sci. (USA), vol.71, no.4, p.375-83 (July-Aug. 1983).
The development of lasers has greatly enhanced the range and quality of experiments with Rydberg atoms. These new light sources can be made highly monochromatic and intense. If their wavelength is tuned to an appropriate line of the Rydberg series, they can quickly stimulate transitions of atoms from the ground state to the high energy states that characterize Rydberg atoms. This excitation process can very selectively produce as many as 10^{12} Rydberg atoms in one cubic centimeter of low-pressure gas. Laser spectroscopy of Rydberg atoms has permitted precise determination of the energies and lifetimes of many atoms and has triggered new developments in the theory of multielectron atoms and molecules. (8 refs.)

106322 The $T_3(\pi,\pi^*)$ state of acridine. N.Periasamy (Chem. Phys. Group, Tata Inst. of Fundamental Res., Bombay, India).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.322-5 (12 Aug. 1983).
The 0-0 band maximum of the transition $T_3(\pi,\pi^*) \leftarrow T_1(\pi,\pi^*)$ of acridine occurs at $\approx 10200 \pm 20$ cm^{-1} in inert (*n*-hexane, benzene, CCl_4), at 10220 ± 20 cm^{-1} in polar (acetonitrile) and at 10170 ± 50 cm^{-1} in hydrogen-bonding (methanol, 2-propanol and alkaline water) solvents. Based on the solvent-independent energy of $T_1(\pi,\pi^*)$, the $T_3(\pi,\pi^*)$ state of acridine is estimated at 26050 ± 50 cm^{-1} in all the solvents. (28 refs.)

106323 Cross-quadratic terms involving modes of different symmetry in the nuclear potential of metalloporphyrins. B.Scharf (Dept. of Chem., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.358-63 (12 Aug. 1983).
The existence of cross-quadratic terms involving modes of different symmetry in the nuclear potential of the excited electronic states corresponding to the visible and Soret (UV) bands of metalloporphyrins is elucidated. The 'intrastate' and 'interstate' sources of these terms are discussed for various degrees of mixing of the two lowest excited allowed electronic configurations. (59 refs.)

106324 Comment on the energy variation method [and raply]. H.G.Miller, T.Geveci (Nat. Res. Inst. for Math. Sci., CSIR, Pretoria, S Africa), J.Hendekovic, J.Kucar.
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.115-18 (26 Aug. 1983).
For original paper see J. Hendekovic ibid., vol.90, no.3, p.198 (1982). Miller and Geveci point out that the classical minimax principle plays a significant role in the derivation of Hendekovic's results. They conjecture that Hendekovic's results may be generalized. Hendekovic and Kucar reply by reinforcing the assertion that the energy variation theorem for excited states follows from the classical minimax principle. The problem of minimising the manifold energy of the nonorthogonal basis is also solved. (14 refs.)

106325 Porphyrins. XLIV. Electronic states of Co, Ni, Rh, and Pd complexes. A.Antipas, M.Gouterman (Dept. of Chem., Univ. of Washington, Seattle, WA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.15, p.4896-901 (27 July 1983).
For pt.XLIII see ibid., vol.104, p.6278 (1982). Iterative extended Huckel (IEH) calculations are presented with the aim of understanding the near-UV, visible, and near-IR absorption spectra and the emission properties of Co, Rh, Ir, Ni, Pd, and Pt porphyrins. UV-visible spectra are reviewed for 30 such complexes; new near-IR spectra are presented for Co^{II}, Ni^{II}, and Pd^{II} complexes of octaethyl-and tetraphenylporphyrin (OEP and TPP). It is also reported that three Co^{III} complexes and one Pt^{IV} complex show no emission. While the calculations do not well predict shifts of the visible spectra, they are able to explain quenching by transitions at lower energy than the usual ring phosphorescent state $^3T_1(\pi,\pi^*)$ and fluorescent state $^1Q(\pi,\pi^*)$. In the near-IR absorption, bands in Co^{II} porphyrins corresponding to $^2(\pi,d)$ are reported. The authors also locate absorptions in the near-IR corresponding to the $^2T_1(\pi,\pi^*)$ state of Co^{II}(OEP) and the $^3T_1(\pi,\pi^*)$ states of Pd^{II}(OEP), Pd^{II}(TPP), and $Pt^{IV}(TTP)Cl_2$ [TTP=mesotetratolylporphyrin]. The $^1(\pi,d)$ state of Ni^{IV} and Pd^{IV} porphyrins is expected to the red of 1100 nm, the limit of the current studied. (38 refs.)

106326 Multiphoton excitation and frequency tripling in xenon. Y.Salamero, H.Asselman, A.Birot, H.Brunet, J.Galy, P.Millet (Centre de Phys. Atomique, Univ. Paul Sabatier, Toulouse, France).
J. Phys. B (GB), vol.16, no.16, p.2971-9 (28 Aug. 1983).
The experiment demonstrates at low pressure the resonant excitation of the $^3P_1$ atomic state of xenon by three-photon absorption; as the pressure increases the xenon molecules in the ground state intervene in the absorption process. The emission spectra present the VUV continua characteristic of the excimer. In the same experimental conditions but with observation along the excitation axis, the frequency tripling phenomenon is seen close to the resonance line at 147 nm and the authors have measured new values of the phase matching parameter C_{Xe} between 145 and 147 nm. (12 refs.)

106327 Shake theory predictions of excited-state populations following 1s ionisation in argon. K.G.Dyall (Theoretical Chem. Dept., Oxford Univ., Oxford, England).
J. Phys. B (GB), vol.16, no.17, p.3137-47 (14 Sept. 1983).
A method is presented for the calculation of populations following an ionisation event of individual states of more than one degree of ionisation, in the sudden approximation, using only bound-state wavefunctions. It is applied to 1s ionisation on argon, where it is shown that single excitation is twice as probable as single ionisation from the outer shell, and doubly-excited or singly-excited singly-ionised states have nonnegligible populations. Relativistic effects are found to substantially mix states of different *LS* symmetry, so the monopole selection rules for shake-up/shake-off in *LS* coupling are not strictly obeyed. (24 refs.)

106328 Extension of the measurements of the np $^2P_{1/2,3/2}$ and nd $^2D_{3/2,5/2}$ Rydberg series in neutral indium. G.J.N.E.de Vlieger, H.Wijnen, A.Donszelmann (Zeeman-Lab., Univ. Amsterdam, Amsterdam, Netherlands).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.241-9 (1983).
Stepwise excitation by means of two dye lasers has been used to study the np $^2P_{1/2,3/2}$ and nd $^2D_{3/2,5/2}$ Rydberg levels in indium, with $16 \leq n \leq 31$. The fine structure of the ^2P series shows a hydrogenic behaviour also in this region. The fine structure splitting of the ^2D series varies as n^{*-3} for $n > 35$ and as a linear combination of n^{*-3} and n^{*-5} for $16 \leq n \leq 35$. The perturbation of the nd ^2D series, due to configuration interaction with the $5s5p^2$ ^2D term, is reanalysed. New values for the position of the $5s5p^2$ $^2D_{3/2,5/2}$ levels are given. (17 refs.)

106329 Highly excited hydrogen-atom states located in an external field near the symmetry axis of the field. M.Yu.Sumetskii (Leningrad Electrotech. Communications Inst., Leningrad, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.959-66 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1661-74 (Nov. 1982). [received: Sept. 1983]
Quantization rules are obtained and bands of stability loss in a strong magnetic field as well as in parallel electric and magnetic fields are observed for highly excited hydrogen states concentrated near the symmetry axis of the external field. The band boundaries are identical with the classical resonances at which a classical trajectory lying on the symmetry axis loses stability. The calculation is based on matching of the Schrodinger-equation solutions that are valid near the center of the atom with those valid at a distance from the center and concentrated near the field symmetry axis. The elements of the dipole transitions from the ground state to highly excited states are calculated. In the case of a weak magnetic field the oscillator strengths obtained agree well with the numerical calculations of Clark and Taylor [J. Phys. 13B, L737 (1980)]. For a strong magnetic field as well as for sufficiently weak parallel electric and magnetic fields the oscillator strengths show a spike near one stability-band boundary and a dip near the other. (17 refs.)

106330 The T_1 state of *p*-nitroaniline and related molecules: a CNDO/S study. R.W.Bigelow (Xerox Webster Res. Center, Webster, NY, USA), H.-J.Freund, B.Dick.
Theor. Chim. Acta (Germany), vol.63, no.3, p.177-94 (1983).
The nature of the lowest energy triplet state (T_1) of *p*-nitroaniline (PNA), N,N-dimethyl-*p*-nitroaniline (DMPNA) and nitrobenzene (NB) is rexamined using the semiempirical CNDO/S-CI method with selected parameter options. The results indicate that in the case of the unperturbed molecules the short-axis polarized $\pi^* \leftarrow n(\pi)$ triplet largely localized at the acceptor end of the molecule may lie lower in energy than the triplet manifold counterpart of the intense intramolecular charge-transfer $D^+ \rightarrow A^-$ singlet excitation. Computations suggest, however, that polar solvents strongly stabilize the PNA and DMPNA $\pi^* \leftarrow \pi$ charge-transfer triplet relative to other excitations, whereas specific solvent hydrogen-bonded interactions stabilize the $\pi^* \leftarrow N(\sigma)$ triplet of NM below those of $\pi^* \leftarrow \pi$ character. (63 refs.)

106331 Some problems on the structure of molecules in the electronic excited states as studied by resonance Raman spectroscopy. A.Y.Hirakawa, M.Tsuboi (Faculty of Pharmaceutical Sci., Univ. of Tokyo, Tokyo, Japan).
In book: *Vibrational spectra and structure. A series of advances. Vol.12*, J.R.Durig [Ed.], p.145-204. Amsterdam, Netherlands: Elsevier (1983), xvi+497 pp. [0 444 42197 1]
The authors derive an excited state geometry from a set of observed resonance Raman data, with a brief survey of the theoretical background of this method of derivation, and then review the present status of the application of this method to various molecules. (102 refs.)

(inc. properties other than energy)

106333 Gas-phase thermochemical information from triple quadrupole mass spectrometers: relative proton affinities of amines. S.A.McLuckey, R.G.Cooks (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA), J.E.Fulford.
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.165-74 (1 Sept. 1983).
Proton-bound dimers of amines fragment to give the individual protonated bases in proportions which depend upon the proton affinities of the amines, the collision energy, and the target gas thickness in a triple quadrupole mass spectrometer. The behavior of these dimers observed with the triple quadrupole is similar to that observed with a reversed geometry mass spectrometer suggesting that the kinetic method of assigning amine proton affinities is applicable to the triple quadrupole. This is shown explicitly. The effect of precursor-ion internal energy on this measurement is delineated through MS/MS experiments covering excitation through collisions at various energies and target pressures. The effects of varying target thickness and collision energy are small when structurally similar amines comprise the dimer, but in the cases of dimers of phenylethylamine and pyridine with primary alkylamine partners, differences between literature values of proton affinities and the measured gas-phase basicities are observed. These entropic effects are interpreted on the basis of the relative steric hindrance to protonation of phenylethylamine (PEA), pyridine (PYR) and the primary alkylamines (ALK), that is, the order of steric hindrance appears to be PEA>ALK>PYR. For the primary alkylamine dimers, entropic effects appear to cancel within experimental error. Using data taken under various collision conditions, the proton affinity of 3-aminopentane is assigned as 221.7 ± 0.3 kcal mol^{-1}. (16 refs.)

106334 Measurement of relative oscillator strengths for Ti I. III. Weak transitions from levels a^{3}F$_{3,4}$ (0.02 eV, 0.05 eV), a^{5}F$_{1-5}$ (0.81 eV-0.85 eV), a^{1}D$_2$ (0.90 eV), a^{3}P$_{0-3}$ (1.05 eV-1.07 eV) with solar analysis. D.E.Blackwell, S.L.R.Menon, A.D.Petford (Dept. of Astrophys., Univ. of Oxford, Oxford, England).
Mon. Not. R. Astron. Soc. (GB), vol.204, no.3, p.883-90 (Sept. 1983).
For pt.II see ibid., vol.201, no.2, p.611-7 (1982). Relative oscillator strengths are given for 18 weak 1 eV and two 0 eV lines of Ti I, which has been omitted from the previous study (Blackwell et al. 1982) of 0 eV lines, chosen to be suitable for the analysis of the spectra of cool stars. These lines have been measured with a relative accuracy of 5 per cent using the Oxford furnace technique. The relative values are placed on the absolute scale already derived for stronger 0 and 1 eV lines. A solar analysis is made for the most suitable lines as a test of their oscillator strengths, but this is not regarded as a definite solar analysis because of the weakness of the solar lines. (24 refs.)

106335 Analysis of $3d^74s$-$3d^74p$ transitions in the Zn V spectrum. T.A.M.VanKleef (Zeeman Lab., Univ. van Amsterdam, Amsterdam, Netherlands), Y.N.Joshi.
Phys. Rev. A (USA), vol.28, no.3, p.1446-59 (Sept. 1983).
The spectrum of zinc was photographed in the region 500-2000 Å on 6.65- and 10.7-m normal-incidence spectrographs. The sources used were a triggered spark and a sliding spark. The new observations have led to the establishment of all 38 levels of the $3d^74s$ configuration and 17 unknown levels of the $3d^74p$ configuration of Zn V. The Hartree-Fock and least-squares calculations support the analysis. Four hundred and forty seven additional lines have been classified in this spectrum. (14 refs.)

106336 Spectroscopic observations of the radiative charge transfer and association of helium ions with neon atoms at thermal energy. R.Johnsen (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1460-8 (Sept. 1983).
The radiation emitted by the radiative charge transfer $He^+ + Ne \rightarrow He + Ne^+ + h\nu$ has been observed with the use of a selected-ion drift apparatus in conjunction with spectroscopic instrumentation. The two observed emission features with wavelengths around 4100 and 4240 Å evidently arise from transitions in the short-lived HeNe$^+$ excited molecular ion which is formed in the collision. Mass-spectrometric observations of the product ions indicated that the reaction occurred with a rate coefficient of $1 \pm 0.3 \times 10^{-15}$ cm^3/sec at a gas temperature of 300K. In addition to charge transfer, a second associative reaction channel producing HeNe$^+$ ions is found to have an effective rate coefficient of about 2×10^{-16} cm^3/sec. (13 refs.)

106337 Transition probability measurements of Te I spectral lines by methods of emission and absorption of radiation. A.P.Ubelis, U.V.Berzinsh (Problem Lab. of Spectroscopy, P. Stuchka Latvian State Univ., Riga, Latvian SSR).
Phys. Scr. (Sweden), vol.28, no.2, p.171-5 (Aug. 1983).
The methods of emission and absorption of radiation have been employed for measuring relative transition probabilities of spectral lines in Te I 214.3, 225.9, 238.3, 238.6, 253.1, 277.0 and 296.7 nm. Using known (radiative) lifetimes for the states $5s^25p^36s^3S_1^0$ and $5s^25p^36s^5S_2^0$, absolute values of

transition probabilities have been obtained for the above mentioned lines: $(310\pm12)\times10^6$, $(128\pm4)\times10^5$, $(405\pm35)\times10^5$, $(810\pm65)\times10^5$, $(109\pm8)\times10^4$, $(122\pm40)\times10^4$, $(84\pm34)\times10^2$ s^{-1}, respectively, where the uncertainty is one standard deviation. (18 refs.)

106338 $3p^63d^8$-$3p^53d^9$ transitions in Rb XII and Sr XIII. A.N.Ryabtsev (Inst. for Spectroscopy, Acad. of Sci., Troitsk, USSR).
Phys. Scr. (Sweden), vol.28, no.2, p.176-8 (Aug. 1983).
Spectra of Rb XII and Sr XIII have been studied in the region from 70 to 110 Å by means of a low-inductance vacuum spark and a 3m grazing-incidence spectrograph with a holographic grating 3600 1 mm^{-1}.58 new lines of the $3p^63d^8$-$3p^53d^9$ transitions have been identified. All levels of the relevant configurations have been found. (10 refs.)

106339 Accurate wavelength measurements of He-like resonance lines of titanium through zinc from a high-temperature plasma. S.Morita (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2673-83 (Aug. 1983).
Kα lines of titanium through zinc have been observed from a high-temperature plasma in a vacuum spark. The transition wavelengths of the He-like resonance lines are first determined under careful experimental procedures. The result is compared with theoretical predictions and is in good agreement with that given by Safronova (1981). The theoretical values, however, include uncertainties in relativistic and QED corrections of the He-like resonance line. More accurate theoretical values are required for comparison with these experimental data. (32 refs.)

106340 Spectroscopy of hydrogenlike and heliumlike argon. J.P.Briand, J.P.Mosse, P.Indelicato, P.Chevallier, D.Girard-Vernhet, A.Chetioui (Inst. Curie, Univ. Pierre et Marie Curie, Paris, France), M.T.Ramos, J.P.Declaux.
Phys. Rev. A (USA), vol.28, no.3, p.1413-17 (Sept. 1983).
The X-ray transitions ($n=2\rightarrow n=1$) emitted by fast hydrogenlike and heliumlike argon ions have been studied. The absolute energy of the Lyman α lines of hydrogenlike ions has been measured and the value of the (1s) Lamb shift of argon evaluated for the first time. The $^3P_{1,2}$ and $^1P_1$ transitions of heliumlike argon have also been studied at very high precision and their energies compared to multiconfiguration Dirac-Fock calculations. The energies of Lyman α lines are of 3323.2 ± 0.5 eV (Lyα_1) and 3318.1 ± 0.5 eV (Lyα_2), and those of $n=2\rightarrow n=1$ transitions for heliumlike argon are of 3123.6 ± 0.25 eV ($^3P_1$), 3126.4 ± 0.4 eV ($^3P_2$), and 3139.6 ± 0.25 eV ($^1P_1$). (15 refs.)

106341 The Kα and Kβ X-ray spectra of sodium in metal and some compounds. O.Keski-Rahkonen, K.Reinikainen, E.Mikkola (Lab. of Phys., Helsinki Univ. of Technol., Espoo, Finland).
Phys. Scr. (Sweden), vol.28, no.2, p.179-87 (Aug. 1983).
The $K\alpha$, $K\alpha$ satellite and $K\beta$ X-ray emission spectra of sodium in metal, Na_2O, NaOH, NaF and NaCl have been measured in electron excitation. Energies and intensities of the satellite structures have been obtained and compared with theoretical predictions. The $K\alpha_{5,6}$-group is interpreted in terms of multiplet transitions for the first time. The position of the $K\beta$ band has been compared with many-body calculations for the metal and with a point ion model for the insulators. The shapes of the $K\beta$-lines are discussed in terms of density of states of the bands of corresponding solids. (78 refs.)

106342 Determination of the $KL^2\rightarrow L^3$ X-ray multiplet structure in Na, Mg, and Al. E.Mikkola, O.Keski-Rahkonen, J.Lahtinen, K.Reinikainen (Lab. of Phys., Helsinki Univ. of Technol., Espoo, Finland).
Phys. Scr. (Sweden), vol.28, no.2, p.188-92 (Aug. 1983).
The energies and intensities of $KL^2\rightarrow L^3$ X-ray satellite multiplet lines are determined from high-resolution measurements of metallic samples. The spectra are interpreted in terms of six multiplet transitions arising from $1s^{-1}2p\rightarrow 2p^{-3}$ transitions. Lines including 2s holes are shown to be weak. The relative intensities of the electron excited KL^2 multiplets show marked deviations from the statistical population of initial states in contrast to the KL multiplets. (34 refs.)

(inc. quenching)

106343 Mechanism for the decay of Ar($^3P_2$) atoms in pure argon. Reconciliation of low pressure and high pressure values for the decay constant. E.R.Manzanares, R.F.Firestone (Dept. of Chem., Ohio State Univ., Columbus, OH, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1678-83 (15 Aug. 1983).
A new set of decay constant values for Ar($^3P_2$) in pure argon at 298K determined by means of single frequency CW laser probe spectrophotometry in the 100-700 Torr region is reported. An excimer forming mechanism initiated by a reversible termolecular step and carried forward by a sequence of reversible collisional relaxation stages with provision for radiative decay at each stage is proposed to account for the kinetic behavior of Paschen-1s atoms. It is demonstrated that this mechanism is quantitatively consistent with measured collisional decay constant values at pressures in the 0-22 and 100-700 Torr regions and that adherence of such values to form, $k_{3P2}=AP^2+BP$, is fortuitous and that the values of A and B have no mechanistic significance. It is similarly indicated that the nature of the probable decay mechanism precludes the possibility of recovering excited atom precursor decay constant values by analysis of excimer emission and absorption data without detailed numerical modeling. (22 refs.)

106344 The 'physical spectrum' of the light scattered by a strontium-like atom driven by a pulsed laser. J.Czub, S.Kryszewski (Inst. of Theoretical Phys. & Astrophys., Univ. of Gdansk, Gdansk, Poland).
J. Phys. B (GB), vol.16, no.17, p.3171-82 (14 Sept. 1983).
The numerically computed 'physical spectrum' of light scattered near the collisionally perturbed S_0-P_1 resonance is presented. The authors assume that the strong laser pulse is rectangular, and apply the dressed-atom approach generalized to time-dependent processes. The influence of the interferometer of bandwidth Γ on the obtained spectra is discussed. The authors show that Γ either small or large affects the spectra strongly, thus distorting the information about the atomic system. (15 refs.)

106345 Theory of resonance fluorescence in a fluctuating laser field. W.Vogel, D.-G.Welsch (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany), K.Wodkiewicz.
Phys. Rev. A (USA), vol.28, no.3, p.1546-59 (Sept. 1983).
A method of calculation of multiple-time correlation functions of the resonance fluorescence light from a two-level atom driven by a realistic laser field with phase and amplitude fluctuations is developed. Both kinds of fluctuations are assumed to be Gaussian. The phase fluctuations are treated in the phase-diffusion model. The averaging over the amplitude fluctuations can be performed in a closed way when the relative mean-square amplitude fluctuation is small compared with the ratio of the amplitude correlation decay rate to the characteristic atomic relaxation rate. There is no restriction to Markovian amplitude fluctuations. Arbitrary values for the mean Rabi frequency are allowed. Results are presented for the intensity, the intensity correlation function, and the spectrum of the fluorescent light. It is shown that even in the case when the relative strength of the amplitude fluctuations is small, significant effects can occur due to the finite correlation length of the fluctuations. The results for fast amplitude correlation decay correspond to the situation without amplitude fluctuations. When the correlation time of the amplitude fluctuations becomes comparable with the atomic relaxation times, the Rabi oscillations of the intensity and the intensity correlation function are nearly washed out, and non-Lorentzian line shapes for the side peaks in the spectrum are observed. It is found that the ratio of the heights of the central peak to the side peak increases with increasing correlation time. (38 refs.)

32.60 ZEEMAN AND STARK EFFECTS

106346 Influence of AC Stark shifting on relative rates for two-colour multiphoton ionisation of Xe and Cs. P.Kruit, W.R.Garrett, J.Kimman, M.J.van der Wiel (FOM-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands).
J. Phys. B (GB), vol.16, no.17, p.3191-200 (14 Sept. 1983).
An electron spectroscopic study is reported of multiphoton ionisation of Xe and Cs using two laser beams. One of the two beams is tuned to multiphoton resonance with an intermediate state and causes a considerable AC Stark shift. The second beam acts as a probe of the population and shift of the intermediate state. In Xe the authors deal with a three-photon resonance with the 6s level ($\lambda\simeq440$ nm); in Cs with two-photon resonances with Rydberg levels of the *nd* series. As probes, beams of either $\lambda=1064$ or 532 nm have been used. (8 refs.)

106347 Interpretation of the Stark effect of H^- resonances. C.D.Lin (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1876-8 (Sept. 1983).
Resonances in the photodetachment cross sections of H^- in a strong DC electric field are studied theoretically in hyperspherical coordinates in the adiabatic approximation. In terms of the variation of one-dimensional effective potentials with electric field for different channels, the experimental results of Gram et al. [Phys. Rev. Lett. 40, 107, 1978] are interpreted. In particular, the linear Stark splitting of the Feshbach resonance at low fields and the stability of the shape resonance against electric fields up to a few thousand kV/cm are understood from their associated effective potential curves. A new mechanism of field ionization for the 'blue-shifted' Stark states is also discussed. (9 refs.)

106348 Effects of field-induced splitting of levels having high angular momenta. K.A.Nasyrov, A.M.Shalagin (Inst. of Automation & Electrometry, Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.973-9 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1685-97 (Nov. 1982). [received: Sept. 1983]
The authors investigate manifestations of field-induced splitting in the spectrum of a test field in the presence of a strong field resonant to an adjacent transition in a three-level system with states degenerate in the orientations of the angular momentum. They show that since the splitting effect is different for different M-transitions the spectrum of the test-field operation consists of a set of individual spectral components that can overlap at $J\gg1$ and form a broad common spectrum. They note that the envelope of the integral spectrum includes narrow spectral structures that preserve information on the natural line width. They analyze the dependence of the shapes of the spectra on the types of transitions in a three-level system and on the polarization states of the test and strong fields. For linear and circular polarization of the strong field, the problem is solved by a rigorous quantum-mechanical approach. A classical description of the orientation of the angular momentum is used in the case of elliptic polarization of the strong field. (8 refs.)

Highly excited hydrogen-atom states located in an external field near the symmetry axis of the field .... See Entry 106329

32.70 SPECTRAL LINE SHAPES AND INTENSITIES

106349 Oscillator strengths of $3p^63d^2D\rightarrow3p^53d4s^2P°$, $^2D°$, $^2F°$ transitions in Co IX, Cu XI, and Zn XII ions. S.N.Tiwary (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland).
Astrophys. J. (USA), vol.272, no.2, pt.1, p.781-3 (15 Sept. 1983).
Configuration interaction wave functions have been used to calculate the excitation threshold and the length and velocity form of the oscillator

strengths (f_L and f_V, respectively) for $3p^6 3d^2D \rightarrow 3p^5 3d4s\ ^2P°$, $^2D°$, and $^2F°$ transitions in Co IX, Cu XI, and Zn XII ions of the potassium isoelectronic sequence within the *LS* coupling framework. The agreement between length and velocity values of the oscillator strengths is reasonably good. (9 refs.)

106350 Synchronized quantum beat spectroscopy and its application to the measurement of pressure shifts of the hyperfine splitting in $3^2S_{1/2}$ of sodium atoms. K.Kondo (Dept. of Phys., Kagawa Univ., Takamatsu, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2340-9 (July 1983).
The method of synchronized quantum beat spectroscopy has been improved by introducing amplitude modulation on the excitation pulse train. By using an amplitude-modulated train of picosecond pulses from a CW mode-locked dye laser, the author has obtained resonance enhancement of the substate coherence (quantum beat) at $f_0 = nf_p + n'F_m$ (n, n': integer, f_0: sublevel splitting, f_p: pulse repetition frequency, f_m: modulation frequency), which can be detected by monitoring the optical anisotropy due to the substate coherence. Resonances can be obtained in the frequency domain by sweeping f_m. Pressure shift coefficients of the hyperfine splitting in Na $3^2S_{1/2}$ are measured to be 82, 61, -1 and -47 Hz/Torr for He, N_2, Ar and Kr, respectively, within an accuracy of ± 3 Hz/Torr. (12 refs.)

106351 Measurements of oscillator strengths for the transitions from the metastable ^3P levels of alkaline-earth atoms. IV. Calcium-high-*n* members. K.Ueda (Res. Inst. for Sci. Measurements, Tohoku Univ., Sendai, Japan), Y.Hamaguchi, K.Fukuda.
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2666-72 (Aug. 1983).
Oscillator strengths (f values) for the transitions $4s4p\ ^3P - 4snd\ ^3D$ with $n=6$ to 12 and $-3d5s\ ^3D$ of Ca have been determined relative to those of the multiplet $4s4p\ ^3P - 4p^2\ ^3P$ by means of the hook method. The resulting f values are 12-35% smaller for $n=6$, 7 and 8 than the data of NBS compilation by Wiese et al. Those for other members are first reported in this paper. The spectral density of the f values is found to have a minimum value around $3d5s\ ^3D$ and $4s9d\ ^3D$. This behavior is quantitatively explained by means of a multichannel quantum defect theory.

106352 Radiative and thermal widths of Landau-excited hydrogen atoms in very strong magnetic fields. G.Wunner, H.Herold, H.Ruder (Lehrstuhl fur Theoretische Astrophys., Univ. Tubingen, Tubingen, Germany).
J. Phys. B (GB), vol.16, no.16, p.2937-43 (28 Aug. 1983).
It is proved that in magnetic fields $B \gtrsim 10^7$ T, which are characteristic of neutron stars, the lifetime of an electron in an excited Landau level ($N \geq 1$) bound to a proton becomes identical to that of an electron moving freely along the magnetic field lines, viz. the lifetime with respect to cyclotron transitions. The associated widths are found to be larger than or at least comparable with the Coulomb binding energies (depending on the magnetic field strength) whence the nature of these states as discrete states is obliterated. The authors show that the anomalous magnetic moment of the electron and the finite mass of the proton cause additional level shifts comparable in magnitude with the Coulomb energies. Furthermore, they investigate thermal line broadening and find that, as a consquence of the pronounced anisotropy of the effective masses for motion parallel and perpendicular to the field, thermal broadening is strongly reduced for emission perpendicular to the field. (28 refs.)

106353 Collision broadening and shift of excited *s* states in thallium. J.Kielkopf (Phys. Dept., Univ. of Louisville, Louisville, KY, USA).
J. Phys. B (GB), vol.16, no.17, p.3149-69 (14 Sept. 1983).
The collision broadening by xenon of the 6p-*ns* absorption transitions in thallium has been studied with a high resolution spectrometer and a charge-integrating photodiode array detector. The spectra have excellent signal-tonoise ratio, and can be analysed directly with profiles calculated from unified line broadening theory and a Fermi interaction potential. For the first time, the calculations are made with a numerical potential, rather than an approximate analytical form. This allows meaningful comparisons without the adjustment of potential parameters. The agreement between experimental profiles and these exact unified theory calculations improves with increasing n^* and is quite good for values of n^* greater than 6.25, corresponding to the 11s state. Analysis of line shifts follows the simpler Fermi shift expression at large n^*, as expected. Deviations of the profiles and shifts at smaller n^* from those theoretically expected seem related to the increased size of the effective range theory corrections to the scattering length of the valence electron. Evidence is also presented for the nonlinear dependence of line width on density for large n^* when the impact approximation is not valid. (25 refs.)

106354 Measured lifetimes in mercury using the photon-photon delayed coincidence technique. K.A.Mohamed (Dept. of Phys., Aligarh Muslim Univ., Aligarh, India).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.3, p.225-8 (Sept. 1983).
The photon-photon delayed coincidence technique has been used to measure the 6^3P_1, 7^3S_1, and 7^1S_0 level lifetime in mercury atoms. The measured mean lifetimes are $6^3P_1(116 \pm 5)$ ns, $7^3S_1(7.7 \pm 0.4)$ ns and $7^1S_0(30.5 \pm 4.3)$ ns, respectively. (35 refs.)

106355 Time dependence of absorption lineshapes. F.Bassani (Scuola Normale Superiore, Pisa, Italy), A.Quattropani, R.Girlanda.
Phys. Lett. A (Netherlands), vol.97A, no.4, p.150-2 (22 Aug. 1983).
The authors study the dependence of the absorption lineshape on the time of interaction with the electromagnetic field, taking into account the finite lifetime of the excited state. They find important deviations from the Lorentzian lineshape (broadening of the central peak and oscillatory structures) when the interaction time is comparable with the natural lifetime. Experimental implications are discussed. (12 refs.)

106356 Configuration $1s^2 2s3p$ in the sequence Ne VII-Fe XXIII: level energies and lifetimes. D.G.Ellis (Univ. of Toledo, Toledo, OH, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1223-7 (Sept. 1983).
Energies were computed for the $2s3p$ levels in the Be isoelectronic sequence from $Z=10$ to 26. Multiconfiguration wave functions of form ($2s3p$, $2p3s$, $2p3d$) were obtained from the program MCHF77. The Pauli relativistic corrections were calculated and the 2×2 spin-orbit-interaction matrix was diagonalized to obtain the $^1P_1$-$^3P_1$ interval and mixing coefficient. Results agree with observations and with other self-consistent-field calculations at $Z=10$, 23, and 26. The avoided crossing of the two $J=1$ levels is found to occur at $Z=21$. Finally, the radiative-decay probabilities of the mixed $J=1$ levels were calculated; results are compared with other calculations and checked against a recent experiment in Ne VII. (20 refs.)

106357 Concerning a long-lived $(^2P^e)\mathrm{He}^-$ state: lifetime and energy-level measurements of He^-. G.D.Alton, R.N.Compton (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), D.J.Pegg.
Phys. Rev. A (USA), vol.28, no.3, p.1405-12 (Sept. 1983).
The question concerning the existence of a long-lived doublet $(^2P^e)\mathrm{He}^-$ state has been addressed by measuring the lifetime and energies of autodetaching electrons from 20-120-keV He^--ion beams formed by charge exchange in Ca vapor—a vapor conducive with $(^2P^e)\mathrm{He}^-$ formation. The measured lifetime and electron energy levels agree closely with accepted values for components of the $(^4P_J{}^0)\mathrm{He}^-$ states. No other structures were detected in the electron energy spectrum encompassing the anticipated energy level of the autodetached electron from the $(^2P^e)\mathrm{He}^-$ state. (33 refs.)

106358 Radiative transition rates of collisionally perturbed atoms in an intense monochromatic field. F.Schuller (Lab. des Interactions Moleculaires et des Hautes Pressions, CNRS, Villetaneuse, France), G.Nienhuis.
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.281-94 (1983).
The authors study the collisional perturbation of the absorption rate and the fluorescence rate of an atom in a strong monochromatic radiation field. The field dependence of the binary-collision relaxation operator is included and they adopt a perturbation expansion of this operator to second order in the atom-perturber interaction. The resulting expression for the relaxation operator can be expressed in terms of the frequency-dependent width and shift that determine the line profile as measured at low intensity. (17 refs.)

106359 Observation of optical pumping effects in collinear atomic beam-laser beam(s) interaction. N.Bendali, H.T.Duong, J.M.Saint Jalm, J.L.Vialie (Lab. Aime Cotton, CNRS, Orsay, France).
J. Phys. (France), vol.44, no.9, p.1019-23 (Sept. 1983).
The detection of optical resonances by observation of the fluorescence light emitted from a fast atomic beam of Na interacting with a collinear laser beam is limited in sensitivity by optical pumping processes. In the experiment reported, the authors take advantage of the optical pumping by using a second collinear laser beam, achieving then a gain in fluorescence signal. The effects of the lasers power and polarization on line shapes have been studied in the single laser excitation case as well as in the two laser beams one. (14 refs.)

32.80D Autoionization

106360 Study of the autoionising states of the hydrogen atom in intense magnetic fields by the complex coordinate coupled-channel formalism. S.K.Bhattacharya, Shih-I Chu (Dept. of Chem., Univ. of Kansas, Lawrence, KS, USA).
J. Phys. B (GB), vol.16, no.16, p.L471-7 (28 Aug. 1983).
The study of autoionising resonances of a hydrogen atom in intense magnetic fields is formulated as a complex coordinate coupled-channel problem by designating each channel by a Landau quantum number which characterises a set of Coulomb levels below its continuum threshold. For magnetic fields in the range of 4.70×10^9 to 1.175×10^{12} G, the authors have calculated the positions and widths of several autoionising resonances below the first two excited Landau thresholds. (21 refs.)

106361 Extractoion of accurate autionisation widths from the emission spectrum of doubly-excited He. H.Cederquist, M.Kisielinski, S.Mannervik (Res. Inst. of Phys., Stockholm, Sweden).
J. Phys. B (GB), vol.16, no.16, p.L479-84 (28 Aug. 1983).
The autoionisation width of the 2s2p $^3P^0$ level in He I has been determined through measurements of the widths of three different optical transitions, namely 2s2p $^3P^0$-2p3p $^3P^e$, 2s3p $^3P^0$-'2p3p' $^3D^e$ and 2s2p $^3P^0$-'2p4p' $^3D^e$ giving the results 7.12 ± 0.12, 8.36 ± 0.08 and 8.32 ± 0.15 meV respectively. As a tentative explanation for the extra broadening of transitions with $^3D^e$ states as initial states the authors suggest that $^3D^e$ states but not $^3P^e$ states have an unusually large fine-structure splitting. (18 refs.)

106362 On the excitation of the lowest autoionisation state in alkali atoms. R.Peterkop, A.Liepinsh (Inst. of Phys., Acad. of Sci., Riga, Latvian SSR).
J. Phys. B (GB), vol.16, no.16, p.L505-7 (28 Aug. 1983).
The difference in electron impact excitation cross sections of various calculations has been discussed. The results of the authors are confirmed by means of the Bethe formula. (11 refs.)

106363 Autoionizing states of the hydrogen atom in strong magnetic fields. H.Friedrich, M.Chu (W.K. Kellogg Radiation Lab., California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1423-8 (Sept. 1983).
For a hydrogen atom in a uniform magnetic field in the range $B \approx 2.35 \times 10^8$-$2.35 \times 10^9$ G the authors have calculated the energies and widths of resonant states which can autoionize by decay of a Landau excitation. The autoionization widths are quite large with some lifetimes as short as 10^{-15} sec. The widths decrease with increasing azimuthal quantum number $|m|$, hydrogenic quantum number, or magnetic field strength. With decreasing field strength the lower resonances approach the ionization threshold which they cross with finite width and a pseudoresonance structure of finite width persists below threshold in the quantum defects of the bound states. Because of the finite widths, there are no approximate level crossings as these resonances cross the ionization threshold. (24 refs.)

32.80F Photoionization and photodetachment

106364 Collision free generation of highly ionized atomic species with 193 nm radiation. T.S.Luk, H.Pummer, K.Boyer, M.Shahidi, H.Egger, C.K.Rhodes (Dept. of Phys., Univ. of Illinois, Chicago, IL, USA).
AIP Conf. Proc. (USA), no.100, p.341-4 (1983). (Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983).
The generation of highly ionized iodine (3+), xenon (5+), and mercury (4+) atoms at pressures of $\sim 10^{-6}$ Torr and laser intensities of $\sim 10^{14}$ W/cm^2 at 193 nm is described. A minimum energy in excess of 170 eV, corresponding to ≥ 27 photons, is required to produce Xe^{5+}. (6 refs.)

106365 Angular distribution of Kr 4s$\rightarrow\varepsilon$p photoelectrons: a test of current theory. A.Fahlman, T.A.Carlson, M.O.Krause (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
J. Phys. B (GB), vol.16, no.16, p.L485-8 (28 Aug. 1983).
The angular asymmetry parameter β for Kr 4s$\rightarrow\varepsilon$p photoelectrons has been studied using synchrotron radiation ($h\nu = 31$-63.5 eV). The present results show that earlier calculations based on the relativistic random-phase approximation (RRPA) do not satisfactorily describe the Kr 4s photoionisation process close to the Cooper minimum. This lack of agreement has also been found recently for the Xe 5s excitation. The experimental results are compared with a new, not yet published, theoretical approach which gives good agreement with experiment. (16 refs.)

106366 Photoionisation of Cs 6p and Cs 7p subshells. A.Z.Msezane (Dept. of Phys., Morehouse Coll., Atlanta, GA, USA).
J. Phys. B (GB), vol.16, no.16, p.L489-93 (28 Aug. 1983).
Photoionisation of Cs 6p and Cs 7p subshells has been calculated in the Hartree-Fock approximation (HF) using accurate wavefunctions. The Cs 6p cross sections are in agreement with other theoretical results and experiment near threshold. For Cs 7p the calculation reproduces the measured values of the asymmetry parameter β and the cross section. Good agreement is obtained with the RPA result of Cherepkov (1981). (22 refs.)

106367 Electron angular distributions and total cross sections for photoionisation of polarised Ne($3p^3D_3$) atoms near threshold. A.Siegel, J.Ganz, W.Bussert, H.Hotop (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany).
J. Phys. B (GB), vol.16, no.16, p.2945-59 (28 Aug. 1983).
The authors have measured photoelectron angular distributions for resonant two-photon ionisation of metastable Ne($3s\ ^3P_2$) via Ne($3p\ ^3D_3$) at 0.52 eV photoelectron energy. They derive: (i) the alignment of the Ne($3p\ ^3D_3$) state; (ii) the ratio of the reduced matrix elements for the 3p$\rightarrow\varepsilon$d and 3p$\rightarrow\varepsilon$s transitions and (iii) the difference of the phaseshifts in the final channels. For the absolute cross section at 0.52 eV they find $(2 \pm 1) \times 10^{-18}$ cm^2. At four different photoelectron energies between threshold and 0.7 eV they have studied the dependence of the total cross section on the angle between the polarising and ionising laser fields. These results are analysed to give the ratio of the above mentioned matrix elements at these energies. (28 refs.)

106368 Resonant vacuum ultraviolet photoemission of atomic Fe, Co and Ni. E.Schmidt, H.Schroder, B.Sonntag, H.Voss, H.E.Wetzel (II. Inst. fur Experimentalphys., Univ. Hamburg, Hamburg, Germany).
J. Phys. B (GB), vol.16, no.16, p.2961-9 (28 Aug. 1983).
The photoemission of atomic Fe, Co and Ni has been obtained in the photon energy range 50-80 eV. The strong coupling of the $3p^6 3d^n 4s^2 \rightarrow 3p^5 3d^{n+1} 4s^2$ excitations with the $3p^6 3d^n 4s^2 \rightarrow 3p^6 3d^{n-1} 4s^2$, $3p^6 3d^n 4s$ ionisation of the outer 3d and 4s shells leads to a resonant enhancement of the photoemission lines above the 3p threshold. For Ni the contributions of the $3p^6 3d^8 4s \rightarrow 3p^5 3d^9 4s^2$ and $3p^6 3d^9 4s \rightarrow 3p^5 3d^{10} 4s$ transitions can in part be separated. (32 refs.)

106369 Photoionisation spectrum of Te I: autoionising series and relative cross section. M.Mazzoni, A.M.Cantu (Osservatorio Astrofisico di Arcetri, Firenze, Italy), Y.N.Joshi.
J. Phys. B (GB), vol.16, no.17, p.3183-90 (14 Sept. 1983).
The absorption spectrum of neutral tellurium was obtained in the region 400-1400 Å by flash pyrolysis technique. Of 60 absorption lines observed, many of them autoionising, 48 have been identified as arising out of seven series converging on the $5p^3\ ^2D_{3/2}{}^0$ and $5p^3\ ^2D_{5/2}{}^0$ limits of Te II. The relative photoionisation cross sections to the levels of $5p^3\ 4^S{}_{3/2}{}^0$, $^2D_{3/2,5/2}{}^0$ and $^2P_{1/2,3/2}{}^0$ of Te II have been obtained, and the results are compared with the previously known theoretical values of absolute photoionisation cross sections in the same region. (23 refs.)

106370 Radiative collision-induced electron continuum-continuum scattering. M.Nayfeh, D.B.Geohegan (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1395-400 (Sept. 1983).
The photoionization of an atom is examined in the presence of a foreign atom. The authors find that a two-photon radiative collision process induces large cross sections for electron continuum-continuum scattering. The enhancement is caused by an intensity-induced collisional shift which, when used to cancel out the collisional dephasing between the initial and final scattering states at wide range of internuclear separations, enhances the electron continuum-continuum scattering process. (6 refs.)

106371 Observation of Cooper minima in excited-*s*-state photoionization cross sections in neon and argon. N.S.Kopeika (Dept. of Electrical & Computer Engng., Ben Gurion Univ., Beer Sheva, Israel), R.Shuker, Y.Yerachmiel, Y.Gabai, C.S.Ih.
Phys. Rev. A (USA), vol.28, no.3, p.1517-26 (Sept. 1983).
Observations of Cooper minima in excited-state photoionization cross sections for the Ne 3*s* and Ar 4*s* levels are reported. Prebreakdown Ne and Ar discharges under irradiation by light in the 200-400-nm wavelength range yield spectral dependences of photoionization cross sections with minima at the ionization threshold of these states in Ne and slightly distant from them in Ar. They are in close agreement with certain theoretical predictions. Autoionization structure which exists between the two ionization limits $^2p_{3/2}$ and $^2p_{1/2}$ was not observed in any of the Ne or Ar photoionization spectra due to both low spectral resolution of the high density of levels in this spectral region. Application of these measurements to ultraviolet-radiation detection is examined. High detection sensitivity of ultraviolet light is indicated. (40 refs.)

106372 Photoionization by intense line radiation in laser-produced plasmas. R.C.Elton, R.H.Dixon (Naval Res. Lab., Washington, DC, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1886-9 (Sept. 1983).
Observed depletion of resonance-line emission from heliumlike C^{4+} ions at 308-eV photon energy is associated with photoionization of lithiumlike Na^{8+} ions, as evidenced also by enhanced emission from the latter near the surface of laser-heated sodium-doped carbon targets. The data are analyzed in terms of the total density of Na^{8+} in the absorbing $n=2$ state, the photoionization cross section, and the relative population density of the radiating 3*d* excited state. 32.80H Auger effect and inner-shell ionization

106373 Probability of internal ionization during β^+ decay: importance of the direct-collision mechanism. R.L.Intemann (Dept. of Phys., Temple Univ., Philadelphia, PA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1288-92 (Sept. 1983).
A theory of the ionization of inner-shell electrons during β^+ decay is obtained by modifying a theory of inner-shell ionization during β^- decay presented previously. The theory includes the contributions of both the shakeoff and direct-collision mechanisms and yields results whose relative accuracy is of order $Z\alpha$. Numerical results for the *K*-shell ionization probability are presented for several nuclides, including ^{58}Co, ^{64}Cu, and ^{65}Zn; they demonstrate that, contrary to the β^- case, the direct-collision mechanism plays an essential role in inner-shell ionization during β^+ decay, confirming a conjecture by Law (1982). When compared with the results of recent experiments, they are found to give significantly better agreement than do the results of previous theoretical work. (23 refs.)

106374 Recalibration of the Auger spectra of boron. K.T.Chong, R.Bruch (Fakultat fur Phys., Univ. Freiburg, Freiburg, Germany).
Phys. Rev. A (USA), vol.28, no.3, p.1418-22 (Sept. 1983).
By using saddle-point technique, 12 autoionizing and two metastable autoionizing states of B III are calculated. To obtain high accuracy relativistic effects and mass polarization effect are included in the computation. Spin-orbit, spin-other-orbit, and spin-spin effects are also considered. Using the B IV $(1s^2)^1S$ result of Pekeris (1958) the corresponding Auger energies are tabulated. These data are then used to recalibrate the reported boron electron spectra of Rodbro, Bruch, and Bisgaard (1979) by about 0.15 eV. The calculated energies enable the authors to make seven new identifications in the boron Auger spectra. The fine-structure calculation also reveals many inverted *J* levels among these core-excited states. (25 refs.)

106375 Auger-electron study of correlation effects in $3d^{-1}$ and $4d^{-2}$ states of Cs in atomic Cs and molecular CsI. H.Aksela, S.Aksela (Dept. of Phys., Univ. of Oulu, Oulu, Finland).
Phys. Rev. A (USA), vol.28, no.3, p.1503-8 (Sept. 1983).
High-resolution electron-beam-excited $M_{4,5}N_{4,5}N_{4,5}$ Auger-electron spectra of Cs have been measured and analyzed both from atomic Cs and molecular CsI vapors. The observed main fine structure is reproduced fairly well with the mixed-coupling calculations based on the closed-shell approximation. Some extra structure exists, which is stronger in the spectrum of molecular CsI than in the spectrum of atomic Cs. This structure is investigated by carrying out Dirac-Fock calculations for the energies of the Auger transitions locating the outermost electron either on the 6*s*, 5*d*, or 4*f* orbital. (14 refs.)

32.80K Multiphoton processes

106376 Narrowing of two-photon resonance due to elastic collisions. V.A.Ulybin, V.P.Chebotaev (Inst. of Thermophys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.6, p.311-14 (20 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.6, p.264-6 (20 March 1983). [received: Sept. 1983]
The two-photon absorption line shape is examined in the field of a standing wave with elastic collisions. A sharp decrease is observed in the transit broadening of the two-photon resonance in vibrational-rotational transitions of molecules due to an increase in the interaction time of particles with the

electromagnetic field as a result of elastic collisions. This effect permits obtaining supernarrow optical two-photon absorption resonances with high intensity in a low-pressure gas. (6 refs.)

Multiphoton excitation and frequency tripling in xenon .... See Entry 106326

32.90 OTHER TOPICS IN ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS

106377 Scattering of 1.1732- and 1.3325-MeV gamma rays through small angles by carbon, aluminum, copper, tin, and lead. P.P.Kane, J.Mahajani, G.Basavaraju, A.K.Priyadarsini (Dept. of Phys., Indian Inst. of Technol., Bombay, India).
Phys. Rev. A (USA), vol.28, no.3, p.1509-16 (Sept. 1983).
With the help of Ge(Li) detectors, elastic and Compton scattering cross sections of copper, tin, and lead were determined in the double-shadow-cone geometry from 4.51° to 12.05° in the case of 1.1732- and 1.3325-MeV γ rays of ^{60}Co. A new method was developed for the accurate measurement of cross sections. The measured elastic scattering cross sections are determined predominantly by Rayleigh scattering from bound atomic electrons. The nuclear Thomson and the Delbruck scattering amplitudes have also been considered in the interpretation of data. The relativistic modified form-factor theory of Rayleigh scattering leads to good agreement with the data for $x<12$ Å^{-1}, where $x=\sin(\theta/2)/\lambda$, and where θ is the scattering angle and λ the photon wavelength. The measured Compton scattering cross sections for $x>4.5$ Å^{-1} are in agreement with those calculated on the basis of tabulated nonrelativistic incoherent scattering functions, although there are deviations at smaller x values. (18 refs.)

106378 Incoherent scattering at low photon energies. V.Visweswara Rao, D.Venkateswara Rao (Dept. of Phys., Indian Inst. of Technol., Kharagpur, India).
Phys. Rev. A (USA), vol.28, no.3, p.1527-30 (Sept. 1983).
Incoherent scattering functions have been experimentally determined for photon energies 84.4, 123.6, 145, and 320 keV in the angular range 30°-130° in the elements Sc, Y, La, Ce, Gd, Dy, W, Pt, and Pb with the use of the aluminum difference technique. The experimental values have been compared with those estimated on the basis of the nonrelativistic Hartree-Fock wave functions. Good agreement is observed between theory and experiment. (14 refs.)

33.00 MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS

33.10 CALCULATION OF MOLECULAR SPECTRA

106379 Influence of rigid-body motion on the deformation electron density of H_2O. K.Hermansson (Inst. of Chem., Univ. of Uppsala, Uppsala, Sweden).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.295-300 (12 Aug. 1983).
The influence of translational and librational motion on the theoretical deformation electron density of a water molecule is investigated. The translational motion dominates the thermal smearing except in the vicinity of the hydrogen atoms at low temperatures. (20 refs.)

106380 Cubic and quartic force constants of some stretching and out-of-plane bending modes of the FH...OH_2 complex: a three-dimensional hypersurface analysis. Y.Bouteiller, M.Allavena, J.M.Leclercq (Centre de Mecanique Ondulatoire Appliquee, CNRS, Paris, France).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.432-6 (19 Aug. 1983).
The potential-energy hypersurface of the FH...OH_2 complex is investigated by following the variations of three coordinates: the r_1(F-H) and r_2(H...O) bond lengths and the out-of-plane β(FHO) angle. The energy values $E(r_1,r_2,\beta)$, calculated at the SCF level are distributed in the four-dimensional space $\{E,r_1,r_2,\beta\}$ and fitted to the fourth order by an analytical surface from which a force field is deduced. The accuracy of the results and their implication for the calculation of vibrational modes are discussed. (22 refs.)

106381 Rotational analysis of the $^2B_1(K'=1)-^2A_1(K''=0)$ sub-band of NO_2 at 464-9 nm in the time-gated excitation spectrum. N.Sugimoto, N.Takeuchi (Nat. Inst. for Environmental Studies, Ibaraki, Japan), S.Takezawa.
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.475-8 (19 Aug. 1983).
The rotational structure of the $^2B_1(K'=1)$ sub-band of NO_2 was, for the first time, analyzed in the time-gated excitation spectrum monitored at the $3\nu_2$ fluorescence band. The band origin, $\nu_0=21504.9$ cm^{-1}, and rotational constant, $\bar{B}'=0.373$ cm^{-1}, were obtained. The observed sub-band was vibrationally identified to be $(\nu_2', K')=(16,1)$ with the linear notation. Also a vibrational assignment of the transitions, the rotational identification of which was reported by Senum and Schwartz (1977) is proposed. (8 refs.)

106382 Vibrational frequencies of the HCCN molecule. A near degeneracy between bent cyanocarbene and linear allene-related geometries. K.S.Kim, H.F.Schaefer,III (Dept. of Chem., Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), L.Radom, J.A.Pople, J.S.Binkley.
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4148-54 (29 June 1983).
The geometrical structure and vibrational frequencies of the ground triplet electronic state of HCCN have been examined at a wide range of levels of ab initio electronic structure theory. The potential energy surface of HCC bending is very flat for HCCN owing to a competition between linear allene HC=C=N and bent carbene H$\dot{\rm C}$C≡N valence structures. Evidence is presented that both the restricted Hartree-Fock (RHF) and unrestricted Hartree-Fock (UHF) methods treat this potential surface in a somewhat uneven manner. When the effects of electron correlation are included, however, RHF- and UHF-based methods converge to a similar set of structural and energetic predictions. The most reliable levels of theory suggest that HCCN is a quasi-linear molecule, with $\theta_e(\mathrm{HCC})\approx138°$ and a barrier to linearity of only about 2 kcal/mol. (37 refs.)

106383 Two-dimensional analysis of the ring-puckering and PH inversion vibrations of 3-phospholene. M.A.Harthcock, J.Laane (Dept. of Chem., Texas A & M Univ., College Station, TX, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2103-13 (1 Sept. 1983).
The ring-puckering energy levels for 3-phospholene $CH_2CH=CHCH_2PH$, in both the ground and excited states of the PH inversion vibration have been established from the vibrational spectra of this molecule. The availability of such extensive data made it possible to determine a reliable two-dimensional (with the ring-puckering and the P-H inversion as the two coordinates) potential energy surface. For the calculations, the kinetic energy coefficients g_{44}, g_{55}, and the cross term g_{45} was accurately represented as functions of both coordinates. An initial approximation to the asymmetric two-dimensional potential energy surface was obtained from the one-dimensional ring-puckering function as well as from structural data from microwave spectroscopy. Symmetry constraints established which potential terms were to be utilized. Three separate computer programs were written in order to calculate the vibrational energy levels and to adjust the potential parameters. The most efficient approach utilized a product of two prediagonalized basis sets for the basis functions. Initial attempts to fit the data with a potential surface using terms up through fourth power proved unsatisfactory in fitting data for the inversion excited state. A local solution based on Van Vleck perturbation theory was thus obtained and then expanded, using the symmetry constraints, to the entire solution. The resulting potential surface, which required the use of sixth power terms, gave excellent agreement with the observed spectra. Only five variable parameters were adjusted (for the local solution) in order to fit the 20 observed frequencies. The final potential surface has a central barrier of about 5500 cm^{-1} for the planar configuration. The more stable endo conformation lies 785 cm^{-1} in energy below that of the exo form with similar puckering angle (18°). (22 refs.)

106384 Calculation of the missing mode effect frequencies from Raman intensities. L.Tutt (Dept. of Chem. & Biochem., Univ. of California, Los Angeles, CA, USA), D.Tannor, J.Schindler, E.J.Heller, J.I.Zink.
J. Phys. Chem. (USA), vol.87, no.16, p.3017-19 (4 Aug. 1983).
Regularly spaced vibronic structure in the luminescence spectra of large molecules often does not correspond to any ground-state normal-mode vibration of the molecule. This 'missing mode effect' (MIME) is explained in terms of the time-dependent picture of electronic transitions. Simple equations from which the MIME frequency can be calculated are derived. The parameters which are needed to calculate the MIME frequency are independently determined by using preresonance Raman spectroscopy. Good agreement between the experimental spectrum and the spectrum calculated by using the independently determined parameters is observed. The normal modes contributing to the MIME frequency are identified and discussed. (12 refs.)

106385 Partial-sum rules for and asymmetry between rotational transitions $J\pm\Delta J\leftarrow J$. I.Shimamura (Inst. of Space & Astronautical Sci., Tokyo, Japan).
Phys. Rev. A (USA), vol.28, no.3, p.1357-62 (Sept. 1983).
The authors study a class of spectra $a(J'\leftarrow J)$ of rotational transitions of linear and spherical-top rotators. Examples are the cross sections for photoabsorption, photoionization, and collisions in the sudden approximation. Both the sum $a(J+\Delta J\leftarrow J)+a(J-\Delta J\leftarrow J)$ and the transition-energy-weighted sum $\Delta E(J+\Delta J\leftarrow J)a(J+\Delta J\leftarrow J)+\Delta E(J-\Delta J\leftarrow J)a(J-\Delta J\leftarrow J)$ are nearly indeendent of J at high J, the J-dependent correction terms being of the order of J^{-2} for linear rotators and much smaller for spherical tops. The ratio $a(J+\Delta J\leftarrow J)/a(J-\Delta J\leftarrow J)$ is $1+c\Delta J/J+O(J^{-2})$, where $c=1$ for linear rotators and $c=2$ for spherical tops. The anisotropy parameter $\beta(J'\leftarrow J)$ for the angular distribution of photoelectrons satisfies $\beta(J\pm\Delta J\leftarrow J)=\beta_\infty[1+c_\beta J^{-2}+O(J^{-3})]$, and $\beta(J+\Delta J\leftarrow J)/\beta(J-\Delta J\leftarrow J)=1+O(J^{-3})$ for linear rotators, where β_∞ and c_β are constants independent of J. The β for spherical tops show much weaker dependence on J. (24 refs.)

106386 The $B(^1\Sigma^+)$ and $X(^1\Sigma^+)$ states of HF and DF: RKR curves and Franck-Condon factors. J.M.Alvarino, L.F.Gonzalez, M.L.Hernandez, E.Martinez (Dept. de Quimica Fisica, Univ. del Pais Vasco, Bilbao, Spain).
Spectrosc. Lett. (USA), vol.16, no.7, p.541-53 (1983).
RKR turning points for the $B(^1\Sigma^+)$ and $X(^1\Sigma^+)$ states of DF have been calculated. Franck-Condon factors and r-centroids for the B-X band system of HF and DF have been evaluated and compared with previous experimental results. (23 refs.)

33.20 MOLECULAR SPECTRA GROUPED BY WAVELENGTH RANGES

(for magneto-optical and electro-optical spectra, see 33.45; for fluorescence and phosphorescence spectra, see 33.50; for photoelectron spectra, see 33.65)

106387 Resolution of an ancient spectroscopic puzzle: the D→X spectrum of I_2. J.Tellinghuisen (Dept. of Chem., Vanderbilt Univ., Nashville, TN, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.373-6 (19 Aug. 1983).
The D→X emission from low-*v* levels of the D state is discerned in the region λ<3280 Å of the emission spectrum of I_2 in Ar. Analysis of 47 bands spanning $v'=0$-3 yields the constants (in cm^{-1}), $T_e=41027.3(5)$, $\omega_e=95.0(3)$, and $\omega_e x_e \approx 0.16$. (28 refs.)

106388 $\tilde{X}^1A_1$, $\tilde{a}^3B_1$, and $\tilde{A}^1B_1$ electronic states of silyenes. Structures and vibrational frequencies of SiH_2, SiHF, and SiF_2. M.E.Colvin, R.S.Grev, H.F.Schaefer,III. (Dept. of Chem., Univ. of California, Berkeley, CA, USA), J.Bicerano.
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.399-405 (19 Aug. 1983).
The spectroscopic characteristics of the three lowest-lying electronic states of SiH_2, SiHF, and SiF_2 have been predicted via a priori quantum-mechanical methods. Where experimental results are available, the theoretical predictions usually agree well. Specially Rao's identification of the $^3B_1$ state of SiF_2 (1970) is confirmed. Also Milligan and Jacox's very tentative assignment of an absorption at 2032 cm^{-1} to ν_1 (SiH_2) (1968) is shown to be reasonable. many spectroscopic features have been predicted for which there are no experimental observations at present. (38 refs.)

106389 The electronic structure and spectra of UO^+. M.Krauss, W.J.Stevens (Molecular Spectroscopy Div., NBS, Washington, DC, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.417-21 (19 Aug. 1983).
Relativistic effective potentials are used to calculate the electronic structure and spectroscopic properties of UO^+. The lowest-energy states are very ionic and the molecular orbitals substantially localized so that the molecule is described by the ionic fragments, U^{3+} (f^3,^4I) and O^{2-} (^1S). The R_e and ω_e of the ground $\Omega=9/2$ state have been determined to be 3.48 bohr and 925 cm^{-1}. The vibrational and electronic states are interleaved with the lowest excited electronic state, $\Omega=7/2$, at 1315 cm^{-1}. The excitation energies of the excited states of UO^+ were calculated using a restricted valence configuration interaction. Strong radiative transitions are predicted in the red part of the visible. (16 refs.)

106390 Absorption and circular dichroism spectra of dimeric systems. Extended dimer model. M.Z.Zgierski (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Ontario, Canada), M.Pawlikowski.
J. Chem. Phys. (USA), vol.79, no.4, p.1616-33 (15 Aug. 1983).
An extended dimer model is formulated. It differs from the simple dimer model in allowing for mixing of monomer electronic states by intermolecular interaction. The exact and approximate mathematics treatments of the model are discussed in detail. The model is applied to studies of absorption and circular dichroism spectra of dimers. It is shown that the transfer of intensity and rotatory power due to interstate mixing leads to readily observable changes in the vibronic structure of the corresponding spectra. The model is used to reinterpret the observed CD spectra of two different 1,1′-bianthryls. (36 refs.)

106391 The photodissociation of nitromethane at 193 nm. L.J.Butler, D.Krajnovich, Y.T.Lee (Dept. of Chem., Univ. of California, Berkeley, CA, USA), G.Ondrey, R.Bersohn.
J. Chem. Phys. (USA), vol.79, no.4, p.1708-22 (15 Aug. 1983).
The dissociation of nitromethane following the excitation of the $\pi^* \leftarrow \pi$ transition at 193 nm has been investigated by two independent and complementary techniques, product emission spectroscopy and molecular beam photofragment translational energy spectroscopy. The primary process is shown to be cleavage of the C-N bond to yield CH_3 and NO_2 radicals. The translational energy distribution for this chemical process indicates that there are two distinct mechanisms by which CH_3 and NO_2 radicals are produced. The dominant mechanism releasing a relatively large fraction of the total available energy to translation probably gives NO_2 radicals in a vibrationally excited $^2B_2$ state. When dissociated, other nitroalkanes exhibit the same emission spectrum as CH_3NO_2, suggesting little transfer of energy from the excited NO_2 group to the alkyl group during dissociation for the dominant mechanism. This conclusion is supported by the apparent loss of the slow NO_2 product in the molecular beam studies to unimolecular dissociation to NO+O, which will occur for NO_2 with 72 kcal/mol or more internal energy. Evidence is presented which suggests that the NO_2 produced via the minor mechanism, which releases a smaller fraction of the available energy to translation, has a large cross section for absorbing an additional photon via a parallel transition and dissociating to NO+O. (41 refs.)

106392 Quantitative interpretation of the absorption and emission spectra of 1,8-diphenyl-1,3,5,7-octatetraene. W.H.Henneker, W.Siebrand, M.Z.Zgierski (Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
J. Chem. Phys. (USA), vol.79, no.5, p.2495-6 (1 Sept. 1983).
Recently Ikeyama and Azumi (1982) (IA) reported carefully corrected absorption and emission spectra of 1,8-diphenyl-1,3,5,7-octatetraene in octane. They interpreted the irregular intensity distributions and lack of mirror-image relationship in terms of two closely spaced states of symmetry $(2)A_g$ and $(1)B_u$ in C_{2h}. They assumed that the forbidden transition between $2A_g$ and the $1A_g$ ground state borrows intensity from the allowed transition between $1B_u$ and $1A_g$ through solvent-induced lowering of the C_{2h} symmetry. The spectra show two a_g CC-stretching progressions with intensity distributions deviating from the displaced harmonic oscillator distributions predicted by the Franck-Condon principle. According to IA, this is due to vibronic coupling between $1B_u$ and $2A_g$ through a_g modes, made possible by the lower symmetry; interference of this coupling with Franck-Condon effects produces the irregular spectra. They support these arguments with perturbation calculations, including both adiabatic and nonadiabatic vibronic coupling. The authors point out that such a two-state vibronic-coupling system can be solved much more accurately by direct diagonalization of the Hamiltonian matrix. This is equivalent to solving the perturbation problem to all orders. The procedure automatically includes both adiabatic and nonadiabatic coupling and yields a much better reproduction of the observed spectra than can be obtained from low-order perturbation treatments. (4 refs.)

106393 Photoelectric detection of absorption spectra in studies of the Shpolskii effect. T.N.Bolotnikova, V.A.Zhukov, L.F.Utkina.
J. Appl. Spectrosc. (USA), vol.37, no.5, p.1286-9 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.800-4 (Nov. 1982). [received: Sept. 1983]
The work concerns an evaluation of the possibility of quantitative measurements using the absorption spectra of frozen polycrystalline samples and a comparison of the excitation and absorption spectra obtained under identical conditions for one and the same sample, in order to determine the conditions under which these two spectra are identical. (4 refs.)

106394 Interactions between unbound groups in the molecules $\phi CX_{(1)}X_{(2)}X_{(3)}$. Influence on the secondary transition intensity. D.Denis-Courtois, B.Vidal (Lab. de Spectroscopie de la Reactivite Chimique, Univ. des Sci. et Techniques de Lille, Villeneuve d'Ascq, France).
Spectrochim. Acta Part A (GB), vol.39A, no.8, p.735-50 (1983). In French.
Spectra of the secondary transition of the benzene chromophore, acting as a molecular probe, in molecules $\phi CX_{(1)}X_{(2)}X_{(3)}$ show surprisingly that the coupling involving π_ϕ and an auxochrome, $X_{(1)}$ for example, through the bonds C_α-$X_{(2)}$ and C_α-$X_{(3)}$ has very often almost as much efficiency as a coupling through C_α-H bonds. The authors' spectroscopic results show that neither a group nor a given symmetry of the substituent is to be privileged. Thus the authors develop a model in which no symmetry condition is required. The σ, π coupling is described as a coupling between all the group of substituents on C_α acting as a whole, and π_ϕ, through two 2*p* orbitals belonging to C_α. That coupling scheme is in good agreement with all the intensities of the secondary transition measured at the 00 band of a wide range of molecules. Spectra of species involving one or several at a time of the next bonds have been studied. When two benzene chromophores are involved (C_α-C_ϕ) a through space interaction must also be taken into consideration. (43 refs.)

33.20B Radiofrequency and microwave spectra

(for NMR spectra, see 33.25; for EPR spectra, see 33.30)

106395 Millimeter and submillimeter wave spectrum of oxygen in the $a^1\Delta_g$ state. G.Cazzoli, C.Degli Esposti, P.G.Favero (Inst. di Spettroscopia Molecolare, CNR, Bologna, Italy).
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.99-101 (26 Aug. 1983).
The measurements of two rotational transitions of oxygen in the $a^1\Delta_g$ electronically excited state in the millimeter and submillimeter wave region allowed a more accurate determination of the molecular parameters of this molecule. The newly determined values in MHz are $B_0=42504.523(4)$, $D_0=0.1526(1)$; $q=7.8(55)\times10^5$. (4 refs.)

106396 Λ doubling spectrum of the CH free radical in a RF glow discharge. M.Bogey, C.Demuynck, J.L.Destombes (Lab. de Spectroscopie Hertzienne, Univ. de Lille, Villeneuve d'Ascq, France).
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.105-9 (26 Aug. 1983).
Λ doubling transitions of CH $X^2\pi$ have been observed in a RF discharge in various gas mixtures. The measured frequencies are fitted together with the astrophysical lines and with recent MODR measurements. A set of molecular parameters is derived, and the hyperfine and Λ doubling structure is carefully analyzed. The frequencies of some transitions of astrophysical interest are predicted with high accuracy. (28 refs.)

106397 The microwave spectrum of the fluoromethyl radical, CH_2F. Y.Endo, C.Yamada, S.Saito, E.Hirota (Inst. for Molecular Sci., Okazaki, Japan).
J. Chem. Phys. (USA), vol.79, no.4, p.1605-11 (15 Aug. 1983).
The microwave spectrum of the fluoromethyl radical, CH_2F, has been observed by using a source-frequency modulation spectrometer with a 1 m long free space absorption cell. The CH_2F radical was generated directly in the cell by the reaction of methyl fluoride with 2450 MHz discharge products of CF_4. The *a*-type *R*-branch transitions, $N=1\leftarrow0$, $2\leftarrow1$, and $3\leftarrow2$ for the ground vibrational state and $N=2\leftarrow1$ and $3\leftarrow2$ for the first excited state of the out-of-lane bending mode (ν_4), have been observed; all of them were found to be split into fine and hyperfine components, and individual lines were measured precisely. The hyperfine structure observed for the ground state is consistent with electronic symmetry of B_1 and with odd parity with respect to the reflection on the 'molecular plane'. A relative intensity

measurement shows that the $\nu_4=1$ state of even parity is located $300(30)cm^{-1}$ above the ground state. These observations suggest that the CH_2F molecule is essentially planar, although the presence of a small hump at the planar configuration cannot be excluded. (27 refs.)

106398 The rotational Zeeman effect in ArHBr: an interpretation of the rotational Zeeman parameters in rare gas hydrogen halide complexes. W.G.Read, E.J.Campbell (Noyes Chem. Lab., Univ. of Illinois, Urbana, IL, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1669-77 (15 Aug. 1983).
The rotational Zeeman effect in the ArHBr van der Waals molecule has been studied using the method of pulsed Fourier transform microwave spectroscopy carried out in a Fabry-Perot cavity located in the bore of a superconducting magnetic solenoid. The rotational magnetic dipole moment, magnetic susceptibility anisotropy, and bromine bulk shielding constant were determined. The values for $ArH^{79}Br$ are: $g_\perp G=0.00020(5)$, $\chi_\|$-Vc_\perp=-0.13(9)\times 10^{-9}$ MHz/G^2, and $\sigma_{Br}=4000(2000)$ ppm. The equations describing these molecular Zeeman parameters in terms of the properties of the constituent subunits of the complex are derived from the full dynamic molecular Hamiltonian. The rotational *g* value is a sensitive measure of the degree of Coriolis coupling in the complex. The molecular quadrupole moment of ArHBr is calculated. (30 refs.)

The rotational spectrum of $(H_2O)_2$ at atmospheric conditions ....See Entry 106405

33.20E Infrared spectra

106399 Diode-laser spectroscopy of supersonic free jets. Y.Mizugai (Dept. of Phys., Sophia Univ., Tokyo, Japan), H.Kuze, H.Jones, M.Takami.
Appl. Phys. B (Germany), vol.B32, no.1, p.43-7 (Sept. 1983).
A supersonic-free-jet infrared spectrometer has been constructed for investigation of molecular vibrational spectra at low rotational and vibrational temperatures. The sensitivity of measurement in a pulsed jet is increased by employing a phase-sensitive detection method synchronized with the pulsed frequency. The performance of the spectrometer is examined for the absorption lines of the NH_3 ν_2 band. A rotational temperature as low as 16K is attained when seeded in He. Cold-jet spectra are demonstrated for the ν_3 bands of PF_5, $^{34}SF_6$, and $^{182}WF_6$. (17 refs.)

106400 Infrared spectra of hydrogen-bonded salicylic acid and its derivatives: methyl salicylate. M.J.Wojcik (Faculty of Chem., Jagiellonian Univ., Cracow, Poland), C.Paluszkiewicz.
Can. J. Chem. (Canada), vol.61, no.7, p.1449-52 (July 1983).
Infrared spectra of hydrogen-bonded methyl salicylate have been studied in the temperature range 173-293K, in solutions of various concentrations (in CCl_4) and in the gaseous state. The molecules form monomeric intramolecular hydrogen bonds in the solid, liquid and gaseous state. Far-infrared spectra were recorded which give the wavenumber of low-frequency O...O mode used in theoretical reconstruction of the band connected with the O-H stretching vibration. The position and especially the width of this band are determined to a large extent by the influence of the environment. (10 refs.)

106401 Molecular complexes of cyclopropane with hydrogen halides and water studied by matrix-isolation vibrational spectroscopy. A.J.Barnes, S.L.Paulson (Dept. of Chem. & Appl. Chem., Univ. of Salford, Salford, England).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.326-30 (12 Aug. 1983).
Infrared spectra of cyclopropane-hydrogen halide and cyclopropane-water complexes show similar perturbations of the cyclopropane modes, suggesting that all have the proton donor 'hydrogen-bonded' to the ring edge. The spectrum of the cyclopropane-water complex is consistent with water forming a bifurcated hydrogen bond to the ring. (10 refs.)

106402 Fourier-transform electronic absorption spectroscopy: the 800 nm near-infrared band system of nitrosyl cyanide (NCNO). J.Pfab (Dept. of Chem., Heriot-Watt Univ., Edinburgh, Scotland).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.465-9 (19 Aug. 1983).
Dispersed and Fourier-transform spectra of NCNO vapour have been measured and some of the vibrational and coarse rotational structure has been analysed. The absorption is due to a $^1A''\leftarrow{}^1A'(n_-\pi^*)$ transition with the origin at 882.2 nm. The main geometry change accompanying the transition consists of an opening up of the CNO angle. (23 refs.)

106403 Development of a 10 cm^{-1} resolution 6.3 μm H_2O band model. L.S.Bernstein (Spectral Sci. Inc., Burlington, MA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.173-9 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
A simple model for developing band model parameters at moderate spectral resolution (~ 10 cm^{-1}) is applied to the 6.3 μm H_2O band. The underlying assumption of the approach is that the shapes of bands of the same symmetry can be superimposed to within ~ 10 cm^{-1}. The band centers of the hot bands for H_2O in the 6.3 μm are known, and the reference bandshapes can be generated from the AFGL HITRAN line atlas. A preliminary set of band model parameters is presented and compared to the NASA parameters. (11 refs.)

106404 Vibrational infrared spectra of the titanium subchlorides. T.C.DeVore, T.N.Gallaher (Dept. of Chem., James Madison Univ., Harrisonburg, VA, USA).
High Temp. Sci. (USA), vol.16, no.2, p.83-8 (April 1983). [received: Sept. 1983]
The infrared spectra of gaseous $TiCl_4$, $TiCl_3$, $TiCl_2$, and, possibly TiCl have been investigated using a microwave discharge through a $TiCl_4$/Ar mixture as the molecular source. The vibrational frequencies found for $TiCl_3$ and $TiCl_2$ are 497 cm^{-1} and 489 cm^{-1}, respectively. In addition, three weak bands were observed at 450 cm^{-1}, 400 cm^{-1}, and 422 cm^{-1}, that have tentatively been assigned as arising from the $X^4\Sigma^-$, the $X'^2\Delta$, and either the $A'^2\Sigma^+$ or the $A'^2\Gamma$ states of TiCl, respectively. (11 refs.)

106405 The rotational spectrum of $(H_2O)_2$ at atmospheric conditions. A.A.Vigasin, G.V.Chlenova.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.7, p.703-8 (July 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
On the basis of published data on the molecular parameters of the water dimer the behaviour of the rotational spectrum in the region 0-100 cm^{-1} is calculated. The characteristics of the temperature alterations of integrated intensity distribution are revealed. From comparison with available experimental data, the molar part of the water dimer under atmospheric conditions is estimated. (19 refs.)

106406 Resonance Raman spectra of the ground and excited states of specifically deuterated tris(2,2′-bipyridine)ruthenium(II). S.McClanahan, T.Hayes, J.Kincaid (Chem. Dept., Univ. of Kentucky, Lexington, KY, USA).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4486-7 (29 June 1983).
The authors report the resonance Raman (rR) spectra of a specifically deuterated analogue of the title complex in both its ground and lowest electronic excited states. The sensitivity of vibrational frequencies to deuterium substitution permits a more reliable correlation of ground- and excited-state frequencies and provides insight into the nature of the vibrational modes in each state. (9 refs.)

106407 On the vibrational frequency correlation in liquids: Raman study of aqueous thiocyanate solutions. T.Kato (Seibo Womens's Jr. Coll., Kyoto, Japan).
J. Chem. Phys. (USA), vol.79, no.5, p.2139-44 (1 Sept. 1983).
The vibrational frequency correlation functions $\langle\omega(0)\omega(t)\rangle$ are calculated from isotropic Raman spectra for the CN stretching mode of the SCN^- anion in aqueous LiSCN, NaSCN, and KSCN solutions, at concentrations 1-10 M, and at temperatures of 30, 55, and 80° C. The experimental $\langle\omega(0)\omega(t)\rangle$ shows rapid relaxations within a particular environment on a subpicosecond time scale, accompanied by constant positive correlation. It is concluded that the homogeneous dephasing is due to the fast relaxation of $\langle\omega(0)\omega(t)\rangle$, and that the inhomogeneous dephasing comes from the static positive correlation, which should be attributed to a distribution of environments persisting over the time scale of Raman probe. The analysis of $\langle\omega(0)\omega(t)\rangle$ confirms that the inhomogeneous broadening increases with decreasing temperature, with increasing salt concentration, and in the order KSCN<NaSCN<LiSCN. (16 refs.)

106408 FTIR observation of the N_2...HF complex in solid argon. L.Andrews, B.J.Kelsall, R.T.Arlinghaus (Dept. of Chem., Univ. of Virginia, Charlottesville, VA, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2488-90 (1 Sept. 1983).
During a series of matrix isolation studies of base-HF complexes, spectra of $(HF)_2$ and $(HF)_3$ were observed in solid argon. Matrix samples containing HF were doped with N_2 to check for a possible impurity N_2...HF complex, and strong sharp absorptions at 3881.5 and 262 cm^{-1} were related to N_2 present in the matrix. The linear N_2...HF complex recently characterized by pulsed-nozzle microwave studies, has a weaker N≡N...H-F hydrogen bond than the isoelectronic OC...HF and HCN...HF species. The vibrational spectrum of N_2...HF in solid argon provides complementary spectroscopic information. (19 refs.)

106409 Vibrational analysis of acetate ion molecules and estimation of equilibrium constants for their hydrogen isotopic exchange reactions. M.Kakihana, M.Kotaka, M.Okamoto (Res. Lab. for Nuclear Reactors, Tokyo Inst. of Technol., Tokyo, Japan).
J. Phys. Chem. (USA), vol.87, no.14, p.2526-35 (7 July 1983).
The infrared spectra (4000-300 cm^{-1}) of CH_3COONa and its five isotopic substitutions including D- and ^{13}C-labeled modifications suspended in KBr disks were measured at 80 and 290K. Complete vibrational assignments were established on the basis of correlations of group modes and the ^{13}C shifts of the fundamentals. From a normal coordinate analysis a general valence force field involving 26 force constants has been determined, which reproduces 82 experimental frequencies with a root-mean-squares deviation of 3.3 cm^{-1}. The composition of the normal vibrations from the symmetry coordinates has been given in terms of the potential energy distribution which makes it possible to inspect the relation between the normal modes and the group vibrations. Calculated equilibrium constants of some hydrogen isotopic exchange reactions between the acetate ion molecules are reported. (20 refs.)

106410 Infrared spectra of the *n*-butyl and *n*-pentyl radicals. J.Pacansky, A.Gutierrez (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Chem. (USA), vol.87, no.16, p.3074-9 (4 Aug. 1983).
The *n*-butyl ($CH_3CH_2CH_2\dot{C}H_2$), *n*-butyl-1,1-d_2 ($CH_3CH_2CH_3\dot{C}D_2$), *n*-pentyl ($CH_3CH_2CH_2CH_2\dot{C}H_2$), and *n*-pentyl-1,1-$d_2$ ($CH_3CH_2CH_2CH_2\dot{C}D_2$) radicals have been generated in argon matrices by UV irradiation of the corresponding diacyl peroxides. The infrared spectra of the radicals reveal that the vibrational modes may be separated into two parts: the first consists of a number of modes characteristic for the primary radical center; the second consists of those vibrations of the nonradical portion of the chain which appear to be similar to those found for closed-shell hydrocarbons. (8 refs.)

106411 Infrared spectra of matrix-isolated metal complexes of octaethylporphine. J.R.Kincaid (Chem. Dept., Univ. of Kentucky, Lexington, KY, USA), M.W.Urban, T.Watanabe, K.Nakamoto.
J. Phys. Chem. (USA), vol.87, no.16, p.3096-101 (4 Aug. 1983).
High-resolution infrared spectra of divalent metal (Mn, Fe, Co, Ni, Cu, Zn) complexes of octaethylporphine (OEP) obtained at ~15K in argon matrices or as thin films are reported. The spectra of Ni(OEP) and a number of its isotopically substituted analogues are reported, including those of the meso-deuterated and ^{15}N substituted as well as that of the doubly labeled ^{15}N, meso-deuterated species. A thorough discussion of all observed bands is presented. Justification for selection of fundamental modes is given and sensitivity to metal substitution is discussed in terms of structural and bonding alterations. (23 refs.)

106412 Far infrared absorption in normal H_2 from 77 to 298K. P.Dore, L.Nencini (Istituto di Fisica 'G Marconi', Univ. di Roma, Roma, Italy), G.Birnbaum.
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.3, p.245-53 (Sept. 1983).
The translational-rotational absorption spectrum of normal H_2 has been measured from 80 to 900 cm^{-1} at seven temperatures from 77.4 to 298K. These results have been accurately fitted by a three-parameter line-shape function, thereby providing a reliable way of predicting the absorption of H_2 anywhere in this frequency and temperature region. (13 refs.)

106413 Influence of nature of solvent on IR and NMR spectra of ethyl cyanoacetate and formaldehyde. R.G.Makitra, T.A.Protsailo, I.E.Boldeskul, Z.Z.Rozhkova.
J. Appl. Spectrosc. (USA), vol.37, no.5, p.1272-7 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.784-90 (Nov. 1982). [received: Sept. 1983]
The condensation of cyanoacetic acid ester with formaldehyde, which is a particular case of the Knoevenagel reaction, has recently acquired great practical importance as an initial stage of the industrial preparation of cyanoacrylate adhesives. However, the mechanism of this reaction has been insufficiently investigated, and the spectroscopic identification of the active methylene group of cyanoacetates has therefore become increasingly interesting. The authors used IR and NMR spectroscopy to study the character of the influence of the nature of solvents and also of catalysts of the reaction, i.e. organic bases, on the initial reagents of the condensation reaction, so that it is possible to draw definite conclusions on the proposed mechanism of reaction of cyanoacetates with formaldehyde, and also on the selection of optimal solvents for this reaction. (11 refs.)

106414 Infrared absorption spectroscopy of phosphorescing molecules: naphthalene-d_0. K.Nishikida, Y.Kamura, K.Seki, N.Iwasaki, M.Kinoshita (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
Mol. Phys. (GB), vol.49, no.6, p.1505-7 (20 Aug. 1983).
Infrared absorption spectroscopy has recently been applied successfully to the observation of some vibrations of molecules in their phosphorescent triplet state. Clarke et al. (1973) succeeded in discerning a single new peak at 535 cm^{-1} in phosphorescent naphthalene-d_8. More recently, Mitchell et al. (1979, 1981) have observed several absorption peaks in systems containing acridine and phenazine using an argon ion laser as an excitation source. Baiardo et al. (1982) have also succeeded in observing three new peaks in phosphorescent triphenylene using an FT-IR spectrometer. The authors describe their preliminary results, obtained on naphthalene-d_0 in viscous polyethylene of molecular weight of about 2000. (8 refs.)

106415 Influence of the immediate surroundings of solute molecules on their absorption spectra. N.B.Baranova, L.V.Levshin, M.G.Reva, B.D.Ryzhikov (Dept. of General Phys., Phys. Faculty, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.7-11 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.8-12 (1982).
The reasons for the deformation of the absorption spectra of dye molecules with change in their immediate surroundings by the introduction of other molecules—in particular, surfactant molecules—into their solvate shells is considered. It is shown that these changes may be explained on the basis of the idea of the development of the hypochromic effect in dispersional interactions and of the shift in the system of electronic-vibrational levels under the influence of the field of closely spaced molecules. (12 refs.)

106416 Identification of forbidden transitions in the ν_4 band of $^{14}NH_3$ by intracavity laser-Stark spectroscopy. W.H.Weber (Ford Motor Corp., Dearborn, MI, USA), E.A.Cohen.
Opt. Lett. (USA), vol.8, no.9, p.488-90 (Sept. 1983).
Numerous perturbation-allowed transitions in the 6-μm ν_4 NH_3 band are assigned by laser-Stark spectroscopy. The transitions are forbidden in the sense that they follow the rules $\Delta K=\pm 2$, $a \rightleftharpoons s$, in contrast to the allowed transitions in ν_4, which follow the rules $\Delta K=\pm 1$, $a \rightleftharpoons a$, $s \rightleftharpoons s$. These lines indicate the presence of a significant perturbation, which should be included in the analysis of ν_4 and which, through combination relations with allowed transitions, will provide a basis for precisely determining K-dependent energy intervals in NH_3. (14 refs.)

106417 Infrared laser spectroscopy of free radicals and ions. I. The fundamental band of $NF(X^3\Sigma^-)$. P.B.Davies, W.J.Rothwell (Dept. of Phys. Chem., Univ. of Cambridge, Cambridge, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1796, p.205-12 (8 Sept. 1983).
The fundamental absorption band of the NF free radical in its $^3\Sigma^-$ ground state has been measured using a tunable diode laser spectrometer. The positions of fifty-one transitions in both P and R branches were accurately calibrated against reference gas lines. Analysis of the spectrum yields a value for the band centre of 1123.2788(30) cm^{-1} and equilibrium rotational parameters: B_e 1.205679(160) cm^{-1}; α_e 0.014889(160) cm^{-1}; D_e $5.6(8)\times 10^{-6}$ cm^{-1}. (27 refs.)

106418 The emission spectrum of PtO between 3800 Å and 8900 Å. U.Sassenberg, R.Scullman (Inst. of Phys., Univ. of Stockholm, Stockholm, Sweden).
Phys. Scr. (Sweden), vol.28, no.2, p.139-59 (Aug. 1983).
The emission spectrum of PtO has been studied between 3800 Å and 8900 Å. In addition to the earlier reported A-X and D-X transitions several new transitions have been analysed. Most of them have either the X state or another state called the x state as their lower state. The X state has the character of a O^+ state, the x state has the character of a 1 state in Hund's coupling case c which together correspond to a $^3\Sigma^-$ state. The X state together with the x state seem to constitute the ground state of PtO. (11 refs.)

106419 Substituent effects in infrared spectroscopy. IX. Intensity of the carbonyl stretching vibration in 4-substituted camphors. C.Laurence, M.Berthelot (Lab. de Spectrochimie Moleculaire, Univ. de Nantes, Nantes, France), D.G.Morris.
Spectrochim. Acta Part A (GB), vol.39A, no.8, p.699-701 (1983).
For pt.VIII see ibid., vol.38A, p.487 (1982). The frequencies ν(CO) and integrated intensities A(CO) of the carbonyl stretching vibrations have been measured in a series of 4-substituted camphors (1)-(11). Whereas ν(CO) is linearly correlated with the inductive substituent constant. A(CO) is insensitive to substitution (except in 4-NO_2 camphor). This demonstrates unambiguously the insensitivity of carbonyl intensities to σ- and field inductive effects and explains the inductive part of the DSP equation applied to ring substituted aromatic carbonyl compounds by a π-inductive effect. (9 refs.)

106420 Substituent effect in infrared spectroscopy. X. 5-substituted acetyl-2-thiophenes. M.Helbert, M.Berthelot, C.Laurence (Lab. de Spectrochimie Moleculaire, Univ. de Nantes, Nantes, France), D.Spinelli, G.Consiglio, C.Arnone.
Spectrochim. Acta Part A (GB), vol.39A, no.8, p.703-7 (1983). In French.
For pt.IX see ibid., vol.39A, no.8, p.699-701 (1983). The shoulders and/or splittings of the carbonyl band of 5-substituted 2-acetyl thiophenes (1-13) are interpreted as a Fermi resonance by means of the solvent variation method. The unperturbed carbonyl frequencies are calculated by the intensity method and checked by correlation analysis of solvent and substituent effects. The acetyl group is more sensitive to substituent effects in acetylthiophenes than in acetylbenzenes, as shown by infrared spectroscopy and by chemical reactivity. (20 refs.)

106421 Effects of neutral and anionic substituents on the carbonyl stretching bands of substituted methylbenzoates. P.J.Vassileva, I.G.Binev, I.N.Juchnovski (Inst. of Organic Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria).
Spectrochim. Acta Part A (GB), vol.39A, no.8, p.709-12 (1983).
Effects of neutral and anionic substituents on frequencies (ν_{CO}) and integrated intensities (A_{CO}) of the carbonyl stretching bands of substituted methylbenzoates (solvent dimethyl sulphoxide) have been studied in relation to Hammett's equation: satisfactory correlations have been found between ν_{CO} and σ^+ constants, as well as by using the dual-parameter equations to Yukawa, Tsuno and Taft; A_{CO} have been found to increase in cases of strong electron-releasing substituents. It has been found that constants of anionic substituents, determined on the basis of nitrile i.r. frequencies and intensities, reflect satisfactorily the effects of these substituents on ν_{CO} and A_{CO} of methylbenzoates. (13 refs.)

106422 High resolution infrared studies of site structure and dynamics for matrix isolated molecules. B.I.Swanson, L.H.Jones (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
In book: *Vibrational spectra and structure. A series of advances. Vol.12*, J.R.Durig [Ed.], p.1-67. Amsterdam, Netherlands: Elsevier (1983), xvi+497 pp. [0 444 42197 1]
The authors present results on matrix-isolated molecules using an FTIR spectrometer. Vibrational and relaxation studies are made using time-resolved absorption and emission measurements. (92 refs.)

33.20F Raman and Rayleigh spectra

(inc. scattering)

106423 Raman spectra of matrix-isolated group IIIA dimers: Ga_2, In_2, Tl_2. F.W.Froben (Inst. fur Molekulphys., Freien Univ. Berlin, Berlin, Germany), W.Schulze, U.Kloss.
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.500-2 (19 Aug. 1983).
Raman spectra of Ga, In and Tl molecules are measured in Ar and Kr matrices. Resonance progressions allow the authors to assign the ground-state vibrational frequencies and anharmonicities: Ga_2 ($\omega_e''=180$ cm^{-1}, $\omega_e x_e''=1$ cm^{-1}), In_2 ($\omega_e''=118$ cm^{-1}, $\omega_e x_e''=0.8$ cm^{-1}), Tl_2 ($\omega_e''=80$ cm^{-1}, $\omega_e x_e''=0.5$ cm^{-1}) in Ar. The dissociation energies of In_2 and Tl_2 are corrected to 20 kcal/mol. and 10 kcal/mol.±10% respectively. (8 refs.)

106424 Observation of transient resonance Raman spectra of the S_1 state of trans-stilbene. H.Hamaguchi, C.Kato, M.Tasumi (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan).
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.3-7 (26 Aug. 1983).
Transient resonance Raman spectra of trans-stilbene in *n*-hexane have been obtained using two pulsed lasers at 266 and 585 nm. The former was used to pump the molecule to the first excited singlet state (S_1) and the latter to probe spontaneous Raman scattering in resonance with the $S_n \leftarrow S_1$ electronic transition. The dependence of the pump and probe laser power, the temporal behaviour, and the excitation profile of the spectra clearly indicate that they are due to the S_1 state of trans-stilbene. (13 refs.)

106425 Revised analysis of the structure of the ν_1 band of methane. H.Frunder, D.Illig, H.Finsterholzl (Sektion Phys., Ludwig Maximilians Univ., Munich, Germany), H.W.Schrotter, B.Lavorel, G.Roussel, J.C.Hilico, J.P.Champion, G.Pierre, G.Poussigue, E.Pascaud.
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.110-14 (26 Aug. 1983).
The CARS spectrum of the ν_1 band of $^{12}CH_4$ at a pressure of 14 mbar was recorded using CW excitation in the cavity of a ring argon ion laser. The analysis of the intensity profile of the observed spectrum led to the detection of inconsistencies with the hitherto proposed calculated positions of transitions with $J=7$ to $J=10$ and to a relocation of the corresponding lines. (26 refs.)

106426 Rotational Raman spectra of a nearly symmetric rotor. M.Nardone (Istituto di Fisica, Univ. di Camerino, Macerata, Italy), M.A.Ricci.
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.1119-37 (July-Aug. 1983).
Rotational Raman spectra for an accidentally or nearly symmetric rotor are discussed in detail. The spectral-moment theory is used to yield expressions for the polarizability invariants and for the different orientational correlation times involved. A generalization of Gordon's J-diffusion is presented which is able to reproduce also spectra in which the quantization of the rotational states is still present. A further generalization of the model is suggested to account for the molecular anisotropy during the collision process. (31 refs.)

106427 Picosecond transient Raman spectroscopy: the photoisomerization of trans-stilbene. T.L.Gustafson, D.M.Roberts, D.A.Chernoff (Standard Oil Co., Corp Res. Center, Warrensville Heights, OH, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1559-64 (15 Aug. 1983).
The authors measured picosecond transient resonance Raman spectra of t-stilbene in hexane using a high repetition rate, amplified, synchronously pumped dye laser. They assign four vibrational frequencies to the olefinic moiety. Two of these frequencies, 1238 and 1565 cm^{-1}, have broad, asymmetric bands. They attribute this band shape to a distribution of excited state molecular conformers having different single and double bond strengths. (23 refs.)

106428 Theoretical interpretation of the resonance Raman spectrum of gaseous chlorine. F.Ghandour, M.Jacon (Lab. de Recherches Optiques, Univ. de Reims, Reims, France), E.N.Svendsen, J.Oddershede.
J. Chem. Phys. (USA), vol.79, no.5, p.2150-6 (1 Sept. 1983).
A theoretical calculation of the Raman band profiles of gaseous chlorine excited by a 3638 Å line is performed. The resonance part of the Raman amplitude is calculated within a semiclassical approach and the nonresonant part by an ab initio calculation. The profiles of the overtones are well described by considering only the resonant scattering via the excited electronic state $C^1\Pi(1u)$ and the anomalous value of the fundamental band intensity compared to the first overtone is shown to be due to virtual transitions to higher electronic states (normal Raman effect). (17 refs.)

106429 Effects of pressure on conformer equilibria in liquid n-hexane. P.T.T.Wong, H.H.Mantsch (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Ontario, Canada), R.G.Snyder.
J. Chem. Phys. (USA), vol.79, no.5, p.2369-74 (1 Sept. 1983).
From a study of the dependence of the polarized Raman spectra of liquid n-hexane (30°C) on pressure (0.26-7.38 kbar), the authors have confirmed the findings of Schoen et al. [Nature 270, 412, 1977] that pressure is effec-

tive in perturbing the distribution of conformers. However, their results on the behavior of the gauche forms differ from these authors. They find that increased pressure decreases the concentration of the ttt conformer and increases the concentrations of both the single- and double-gauche forms. Surprisingly, the pressure dependence of the single- and double-gauche conformers is nearly the same. Thus while the volume change for ttt→gtt is found to be about -1.1 ± 0.0 cm^3/mol, that for the single-gauche to double-gauche conversion is about 0.0 ± 0.0 cm^3/mol. These results appear to rule out a simple additivity model for the n-alkanes in which CC bonds respond independently to pressure. Their measurements also suggest that the concentration of the all-trans conformer in liquid n-hexane is significantly higher than the value obtained from the rotational-isomeric-state model with E_g and $E_{gg'}$ equal to the widely used values of 500 and 3000 cal/mol. (16 refs.)

106430 Rotational R-branch Raman spectroscopy in CO_2 (comment and reply). K.Altmann, W.Klocker, G.Strey, H.Finsterholzl, H.W.Schrotter (Sektion Phys., Ludwig Maximilian's Univ., Munchen, Germany), H.P.Godfried, L.F.Silvera.
J. Chem. Phys. (USA), vol.79, no.5, p.2490 (1 Sept. 1983).
Godfried and Silvera's Raman intensity measurements in the R branch of the pure rotational spectrum of vibrationally excited CO_2 molecules in a supersonic molecular beam (ibid., vol.78, no.1, p.121, 1983) are discussed. Altmann et al. point out that these R-branch lines have already been observed, in static samples, by Barrett and Weber (1970) and Wang (1975). They also site earlier work by Altmann, Klockner, and Strey (1976) and by Finsterholzl (1982). Godfried and Silvera reply, stating that they did not claim the first observation of the R-branch lines. They did refer to the work of Barrett and Weber and Wong, although they were not aware of the work of Altmann et al. They did claim to have fully resolved the R-branch transitions for the first time. They point out that their work revealed the existence of overlapping spectra due to national abundance isotopes ^{17}O and ^{18}O in CO_2, and other new information. (10 refs.)

106431 Unusual coordination and metal-ligand geometry of a vanadyl porphyrin in aqueous solution. J.A.Shelnutt, M.M.Dobry (Div. of Chem., Phys. of Organic Materials, Sandia Nat. Labs., Albuquerque, NM, USA).
J. Phys. Chem. (USA), vol.87, no.16, p.3012-15 (4 Aug. 1983).
Vanadyl uroporphyrin I in aqueous alkaline solution has considerably modified absorption and resonance Raman spectra when compared with vanadyl porphyrins in organic solvents or in the crystalline state. Under these latter conditions vanadyl porphyrins are known contain 5-coordinate, out-of-plane vanadium(IV). The unusual spectra of vanadyl uroporphyrin in water can be converted to spectra typical of the 5-coordinate vanadyl porphyrins by formation of π-π complexes or by π-π dimerization. Because π-π complex formation and dimerization block addition of an axial sixth ligand a 6-coordinate, in-plane dihydroxide vanadium(IV) uroporphyrin complex is indicated. This hypothesis is consistent with an analysis of the frequencies of the core-size marker lines of metalloporphyrins indicating expansion of the metal core by 0.03-0.04 Å in $V(OH)_2$UroP. (23 refs.)

106432 Resonance Raman investigation of the π^* antibonding distribution in excited triplet aqueous *p*-benzoquinone. R.Rossetti, S.M.Beck, L.E.Brus (Bell Labs., Murray Hill, NJ, USA).
J. Phys. Chem. (USA), vol.87, no.16, p.3058-61 (4 Aug. 1983).
The time-resolved resonance Raman spectra of triplet *p*-benzoquinone in water have been investigated at 266, 315, 355, and 416 nm. Recent improvements in the apparatus are described. The C=C ring stretch (Wilson's 8a) and the symmetric C=O stretch are tentatively identified, using the isotopic shift for ring deuteration and comparison with the semiquinone radical anion. The symmetric carbonyl stretch at 1496 cm^{-1} is unusually high for an n-π^* excited state. The C=C ring stretch at 1552 cm^{-1} is unusually low for a quinoid type species. These results indicate that there is π^* antibonding density on the ring as well as on the carbonyl groups. Comparison is made with previous $S_0 \rightarrow T_1$ vibronic electronic absorption studies in neon matrices. (18 refs.)

106433 Spectroscopic and theoretical studies of binuclear molybdenum(II) carboxylates. M.C.Manning, G.F.Holland, D.E.Ellis, W.C.Trogler (Dept. of Chem., Northwestern Univ., Evanston, IL, USA).
J. Phys. Chem. (USA), vol.87, no.16, p.3083-8 (4 Aug. 1983).
Electronic absorption spectra of $Mo_2(O_2CCF_3)_4$ and $Mo_2(O_2CH)_4$ have been measured at 10K in inert matrices. Results are compared with previous studies of $Mo_2(O_2CCH_3)_4$. Raman spectra of the three carboxylate complexes have been measured and assigned. Unlike $Mo_2Cl_8{}^{4-}$ or $Re_2Cl_8{}^{2-}$ resonance enhancement of the metal-metal stretch did not occur when the lowest energy absorption band was irradiated; preresonance enhancement of a carboxylate stretching vibration did occur. Certain aspects of the SCF-Xα-DV calculations for $Mo_2(O_2CH)_4$ agree better with previous HF calculations than with SCF-Xα-SW results. The sensitivity of the π-π^* separation to metal-metal distance may explain these differences. Energies of both the singlet and triplet $\delta \rightarrow \delta^*$, $\delta \rightarrow \pi^*$, $\sigma \rightarrow \delta^*$, and $\delta \rightarrow \pi^*$ (OCO) transitions have been calculated and compared with the optical spectra. (41 refs.)

106434 Time-resolved resonance Raman observation of tetrafluoro-*p*-benzosemiquinone anion radical. G.N.R.Tripathi, R.H.Schuler (Dept. of Chem., Univ. of Notre Dame, Notre Dame, IN, USA).
J. Phys. Chem. (USA), vol.87, no.16, p.3101-5 (4 Aug. 1983).
Time-resolved resonance Raman spectroscopy has been used to examine tetrafluoro-*p*-benzosemiquinone radical anion produced in the pulse radiolytic oxidation of tetrafluorohydroquinone in aqueous solution. This radical is much more reactive than *p*-benzosemiquinone and is observed to decay on the millisecond time scale in both Raman and pulse radiolytic experiments. For the Raman experiments excitation was on the red edge of the moderately strong absorption band of this radical at 430 nm. Two resonance-enhanced Raman bands are exhibited at 1556 and 1677 cm^{-1} and are assigned to the in-phase CO and symmetrical CC stretch vibrations. These frequencies are considerably higher than the corresponding values of 1435 and 1620 cm^{-1} observed in this radical's protonated counterpart. The relatively large increase in the CO stretch frequency, in particular, indicates that fluorination induces a substantial increase in the quinoid character of this radical. (12 refs.)

106435 Raman study of CF_4 in liquid Ar: molecular motions and transition dipole interaction. P.Nectoux, M.Drifford, L.Belloni, A.Vinit (Dept. de Phys. Chimie, CENS, Gif-sur-Yvette, France).
Mol. Phys. (GB), vol.49, no.6, p.1375-84 (20 Aug. 1983).
The rotational behaviour of CF_4 dissolved in liquid argon is derived from the band contour analysis of Raman spectra recorded over the concentration range from 10^{-2} mole fraction to 1 mole fraction at 85K. The angular momentum correlation times have been determined with the help of the *J*-diffusion model and used to apply the rough hard sphere model. A study of the transition dipole-transition dipole (TD-TD) interaction is made using the ν_3 mode at 85K for different concentrations. (23 refs.)

106436 High vibrational overtones in $SiHCl_3$ and SiH_2Cl_2. R.A.Bernheim, F.W.Lampe, J.f.O'Keefe (Dept. of Chem., Pennsylvania State Univ., University Park, PA, USA), J.R.Qualey,III.
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.45-50 (26 Aug. 1983).
Absorption spectra in the 12000-18000 cm^{-1} range has been recorded for gaseous $SiHCl_3$ and SiH_2Cl_2 using intracavity photoacoustic detection and CW dye lasers. The observed transitions correspond to the $\Delta v = 6$, 7, 8 and 9 overtones of the Si-H stretch and are adequately interpreted in terms of a local mode description of the vibration. (31 refs.)

106437 Low excitation energy band of 4-hydroxyazobenzene derivatives. M.R.Mahmoud, S.A.Ibrahim, M.A.Hamed (Chem. Dept., Faculty of Sci., Assiut Univ., Assiut, Egypt).
Spectrochim. Acta Part A (GB), vol.39A, no.8, p.729-33 (1983).
The low excitation energy band appeared in the electronic spectra of some 4-hydroxyazobenzene derivatives is assigned to an electronic transition of the type *n*-π^*. It is concluded that 4-hydroxyazobenzene derivatives exist mainly in the true azo form. On the other hand, the visible spectra of the azo compound; 4-hydroxy-2-carboxyazobenzene is interpreted on the basis that this compound exists in a tautomeric equilibrium of the type azo⇄hydrazone, originating from the carboxyl group at the ortho position to the azo one. 106438 Electric field effects on the absorption spectra of H_2 near the ionization limit. J.W.Copper, E.B.Saloman, B.E.Cole, Shardanand (NBS, Washington, DC, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1832-4 (Sept. 1983).
The absorption cross section of H_2 has been measured in the region between 77.5 and 82.4 nm and the effects of electric fields up to 20 kV/cm on the cross sections have been investigated. The apparent cross section is found to be increased in the neighborhood of optically allowed transitions to $np\sigma\,^1\Sigma_u{}^+$ and $np\pi\,^1\Pi_u$ states with $n = 4$-7. This increase in absorption is attributed to field mixing with nearby optically forbidden states. (5 refs.)

106439 The spectra of $^{74}Ge^{16}O$ and $^{74}Ge^{18}O$ in the vacuum ultraviolet region. O.Appelblad, S.Fredin, A.Lagerqvist (Inst. of Phys., Univ. of Stockholm, Stockholm, Sweden), F.Alberti.
Phys. Scr. (Sweden), vol.28, no.2, p.160-70 (Aug. 1983).
Five band systems of the absorption spectra of the two isotopic molecules $^{74}Ge^{16}O$ and $^{74}Ge^{18}O$ in the vacuum ultraviolet region have been rotationally and vibrationally analyzed. A number of perturbations have been observed and from one of these, rotational constants for the perturbing state have been derived. Molecular constants of the upper states are given. (14 refs.)

33.25 NUCLEAR MAGNETIC RESONANCE AND RELAXATION; NUCLEAR QUADRUPOLE RESONANCE (NQR)

106440 Dynamic stereochemistry of 2,3,12,13-tetrathia- and -tetraselena[4,4]metacyclophanes. K.R.Dixon, R.H.Mitchell (Dept. of Chem., Univ. of Victoria, Victoria, BC, Canada).
Can. J. Chem. (Canada), vol.61, no.7, p.1598-602 (July 1983).
2,3,12,13-tetrathia- and -tetraselena[4,4]metacyclophanes exhibit temperature dependent ^{1}H NMR spectra in which the methylene resonances change from AB spectra in the low temperature limit to singlets at higher temperatures. Coalescence temperatures are 256 and 208K, respectively, and a complete line-shape analysis yields $\Delta G_{298}{}^{0\neq}$ (thia)=53.2 kJ mol^{-1} and $\Delta G_{298}{}^{0\neq}$ (selena)=46.5 kJ mol^{-1}. The spectra and thermodynamic data are interpreted in terms of a mechanism involving interconversion of *syn* conformers with little or no involvement of the *anti* conformers previously assumed to dominate in this type of molecule. (23 refs.)

106441 ^{13}C NMR of stable imidazoline nitroxides. I.A.Grigor'ev, L.B.Volodarsky (Inst. of Organic Chem., Novosibirsk, USSR), A.Z.Gogolev, R.Z.Sagdeev.
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.19-23 (26 Aug. 1983).
^{13}C NMR spectra of the 15 stable imidazoline nitroxides have been studied. It has been shown that introduction of the N-oxide oxygen atom to the 3 position is most favourable for penetration of the spin density to the C=N group of the imidazoline cycle, and for its effective migration about the conjugated π-system at long distances. (8 refs.)

106442 The interaction of lanthanide shift reagents with cationic sites: a ^{1}H and ^{13}C NMR study of the solution geometry of nicotine N-methiodide. R.L.Bassfield (Philip Morris USA Res. Center, Richmond, VA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4168-72 (29 June 1983).
The use of lanthanide shift reagents as proton and carbon-13 NMR shift and relaxation probes has enabled the determination of the solution geometry of the nicotine *N*-methiodide complex. A series of experiments were performed to illustrate the applicability of induced shift and T_1 relaxation data derived from the interaction between Ln(fod)$_3$ and a quaternary ammonium salt. The results indicate that the lanthanide/anion moiety complexes with quaternary salts via the positively charged center and adheres principally to the pseudocontact model. (28 refs.)

106443 Experimental and theoretical studies of ^{13}C-^{13}C coupling constants. I. Conformational and substituent dependencies of long range coupling constants ^{4}J(^{13}C-^{13}C). S.R.Walter (Dept. of Chem., Univ. of Arizona, Tucson, AZ, USA), J.L.Marshall, C.R.McDaniel,Jr., E.D.Canada,Jr., M.Barfield.
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4185-90 (29 June 1983).
The series of ^{13}C-labeled 1- and 2-substituted adamantanes and 2-substituted bornanes were synthesized, and their ^{13}C NMR parameters were accurately measured. Of particular interest are the long range intercarbon coupling constants over four saturated bonds $^4J(^{13}\text{C-C-C-C-}^{13}\text{C})$. Depending on conformational and substituent factors, these coupling constants have magnitudes ranging from 0.1 to 0.73 Hz in the compounds investigated. Because of their relatively small values, the *J*-resolved technique of two-dimensional Fourier transform NMR was important for many of the measurements. In contrast to interproton coupling constants over four saturated bonds, $^4J_{HH'}$, the maximum values of $^4J_{CC'}$ are obtained in those conformations in which the coupled atoms are in closest proximity, rather than in the all-trans arrangements for which the $^4J_{CC'}$ are 0.3-0.6 Hz. Calculated results for the Fermi contact contributions to $^4J_{CC'}$, which were based on the INDO-FPT molecular orbital method, are in exceedingly good agreement with the experimental values. As a consequence, it appears that the computational methods improve as the coupled atoms are further separated, and that the long range coupling constants will be useful for spectral assignments. (44 refs.)

106444 Experimental and theoretical studies of ^{13}C-^{13}C coupling constants. II. Conformational and substituent dependencies of geminal coupling constants ^{2}J(^{13}C-^{13}C). M.Barfield, S.R.Walter (Dept. of Chem., Univ. of Arizona, Tucson, AZ, USA).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4191-5 (29 June 1983).
For pt.I see ibid., vol.105, no.13, p.4185 (1983). To investigate the importance of conformational and substituent factors on geminal ^{13}C-^{13}C coupling constants $^2J_{CC'}$, use is made of both molecular orbital (MO) and valence-bond (VB) techniques. The MO results qualitatively reproduce certain trends due to hybridization, substituents, and bond angle effects, but even these trends appear to be lost in highly strained systems. By means of a VB bond-order formulation for coupling constants, it is demonstrated that $^2J_{CC'}$ is proportional to differences of geminal and vicinal ^{1}H-^{1}H or ^{13}C-^{1}H coupling constants. In the case of geminal ^{13}C-^{13}C coupling involving a methyl group, the dihedral angle dependence disappears, and the relatively small observed magnitudes indicate that the geminal term is effectively cancelled by the several vicinal terms. Substituents at C2 affect $^2J_{CC'}$ in a manner completely analogous to $^2J_{CH}$ and $^2J_{HH'}$. However, the VB formulation shows that substituents at C1 (or C3) should lead to an angular dependence of the vicinal type. In the case of OH substituents the equation $^2J_{CC'}(\phi')=1.7\cos^2\phi'\text{-}0.9\cos\phi'\text{-}1.9$ provides an excellent correlation of the available experimental data. (34 refs.)

106445 Side-chain vs. main-chain conformational flexibility in aromatic dipeptides. V.Rizzo, H.Jackle (Tech.-Chem. Lab., ETH-Zentrum, Zurich, Switzerland).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4195-205 (29 June 1983).
The ^{1}H NMR and CD spectra of Ac-Trp-Trp-NHMe, Ac-Phe-Phe-NHMe, and Ac-Tyr-Tyr-NHMe in either 2,2,2-trifluoroethanol (TFE) or tetrahydrofuran (THF) have been recorded down to subzero temperatures. The results indicate a preferentially folded structure in TFE and an extended one in THF solutions as a common feature for the main chain of the three dipeptides, the evidence being strongest for the case of Ac-Trp-Trp-NHMe. An analysis of the conformational space of this latter molecule helps in delineating four low-energy structures for the peptide backbone, which include three extended conformers and one folded conformer (β-turn, type III). For each of these low-energy structures (only two in the case of Ac-Phe-Phe-NHMe and Ac-Tyr-Tyr-NHMe), ensembles of conformers have been generated comprising many different possible geometries of the side chains. Populations of side-chain rotamers, ring-current effects, coupling constants ($J_{C\alpha HNH}$), and CD spectra have been calculated for each ensemble at 200K and then compared with experimental results obtained at the lowest possible temperature. (63 refs.)

106446 Conformational analysis by NMR spectrometry of the highly substituted cyclic tetrapeptides, chlamydocin and Ala^4-chlamydocin. Evidence for a unique amide bond sequence in dimethyl-d$_6$ sulfoxide. M.Kawai, R.D.Jasensky, D.H.Rich (School of Pharmacy, Univ. of Wisconsin, Madison, WI, USA).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4456-62 (29 June 1983).
The solution conformations of chlamydocin, cyclo(Aib-Phe-D-Pro-L-Aoe), and Ala^4-chlamydocin, cyclo(Aib-Phe-D-Pro-L-Ala), have been investigated by ^{1}H and ^{13}C nuclear magnetic resonance spectroscopy in dimethyl-d_6 sulfoxide. Two conformations of these molecules are present in ratios of approximately 6:4. The conformers interconvert slowly on the NMR time scale, and this slow interconversion is due to a cis-trans isomerization of one amide bond. The 12-membered ring system of conformer I in dimethyl-d_6 sulfoxide is characterized by four transoid amide bonds, with two bis γ-turn intramolecular hydrogen bonds. Conformer II, which is found only in mixed solvents that contain high concentrations of Me$_2$SO, has a cis,trans,trans,trans amide bond sequence. Low-temperature NOE was utilized to determine amide bond geometry in conformer II. Circular dichroism data in different solvents are recorded. Approximate torsional angles of the minor conformer (conformer II) derived from the NMR data and Dreiding models are Aib $\phi+70°$, $\psi+75°$, $\omega-160°$; Phe $\phi+150°$, $\psi-105°$, $\omega+20°$; D-Pro $\phi+85°$, $\psi-140°$, $\omega+165°$; Ala (Aoe) $\phi-105°$, $\psi+80°$, $\omega-160°$, respectively. The cis,trans,trans,trans ring conformation of a cyclic tetrapeptide has not been described previously. (35 refs.)

106447 Isotope effects of benzylic deuterons on chemical shifts of ortho carbons. Correlation with π-bond orders as an indication of a hyperconjugative contribution. L.Ernst (Gesellschaft fur Biotechnol. Forschung, Braunschweig, Germany), H.Hopf, D.Wullbrandt.
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4469-70 (29 June 1983).
The authors investigated the influence of benzylic deuterons on ortho carbon shifts in a series of compounds in which there is a large variation of double-bond character between C_{ipso} and C_{ortho}, but a very similar steric environment of the trideuteromethyl groups. If conjugation or hyperconjugation to some degree influences the sizes of the isotope shifts over three bonds, $^3\Delta$, then one would expect them to depend on the pi-bond order, P_π of the C_{ipso}-C_{ortho} bonds in the same way as regular ortho substituent chemical shifts vary with P_π. For the compounds investigated, the $^3\Delta$ values correlate very strongly with the π-band order. (14 refs.)

106448 Indirect measurement of scalar spin-spin coupling between chemically equivalent hydrogen nuclei. V.Rutar (Dept. of Chem., Univ. of Missouri, Columbia, MO, USA).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4496-7 (29 June 1983).
Accurate measurements of all scalar (*J*) coupling constants between nuclear spins are very important for studies of molecular conformations. Since coupling between chemically (and magnetically) equivalent hydrogen nuclei does not appear in ^{1}H NMR spectra, a special measuring procedure was developed. It is based on the fact that isotopic labeling removes magnetic equivalence and the *J* coupling shows up in the fine splitting of satellite lines arising from natural abundance ^{13}C spins. The author describes an alternative technique that utilizes correlated motion of ^{13}CH spin pairs. (9 refs.)

106449 NMR spectroscopy of cyclohexane. Gas-phase conformational kinetics. B.D.Ross, N.S.True (Dept. of Chem., Univ. of California, Davis, CA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.15, p.4871-5 (27 July 1983).
Gas-phase ^{1}H NMR spectra of cyclohexane display dynamic line-shape effects which are both temperature and pressure dependent. Gas-phase inversion rates are slower and activation parameters are higher than those observed for liquid-phase samples. At 253K chair-chair inversion rates range from 309 to 1290 s^{-1} for samples containing 1 torr of cyclohexane and from 100 to 2500 torr of SF$_5$. The gas-phase unimolecular activation parameters for the chair to transition-state reaction are $E_{act}(\infty)$, 12.5 (5) kcal/mol; $\Delta H^\ddagger$, 12.1 (5) kcal/mol; $\Delta G\ddagger$, 10.4 (2) kcal/mol; and $\Delta S\ddagger$, 5.7 (5) eu. The bimolecular energy is 11.2 (5) kcal/mol. The large value of $\Delta S\ddagger$ and the difference between the unimolecular and bimolecular activation energies are consistent with proposed freely pseudorotating transition-state models. The pressure dependence of the inversion rate agrees with RRKM calculations assuming a freely pseudorotating transition state, indicating stochastic intramolecular vibrational relaxation in cyclohexane as ca. 11.5 kcal/mol, where there are ca. 1300 vibrational states per cm^{-1}. (49 refs.)

106450 ^{17}O NMR as a tool for studying oxygenated transition-metal derivatives: first direct ^{17}O NMR observations of transition-metal-bonded peroxidic oxygen atoms. Evidence for the absence of oxo-peroxo oxygen exchange in molybdenum(VI) compounds. M.Postel, C.Brevard, H.Arzoumanian, J.G.Riess (Lab. de Chimie Minerale Moleculaire, CNRS, Nice, France).
J. Am. Chem. Soc. (USA), vol.105, no.15, p.4922-6 (27 July 1983).
High-resolution ^{17}O NMR observations of peroxidic oxygen atoms bonded to transition metals are reported for ^{17}O-enriched oxoperoxomolybdenum(VI) derivatives as well as for nonenriched alkylperoxo derivatives of platinum. The chemical shifts of the oxo group are reported. The results are interpreted to evaluate the practicability of ^{17}O NMR as a tool to investigate the oxygen chemistry of the transition elements. In the case of the oxo-peroxo Mo(VI) derivative, direct ^{17}O NMR evidence is given that the oxo and peroxo groups do not exchange. (21 refs.)

106451 Secondary isotope multiplet NMR spectroscopy of partially labeled entities. Carbon-13 SIMPLE NMR of carbohydrates. J.C.Christofides, D.B.Davies (Dept. of Chem., Birkbeck Coll., London, England).
J. Am. Chem. Soc. (USA), vol.105, no.15, p.5099-105 (27 July 1983).
^{13}C NMR measurements have been made in Me$_2$SO-d_6 solutions of some carbohydrates (methyl α-D-gluco- and galactopyranosides, melibiose, maltose, and β-cyclodextrin) in which exchangeable protons have been partially deuterated. Signals from single carbon atoms are observed as a series of multiplets (singlets to octets) with intensity ratios that very quantitatively with OH:OD ratios. Partial deuteration of exchangeable protons in molecules permits direct observation of the different isotopomers measured under conditions of slow exchange and the resonance line separations can be analyzed in terms of the two-bond (β) and three-bond (γ) isotope effects that contribute to the deuterium-induced secondary isotope shift. Signal multiplets and magnitudes of isotope effects are used to assign the spectra of carbohydrates as shown for both α- and β-forms of the α1-$\longrightarrow$6 linked (melibiose) and α1$\longrightarrow$4-linked (maltose) reducing disaccharides. (35 refs.)

106452 Nuclear magnetic resonance and PCILO study of the side-chain conformations in *m*-anisaldehyde and 2,5-dimethyloxybenzaldehyde. M.A.Natiello, R.H.Contreras, J.C.Facelli, D.G.de Kowalewski (Dept. de Fisica, Univ. de Buenos Aires, Buenos Aires, Argentina).
J. Phys. Chem. (USA), vol.87, no.14, p.2603-7 (7 July 1983).
A meta effect on the methoxy-group conformation is studied from both an experimental and a theoretical point of view. Experimental NMR data show that, while in *m*-anisaldehyde (I) both side-chain groups undergo a restricted rotation, in 2,5-dimethoxybenzaldehyde (II) the methoxy group in ring position 5 is held fixed in a cis conformation with respect to the aldehyde group, which in turn, presents a carbonyl cis conformation toward that methoxy group. PCILO calculations follow quite closely, in a qualitative sense, all observed trends. (28 refs.)

106453 Structure and dynamics of molecular rotation of 2-pyridone in toluene and methanol by carbon-13 nuclear magnetic resonance. J.Guillerez, B.Tiffon, B.Anclan, J.Aubard, J.E.Dubois (Inst. de Topologie et de Dynamique des Systemes, Univ.-Paris VII, Paris, France).
J. Phys. Chem. (USA), vol.87, no.16, p.3015-17 (4 Aug. 1983).
The structure and dynamics of molecular rotation of 2(1*H*)-pyridone and 1-methyl-2(1*H*)-pyridone in toluene and methanol have been investigated at 305K by ^{13}C NMR. Both chemical shifts and relaxation times show that 2-pyridone forms stable hydrogen-bonded complexes in methanol, reorientating as a proper unit taking with it two solvent molecules. It follows that the lifetimes of these complexes are greater than the rotational correlation time scale-10^{-11}-10^{12} s. (18 refs.)

106454 Rotation barriers of amides in the gas phase. M.Feigel (Dept. of Chem. & Biology, Univ. of Bremen, Bremen, Germany).
J. Phys. Chem. (USA), vol.87, no.16, p.3054-8 (4 Aug. 1983).
The line shape analysis of the gas-phase ^{1}H NMR spectra of six *N,N*-dialkylamides ($R'CONR_2$: $R=CH_3$, $R'=F$, Cl, CH_3, CF_3; $R=i\text{-Pr}$, $R'=CH_3$; $R=C_2H_5$, $R'=H$) and of *N,N*-dimethylthioacetamide give standard free energies of activation which are at least 1-2.3 kcal/mol smaller than the values in various solvents reported previously. The differences are not correlated with the structure and the barrier heights of the amides. In liquids, dipolar interactions and the internal pressure of the solvent increase the rigidity of the amide bond. (31 refs.)

106455 Nuclear electric hexadecapole coupling constant in antimony trichloride. H.Gotou (Inst. of Phys., Univ. of Tsukuba Sakura, Ibaraki, Japan).
J. Magn. Resonance (USA), vol.54, no.1, p.36-45 (Aug. 1983).
The electric hexadecapole coupling constant of ^{123}Sb (nuclear spin $I={}^{7}/_{2}$) in $SbCl_3$ was determined from the accurate measurement of three nuclear quadrupole resonance frequencies, $\nu_1(\pm{}^{1}/_{2}\text{-}\pm{}^{3}/_{2})$, $\nu_2({}^{3}/_{2}\text{-}\pm{}^{5}/_{2})$, $\nu_3(\pm{}^{5}/_{2}\text{-}\pm{}^{7}/_{2})$ at the same sample temperature. To avoid error produced from the change of the sample temperature, ν_1 and ν_2, or ν_2 and ν_3 were alternately and repeatedly measured as quickly as possible, and the relations between them were determined. To measure the NQR frequency quickly without the disturbance by a marker signal, two marker signals were displayed on both sides of the NQR signal. A method to evaluate the real NQR frequency from a slightly asymmetric lineshape was introduced. As a result, three NQR frequencies were determined at each sample temperature. The values of the hexadecapole coupling constant eMm, quadrupole coupling constant eQq, and asymmetry parameter η, were found as follows: when $\nu_2=67.732$ MHz, $eMm=109.8\pm60.6$ kHz, $eQq=480.5177$ MHz, and $\eta=0.1593909$. (14 refs.)

106456 A simple two-dimensional measurement of the decoupler power during continuous homonuclear irradiation for the correction of Bloch-Siegert shifts. R.V.Hosur (Inst. fur Molekularbiologie und Biophys., Eidgenossische Tech. Hochschule Zurich, Zurich, Switzerland), R.R.Ernst, K.Wuthrich.
J. Magn. Resonance (USA), vol.54, no.1, p.142-5 (Aug. 1983).
Recent applications of two-dimensional (2D) ^{1}H NMR techniques for studies of H_2O solutions of biological macromolecules showed that paraticularly favorable conditions for suppression of the solvent line could be achieved with the use of continuous water irradiation at all times except during the observation period, t_2. Adverse effects with this solvent suppression scheme were experienced since irradiation during the evolution time, t_1, may cause intolerably strong Bloch-Siegert shifts which distort the 2D spectrum in the vicinity of the suppressed solvent line. The authors propose to apply the solvent irradiation during t_1 and to use a mathematical correction for the Bloch-Siegert shifts after the two-dimensional Fourier transformation. They describe a simple experiment for the required accurate measurement of the RF field amplitude during continuous irradiation and illustrate the use of a numerical correction of the Bloch-Siegert shifts in 2D NMR spectra. (7 refs.)

106457 Binomial solvent suppression. D.L.Turner (Dept. of Chem., Southampton Univ., Southampton, England).
J. Magn. Resonance (USA), vol.54, no.1, p.146-8 (Aug. 1983).
The Redfield 2-1-4 pulse has long enjoyed unrivaled popularity amongst chemists interested in observing exchangeable protons of compounds in dilute aqueous solution using Fourier transform NMR. The problem of dynamic range in the presence of an intense H_2O peak is neatly avoided by not exciting the water protons, and to this end the pulse sequence was designed to have as clean a hole in its power spectrum as was compatible with convenience. The measure of its success is that the suppression ratios achieved, ca. 100:1, were probably limited primarily by spectrometer stability and, although cleaner power spectra could be generated, they were little used. The author commends the next row of Pascal's triangle as a still better compromise between efficiency and complexity. (9 refs.)

106458 The 1-1 hard pulse: a simple and effective method of water resonance suppression in FT ^{1}H NMR. G.M.Clore, B.J.Kimber, A.M.Gronenborn (Div. of Molecular Pharmacology, Nat. Inst. for Medical Res., London, England).
J. Magn. Resonance (USA), vol.54, no.1, p.170-3 (Aug. 1983).
In protein and nucleic acid NMR, the study of exchangeable protons can provide a wealth of structural information. In general, however, such protons undergo rapid deuterium exchange so that ^{1}H NMR spectra must be recorded in H_2O rather than D_2O. Because the concentration of solute protons ($\sim$1 m*M*) is so much smaller than that of the water protons ($\sim$110 *M*), methods of solvent suppression must be used to overcome the dynamic range and digitization problems imposed by a limited computer word length. The authors present a novel, very simple, and highly effective time-shared hard pulse method for water resonance suppression, the 1-1 pulse. (8 refs.)

106459 Natural abundance ^{15}N NMR of boron-nitrogen compounds: sign and magnitude of $^{1}J(^{15}N^{11}B)$ in tris(methylamino)borane. B.Wrackmeyer (Inst. fur Anorganische Chem., Univ. Munchen, Munchen, Germany).
J. Magn. Resonance (USA), vol.54, no.1, p.174-6 (Aug. 1983).
The efficient relaxation of the ^{11}B nucleus ($I={}^{3}/_{2}$) by electric quadrupole interactions hampers the determination of indirect nuclear spin-spin coupling constants between boron and other elements $^{1}J(^{11}BX)$. This applies in particular to the situation where a three-coordinate ^{11}B nucleus (large electric field gradient) is linked to other quadrupolar nuclei (e.g., ^{11}B, ^{14}N, ^{17}O) or to nuclei with low natural abundance with $I={}^{1}/_{2}$ (e.g., ^{13}C, ^{15}N). The author has now succeeded in measuring $^{1}J(^{15}N^{11}B)$ in tris(methylamino)borane from the ^{15}N NMR spectrum in natural abundance. A partially collapsed quartet is observed from which $^{1}J(^{15}N^{11}B)\geq45$ Hz can be deduced. The spectrum was recorded using the refocused INEPT pulse sequence. (7 refs.)

106460 The ^{14}N and ^{2}H quadrupole coupling tensors in sodium nitroprusside. D.Gross, N.Pislewski, U.Haeberlen, K.H.Hausser (Max-Planck-Inst. fur Medizinsche Forschung, Heidelberg, Germany).
J. Magn. Resonance (USA), vol.54, no.2, p.236-52 (Sept. 1983).
Measurements by straightforward FT NMR at room temperature in a field of 8.4 T are reported of the principal values and directions of the quadrupole coupling (QC) tensors at all nitrogen sites in sodium nitroprusside (SNP), $Na_2Fe(CN)_5NO.2H_2O$. The assignment of the measured QC tensors to the ^{14}N sites in SNP is discussed. All ^{14}N QC tensors in SNP are nearly axially symmetric. The unique axes of these tensors are parallel to the bond directions of the respective CN and NO ligands within the accuracy of this and the X-ray experiment by which the bond directions were established. The feasibility is discussed of measuring ^{14}N QC tensors in the so-called new state of SNP discovered by Hauser and coworkers (1978). The QC tensors at the hydrogen sites in SNP were measured using deuterated crystals of SNP. These measurements show that the water molecules in SNP undergo a flip process which at room temperature is fast on the time scale of deuteron quadrupole couplings (≈5 μsec) whereas it is slow on this time scale at 77K. The unique directions of the deuteron QC tensors are off the O-D bond directions established by X-ray scattering by as much as 11°. It is argued that the measurement of deuteron QC tensors provides much more accurate information about the orientation of water molecules in hydrates than can be inferred from X-ray scattering data. (14 refs.)

106461 Deuteron quadrupole coupling constants of deuterobromoform and deuteroiodoform determined from direct ^{13}C-^{2}H couplings in ^{2}H NMR spectra. G.C.Lickfield, S.E.Emery, R.V.Gregory, T.C.Chen, A.L.Beyerlein, G.B.Savitsky (Dept. of Chem. & Geology, Clemson Univ., Clemson, SC, USA).
J. Magn. Resonance (USA), vol.54, no.2, p.305-8 (Sept. 1983).
In a recent determination of the deuteron quadrupole coupling constant, Q_D, of $CDCl_3$ from direct ^{13}C-^{2}H couplings in ^{2}H NMR spectra (Lickfield et al., 1983), it was found that the value of Q_D was significantly dependent on the nature of the nematic solvent used to orient the molecule in the magnetic field. The lowering of the Q_D value of $CDCl_3$ in the Phase IV and chemically similar liquid crystals could well be due to hydrogen bonding with the various functional groups of the crystal. Since there is evidence that the order of hydrogen bonding strength in haloforms is $Cl>Br>I$, the authors have determined the Q_D of $CDBr_3$ and CDI_3 in ZLI-1167 and Phase IV in order to further address this problem. A spectroscopic study of the haloforms in the two nematic phases was also attempted in the hope of comparing the extent of hydrogen bonding that these liquid crystals may have on the haloforms. Unfortunately, intense bands in the IR of these liquid crystals overlap with the absorption bands of interest of the haloforms. Therefore, the IR of CH_3OH at 10% molar concentration in both crystals was measured since the OH stretching mode of CH_3OH is free from interference. (16 refs.)

106462 The ^{1}H and ^{13}C chemical shift anisotropies of 2-butyne determined by NMR of the oriented molecule. P.Diehl, F.Moia (Dept. of Phys., Univ. of Basel, Basel, Switzerland).
J. Magn. Resonance (USA), vol.54, no.2, p.312-13 (Sept. 1983).
The authors dissolved 2-butyne in various liquid crystals solvents such as Merck ZLI 1167, EBBA, and a mixture of 52 wt.% of ZLI 1167 with 48 wt.% of ZLI 1132. At this concentration the anisotropy of the diamagnetic susceptibility of the solvent vanishes and the liquid crystal optic axis rotates by 90°, allowing a determination of the shift anisotropy. This method is called NEMIX. (6 refs.)

106463 EPR studies of methylated benzo(*a*)pyrene cation radicals. P.D.Sullivan (Dept. of Chem., Ohio Univ., Athens, OH, USA).
J. Magn. Resonance (USA), vol.54, no.2, p.314-18 (Sept. 1983).
EPR spectra have been obtained from benzo[*a*]pyrene (BP) and all 12 monomethyl derivatives in concentrated H_2SO_4. The 1-, 2-, 3-, 4-, 5-, 8-, 9-, 11-, and 12-methyl BPs were obtained from the NCI Chemical Repository and 6-, 7-, and 10-methyl BPs were synthesized by literature methods. The spectra have enabled the author to estimate and assign splitting constants to all positions in the BP cation radical. (13 refs.)

106464 Study by NMR of organic compounds containing chalcogenes. VIII. ^{13}C NMR of chromannone, chromone, coumarannone-3 and coumarine and their sulphur, selenium and tellurium analogues. M.Baiwir, G.Llabres (Inst. de Phys. B5, Univ. de Liege au Sart Tilman, Liege, Belgium), L.Christiaens, A.Luxen, J.-L.Piette.
Spectrochim. Acta Part A (GB), vol.39A, no.8, p.693-8 (1983).
^{13}C NMR spectra of the title compounds have been fully assigned. The results have been compared with those relative to other chalcogenated compounds, such as anisole, phenyl benzoate, benzofuran, ... and their analogs. In chalcogenochromones and -coumarines, the heteroatom lone pair delocalization spreads to some extent over the heterocyclic part of the molecules, while in chalcogenochromanones and -indoxyles, it only extends to the homocycle. This electronic effect seems also to affect the heavy atom effect exhibited by Te-containing compounds. (33 refs.)

106465 ^{13}C-NMR study of cresyl benzoates. S.P.Srivastava, A.K.Bhatnagar, G.C.Joshi (Indian Inst. of Petroleum, Dehradun, India).
Spectrochim. Acta Part A (GB), vol.39A, no.8, p.713-15 (1983).
The proton-decoupled ^{13}C FT-NMR spectra of para-, meta- and ortho-cresyl benzoates have been recorded and the observed signals have been assigned following the substituent additivity rule. The important features of diagnostic value of these spectra are discussed. (7 refs.)

106466 ^{13}C NMR spectra of β-aminoalcohols derivatives of isophedrine and of their oxazolidines. M.Gelbcke, M.Baudet (Lab. de Chimie Pharmaceutique Organique et de Bromatologie, Univ. Libre de Bruxelles, Bruxelles, Belgium).
Spectrochim. Acta Part A (GB), vol.39A, no.8, p.717-27 (1983).
The carbon-13 NMR spectra of β-aminoalcohols related to nor and pseudonor-isoephedrine ($N\text{-}CH_3$; $N\text{-}C_2H_5$; $N\text{-}iC_3H_7$) and the series of the corresponding oxazolidines from formaldehyde and benzaldehyde were obtained and discussed. The configuration of the 3-alkyl-2,4-diphenyl-5-methyloxazolidines was established. (12 refs.)

106467 Conformational and spectral investigations of thiazolidinone derivatives by ^{1}H and ^{13}C NMR spectroscopy. I.Dogan, S.Icli (Dept. of Chem., Middle East Tech. Univ., Ankara, Turkey).
Spectrosc. Lett. (USA), vol.16, no.7, p.499-511 (1983).
The magnetic non-equivalence of isomeric proton and ^{13}C nuclei has been investigated on rotational isomers of 3-aryl-2,4-thiazolidinediones and 3-aryl-2-arylimino-4-thiazolidinones. The detection of magnetic non-equivalence for proton nuclei was better in quinoline solutions. Free energies of activation have been estimated. The varying hetero atom in the hetero ring is seen to

effect the additive shift parameters and the shielding of distant aryl carbon bonded to hetero ring. (6 refs.)

106468 Semiempirical calculation of ^{13}C NMR screening tensors of organic molecules. W.Meiler, T.Weller, G.Kluge, R.Lochmann, D.Deininger (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).
Z. Phys. Chem., Leipzig (Germany), vol.264, no.4, p.753-67 (1983). In German.
The ^{13}C-NMR screening tensors for various simple organic molecules have been calculated using CNDO wave functions. Besides the standard parametrization of the CNDO/2 method other parametrizations are applied. The comparison with the experimental data shows that parametrizations scaled for an interpretation of optical spectra are more suitable also for a calculation of NMR screening data than the standard parametrization. Chemical shifts calculated by some of these methods are in qualitative agreement with measured values. (32 refs.)

33.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

106469 ESR of the cation radicals from γ-irradiated ketenes in haloalkane and SF_6 matrices. K.Shimokoshi (Dept. of Chem., Tokyo Inst. of Technol., Tokyo, Japan), J.Fujisawa, K.Nakamura, S.Sato, T.Shida.
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.483-6 (19 Aug. 1983).
The cation radicals of ketene and its methyl and ethyl derivatives have been produced in γ-irradiated solid solutions of haloalkanes and SF_6. From the observed isotropic proton hyperfine parameters of these cation radicals and UHF MO (INDO) calculations, the cations are found to be characteristic of ordinary π-radicals. (9 refs.)

106470 Influence of the relative position of nitro groups on intermolecular sodium exchange processes in dinitrobenzene ion pairs, investigated by EPR spectroscopy. M.Branca, A.Gamba (Istituto di Chimica Fisica, Univ. di Sassari, Sassari, Italy), C.Oliva.
J. Magn. Resonance (USA), vol.54, no.2, p.216-25 (Sept. 1983).
The EPR spectra of the anion radicals of nitrobenzene isomers in aprotic solvents with added sodium tetraphenylborate show an intermolecular cation-exchange reaction in which the incoming cation goes to the uncomplexed nitro group. The activation energy barriers $\Delta H\ddagger$ are almost the same for the *m* and *p* isomers, while the activation free energy $\Delta G\ddagger$ is dependent on the relative position of the two nitro groups, probably due to different solvation effects. The transport properties of the systems were also investigated. The spin distribution was computed by the McLachlan method (1960), modified according to McClelland (1961), both for the ion pairs and for the triple ions which are the intermediates of the intermolecular cation exchange. (18 refs.)

EPR evidence on the structure of the copper(II)-bacitracin A complex .... See Entry 109960

33.35 DOUBLE RESONANCES AND OTHER MULTIPLE RESONANCES

106471 Infrared optical double resonance spectroscopy of ND_2. R.E.Muenchausen, G.W.Hills (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.335-41 (12 Aug. 1983).
Infrared optical double resonance (IODR) effects have been observed in ND_2. The infrared transitions, $5_{05}\leftarrow 5_{14}$ $(F_1\leftarrow F_1)$ and $2_{12}\leftarrow 2_{21}$ $(F_2\leftarrow F_2)$, in the ν_2 band of ND_2 were efficiently pumped with P(10) of $^{12}C^{18}O_2$ at 1076.57 cm^{-1} and R(26) of $^{12}C^{16}O_2$ at 1082.30 cm^{-1}, respectively. IODR signals were detected by exciting various rovibronic transitions of $\tilde{A}^2A_1\leftarrow\tilde{X}^2B_1$ with a rhodamine 6G dye laser. The P(10) transition of $^{12}C^{18}O_2$ is coincident, within the Doppler width with $5_{05}\leftarrow 5_{14}$ $(F_1\leftarrow F_1)$ of ν_2, ND_2. For this laser line three- and four-level (collisional) IODR signals are observed for both the (000) and (010) vibrational states. The $2_{12}\leftarrow 2_{21}$, $(F_2\leftarrow F_2)$ transition is 120 ± 20 MHz above R(26) of $^{12}C^{16}O_2$. (12 refs.)

106472 Fourier transform heteronuclear magnetic triple resonance in complex spin systems. III. Symmetrical ditertiary phosphine complexes of group VI metal carbonyls. G.T.Andrews, I.J.Colquhoun, W.McFarlane (Chem. Dept., City of London Polytech., London, England).
Polyhedron (GB), vol.2, no.8, p.783-90 (1983).
Magnetic multiple resonance experiments of the types ^{13}C-$\{^{31}P,{}^1H\}$, ^{13}C-$\{^1H\}$ and ^{31}P-$\{^{183}W,{}^1H\}$ have been used to determine the magnitudes and signs of P-C and P-P coupling constants in the symmetrical complexes $LM(CO)_4$ ($L=Ph_2P(CH_2)_nPPh_2$, $Ph_2PN(H)PPh_2$, $(Ph_2P)_2C=CH_2$, cis-$Ph_2PCH=CHPPh_2$; $M=Cr$, Mo, W; $n=1$-4). A knowledge of the signs of the couplings shows that they display a systematic pattern of behaviour according to metal atom and ring size and this may have diagnostic value. ^{13}C, ^{31}P and ^{183}W chemical shifts are also reported. (21 refs.)

106473 ENDOR study of VO^{2+} adsorbed on Y zeolite. H.van Willigen, T.K.Chandrashekar (Dept. of Chem., Univ. of Massachusetts, Boston, MA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4232-5 (29 June 1983).
Electron paramagnetic resonance (EPR) has been used extensively in studies of the structure of transition metal ion exchanged zeolites. Use is made of the fact that data on *g* values and metal ion hyperfine splitting constants provide an insight into the structure of the cation binding site. Electron nuclear double resonance (ENDOR) makes it possible to measure the interactions between the unpaired electrons and nuclear spins in the vicinity of the paramagnetic cation. Generally, these interactions remain unresolved in the EPR spectra of these amorphous systems. The ENDOR technique can be used to study cation solvation in the zeolite cavities and changes in cation environment induced by removal of solvent molecules or co-adsorbed molecules. Subtle structural changes that do not register in the EPR spectrum can have a profound effect on the ENDOR spectra. The results suggest that ENDOR can be of great value in studies of transition metal ion adsorption on zeolites as well as other porous surfaces. (21 refs.)

106474 Direct observation of high-lying $^3\Pi_g$ states of the Na_2 molecule by optical-optical double resonance. Li Li, R.W.Field (Dept. of Chem., MIT, Cambridge, MA, USA).
J. Phys. Chem. (USA), vol.87, no.16, p.3020-2 (4 Aug. 1983).
Eight Na_2 vibrational levels belonging to at least two electronic states of $^3\pi_{Og}$ symmetry have been observed near 34000 cm^{-1} by optical-optical double resonance (OODR) fluorescence excitation spectroscopy. A unique feature of this work is that the intermediate levels in this $^3\Pi_{Og}\leftarrow X^1\Sigma_g{}^+$ OODR excitation scheme are singlet-triplet mixed $J=12$-15 levels of the $A^1\Sigma_u{}^+(\nu=22)$-$b^3\pi_{Ou}(\nu=24)$ perturbation complex. (22 refs.)

106475 Sign determination of ^{13}C-^{13}C coupling constants by sign-labeled polarization transfer. O.W.Sorensen, R.R.Ernst (Lab. fur Phys. Chem., Eidgenossische Tech. Hochschule Zurich, Zurich, Switzerland).
J. Magn. Resonance (USA), vol.54, no.1, p.122-33 (Aug. 1983).
A new pulse sequence, which allows the determination of the signs of ^{13}C-^{13}C *J*-coupling constants from natural abundance samples, is presented. The technique uses proton polarization transfer and proton decoupling. The signs of the coupling constants are manifested in the polarities of the resulting proton-decoupled ^{13}C signals. (14 refs.)

106476 Modified selective population transfer experiments. Methods for selective decoupling and suppression of unwanted signals. H.J.Jakobsen, P.J.Kanyha, W.S.Brey (Dept. of Chem., Univ of Florida, Gainesville, FL, USA).
J. Magn. Resonance (USA), vol.54, no.1, p.134-41 (Aug. 1983).
Two pulse sequences, based on the selective population transfer experiment, greatly extend and improve the applications of this polarization transfer method. One of these sequences copes with situations where it is desirable to apply selective decoupling to a group of magnetically equivalent protons which are also used for polarization transfer. The resulting spectrum is both enhanced with all remaining lines in phase and simplified to permit more facile interpretation as is demonstrated for the ^{29}Si NMR spectrum of vinyltrimethylsilane. The second pulse sequence is an improvement of the conventional SPT difference spectroscopy method. Selective π pulses are applied alternatively to the low- and high-frequency satellites in the ^1H spectrum with a concurrent 180° phase shift of the 90° 'read' pulse. This sequence is used for the suppression of strong unwanted signals (e.g., solvent peaks) and does not involve acquisition of these signals in the FIDs. An enhanced coupled or decoupled spectrum for the weak resonances is obtained as is demonstrated by uncovering the signals for the CND_2CN isotopomer from the ^{13}C spectrum of 99% deuterium enriched CD_3CN. (28 refs.)

106477 Mechanism of spin transfer to β protons in π radicals. Analysis of anisotropic hyperfine couplings. M.Brustolon, A.L.Maniero (Istituto di Chimica Fisica, Univ. di Padua, Padua, Italy).
J. Magn. Resonance (USA), vol.54, no.2, p.190-200 (Sept. 1983).
Free radicals produced by γ irradiation in succinic acid and potassium trihydrogen disuccinate are identified and studied by ENDOR. The dipolar tensors of β protons are discussed and compared with several tensors of the same type in the literature. A dependence of the largest principal value on the conformation of the radical is accounted for by a McConnell-Strathdee-Derbyshire calculation (1959, 1962) by taking into account hyperconjugative spin delocalization on the β protons and also spin polarization of π electrons. The relative amounts of spin density on β protons from hyperconjugation and from spin polarization are evaluated as 70 and 30%, respectively. The principal direction corresponding to the largest principal value is calculated for different conformations and is compared with the carbon-hydrogen direction. (31 refs.)

106478 Excitation and dissociation of SF_6 molecules in a two-frequency infrared laser field. S.S.Alimpiev, B.O.Zikrin, B.G.Sartakov, E.M.Khokhlov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.943-51 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1634-49 (Nov. 1982). [received: Sept. 1983]
The spectral and energy characteristics of the excitation and dissociation of SF_6 molecules in a two-frequency infrared laser field are investigated. The quantum efficiency of two-frequency dissociation is found to depend on the frequency of the second field and on the excitation level in the first. The linear-absorption spectra of SF_6 molecules excited by a laser field are obtained. The parameters of these spectra differ significantly from the thermal ones. (16 refs.)

33.35H MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)

106479 Laser excitation spectrum and microwave optical double resonance spectrum of the $3_0{}^1$ band in the $\tilde{a}^3A_2$-$\tilde{X}^1A_1$ system of H_2CS: the hyperfine structure of the $\tilde{a}^3A_2$ state. T.Suzuki, S.Saito, E.Hirota (Inst. for Molecular Sci., Okazaki, Japan).
J. Chem. Phys. (USA), vol.79, no.4, p.1641-57 (15 Aug. 1983).
The dye laser excitation spectrum of the $3_0{}^1$ band in the $\tilde{a}^3A_2\leftarrow\tilde{X}^1A_1$ transition of H_2CS was observed in the region 15280 to 15400 cm^{-1} with Doppler-limited resolution. The observed spectrum was analyzed to yield pre-

cise values for the rotational constants, the centrifugal distortion constants, and the spin-spin and the spin-rotation interaction constants in the upper triplet state and for the band origin. Transitions with $K_a'=4$ and 5 revealed the effect of the *c*-type Coriolis interaction between the $\nu_3'=1$ and $\nu_6'=1$ states, which, when analyzed, allowed determination of the ν_3-ν_6 difference to be 99.341 cm^{-1}. 15 *K*-type doubling transitions and two *a*-type *R* branch transitions in the $\tilde{a}$ state were observed by a microwave or radio-frequency optical double resonance technique, of which two *K*-doubling transitions of $K_a=1$ and two *R* branch transitions (all F_3 components) were resolved into three hyperfine components. From the observed splittings the proton hyperfine coupling constants were determined to be $a_F=27.7(25)$, $T_{bb}+T_{cc}=12.8(44)$, and T_{bb}-$T_{cc}=7.89(19)$ MHz with one standard errors in parentheses. 33.45B Zeeman and Stark effects

106480 Non-linear Stark polarization spectroscopy. M.E.Coles, R.F.Curl,Jr. (Chem. Dept., Rice Univ., Houston, TX, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.494-9 (19 Aug. 1983).
The effects of electric and magnetic fields upon the polarization of a single mode CW dye laser propagating through a low pressure sample of NO_2 have been explored. It is found that with electric field modulation the various Stark sensitive features in the complex NO_2 visible spectrum affect the polarization, producing a spectrum with a much simpler appearance than the normal absorption spectrum. The signal magnitudes are proportional to the square of the laser power. These electric field modulation signals are dominated by the influence of a weak stray laboratory magnetic field. All the phenomena observed are thought to arise from non-linear level crossing. (11 refs.)

106481 Precise Stark-effect measurements in the $^2\Sigma$ ground state of CaCl. W.E.Ernst, S.Kindt, T.Torring (Inst. fur Molekulphys., Freie Univ. Berlin, Berlin, Germany).
Phys. Rev. Lett. (USA), vol.51, no.11, p.979-81 (12 Sept. 1983).
By use of the molecular-beam microwave-optical double-resonance technique the first high-precision Stark-effect measurement of an alkaline-earth monohalide has been performed. Low-field Stark shifts of rotational transitions in the $v=0$, $X^2\Sigma$ state of CaCl exhibited an unexpectedly complicated field dependence which, however, has been shown to be in complete agreement with an exact theoretical calculation. 33.45C Magnetic circular dichroism

106482 Natural and magnetic circular dichroism spectra of selenofenchone. Evidence for a singlet-triplet component of the $n\rightarrow\pi^*$ transition of selenoketones. W.M.D.Wijekoon (Dept. of Chem., Univ. of Nevada, Reno, NV, USA), E.Bunnenberg, R.Records, D.A.Lightner.
J. Phys. Chem. (USA), vol.87, no.16, p.3034-7 (4 Aug. 1983).
Blue (-)-selenofenchone (1) is observed to give a negative long-wavelength Cotton effect (CE), $\Delta\varepsilon_{573}{}^{max}=-0.86$, in addition to a series of CEs down to 190 nm, $\Delta\varepsilon_{270}{}^{max}=-5.21$, $\Delta\varepsilon_{232}{}^{max}+4.90$, in its circular dichroism (CD) spectrum measured in *n*-heptane. The long-wavelength CD (573 nm) and UV (625 nm) λ_{max} of 1 are found surprisingly well separated. Support for the singlet-triplet nature of this electronic transition may be found in a sharp positive magnetic CD band centered near 630 nm in (±)-selenofenchone. The CD and UV data are compared with those of thiofenchone and fenchone. (19 refs.)

Model compounds for protonation of benz[a]phenazine: spectroscopy of protonated 1,2- and 3,4-benzacridines ....See Entry 109716

33.50 FLUORESCENCE, PHOSPHORESCENCE; RADIATIONLESS TRANSITIONS (INTERSYSTEM CROSSING, INTERNAL CONVERSION)

106483 Interstate dynamics in xanthione: a picosecond photon-echo and optical study. L.W.Molenkamp, D.P.Weitekamp, D.A.Wiersma (Dept. of Phys. Chem., Univ. of Groningen, Groningen, Netherlands).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.382-7 (19 Aug. 1983).
Accumulated photon-echo decays have been measured for the $S_1\leftarrow S_0$ origin and several vibronic transitions of dilute xanthione in a xanthone host crystal. The temperature-dependent dephasing is explained as activation of a local phonon mode, while the low-temperature (1.7K) decay determines the intersystem crossing rate to T_1 to be 19.6 ps. An interference in the echo experiment is analyzed and shown to be due to triplet-state absorption. Dispersed phosphorescence measurements with excitation into either S_1 or directly into the $T_1{}^z$ spin sublevel show that the spin-lattice relaxation of this level is rapid compared with its decay to S_0 even at 1.7K. (19 refs.)

106484 Laser-induced fluorescence of the HSiF radical. H.U.Lee, J.P.Deneufville (Materials Dev. Lab., Energy Conversion Devices Inc., North Branch, NJ, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.394-8 (19 Aug. 1983).
HSiF has been detected by laser-induced fluorescence, following the formation of the ground-state radical in the flow reaction of SiH_4 with F_2 at a total pressure of 0.05-0.15 Torr. The authors report the radiative lifetime of the first vibronic state of HSiF ($\tilde{A}^1A''$) as well as a tentative assignment of the prominent bands of the $\tilde{A}^1A''$-$\tilde{X}^1A'$ transition. (15 refs.)

106485 Assignment of the E absorption transitions in C_6D_6 by means of isolated-molecule fluorescence spectra. Y.Takagi, M.Sumitani, D.O'Conner, N.Nakashima, K.Kamogawa, Y.Udagawa, K.Yoshihara (Inst. for Molecular Sci., Okazaki, Japan).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.445-9 (19 Aug. 1983).
Fluorescence spectra following narrow bandwidth excitation of C_6D_6 have been observed and their structure analysed. Excitation of the $E_1{}^0$ absorption band gives rise to fluorescence that cannot originate from a level with ν_8 excited. (15 refs.)

106486 Shift and quenching of fluorescence of tetrahydronaphthols due to hydrogen bonding. K.Chatterjee, S.Laha, S.Chakravorti, T.Ganguly, S.B.Banerjee (Optics Dept., Indian Assoc. for the Cultivation of Sci., Calcutta, India).
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.88-92 (26 Aug. 1983).
Fluorescence intensity of 5,6,7,8-tetrahydronaphthols in cyclohexane is enhanced due to hydrogen bonding with ethanol and dioxane. Triethylamine produces large changes in absorption and fluorescence spectra, and at 300K fluorescence is quenched due to transfer of electronic excitation and short-lived CT complex formation in the fluorescent state. At 77K there is no quenching as the molecular orientation is restricted. Possible reaction schemes are described. (27 refs.)

106487 Internal heavy-atom effect on the T_1 states on monochloroquinolines and monochloronaphthalenes. J.Najbar, W.Jarzeba, Z.H.Urbanek (Inst. of Chem., Jagiellonian Univ., Krakow, Poland).
Chem. Phys. (Netherlands), vol.79, no.2, p.245-53 (1 Sept. 1983).
The triplet lifetimes and luminescence quantum yields were measured for seven monochloroquinolines, 2-methyl-4-chloroquinoline, 2-chloro-4-methylquinoline and two monochloronaphthalenes in ethanol at 77K. The positional dependence of the rate constans for the $T_1\rightarrow S_0$ transitions in the chloroquinolines and chloronaphthalenes were analysed using the Freed-Jortner model of the displaced potential functions for aromatic hydrocarbons. The energy gap dependence of the radiationless transition was found to be very important for the discussion of the internal heavy-atom effect. The relation between theory and experiment is satisfactory when the C-H out-of-plane vibrations are chosen as promoting modes for the relaxation of the triplet state for monochloroquinolines. (31 refs.)

106488 Temperature dependence of J-band aggregate of the dye 1,1′-diethyl-2,2′-cyanine bromide studied by steady-state and time-resolved picosecond fluorescence spectroscopy. Z.X.Yu, P.Y.Lu, R.R.Alfano (Phys. Dept., City Coll. of New York, New York, NY, USA).
Chem. Phys. (Netherlands), vol.79, no.2, p.289-96 (1 Sept. 1983).
Steady-state and time-resolved picosecond fluorescence spectra of the J-band aggregate state of the dye 1,1′-diethyl-2,2′-cyanine bromide were measured at different temperatures. When the temperature was lowered below 210K, two narrow bands centered at 572 and 577 nm appeared in the absorption and fluorescence spectra arising from the formation of the J aggregate. The time-resolved fluorescence study showed that the relaxation decay time of the J-band was ≈20 ps while that of the monomer band was ≈300 ps. (16 refs.)

106489 Kinetics and mechanism of the $CS_2(^3A_2)$ decay. J.A.Duenas Fananas, A.Cabello (Dept. de Quimica-Fisica, Facultad de Quimica, Univ. Complutense, Madrid, Spain).
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.1050-6 (July-Aug. 1983).
From the rate constants for the $CS_2(^3A_2)$ decay obtained by laser-induced fluorescence and using a vibrational cascade model the authors have calculated the average value of the vibrational quantum transferred on each deactivating collision, as well as the second-order rate constants for vibrational and electronic quenching. (12 refs.)

106490 Electron-impact luminescence spectra and neutral fragments: identification of neutral fragments by use of fragment emissions. A.Inoue, S.Yoshida, N.Ebara (Dept. of Chem., Coll. of Arts & Sci., Univ. of Tokyo, Tokyo, Japan).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.209-16 (1 Sept. 1983).
Electron-impact luminescence spectra were measured for cyclohexanol, acetic acid, pyridine, pyrimidine, benzonitrile, aniline, nitrobenzene, *p*-methoxynitrobenzene, 1-chlorobutane, 1-chloropentane, tetrahydrofuran and anisole. The spectra were analyzed and compared with the literature data of mass spectrometry. Fragment emissions of $OH(A^2\Sigma^+$-$X^2II)$, $CN(B^2\Sigma$-$X^2\Sigma)$, $NO(B^2II$-$X^2II)$ and HCl^+ $(A^2\Sigma$-$X^2II)$ can be used for the identification of neutral fragments of OH and H_2O, HCN, NO and HCl, respectively. (31 refs.)

106491 Dimers in jet-cooled *s*-tetrazine vapor: structure and electronic spectra. C.A.Haynam, D.V.Brumbaugh, D.H.Levy (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1581-91 (15 Aug. 1983).
Dimers with two distinct conformations form as *s*-tetrazine vapor ($C_2N_4H_2$) is cooled in a supersonic jet expansion. Rotationally resolved laser-induced fluorescence excitation spectra of both hydrogen and deuterium substituted dimers have been obtained with single frequency scanning dye lasers. Dimer structures were determined by a combined rotational contour generating program and nonlinear least squares fitting procedure. One dimer conformation is planar with two translationally equivalent monomer units. In this conformation one hydrogen of each ring is in close proximity to the nitrogen lone pair of the other, allowing for stabilization by weak hydrogen bonds. The center-to-center ring separation is 5.6 Å. The other dimer conformation is *T* shaped with symmetrically inequivalent rings giving rise to two electronic transitions with different rotational band types. In this configuration, one hydrogen of the first monomer is in close proximity to the π cloud of the second monomer, and the ring centers are separated by 4.4 Å. The two electronic transitions are due to two close lying electronically excited states where the electronic excitation is localized on one or the other of the two rings. Additional spectral features are attributed to dimer vibrations and larger clusters. (24 refs.)

106492 The photophysics and photochemistry of weakly bound dimers of *s*-tetrazine. L.Young, C.A.Haynam, D.H.Levy (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1592-604 (15 Aug. 1983).
Energy redistribution within the excited states of the planar and *T*-shaped dimers of *s*-tetrazine was monitored by dispersed emission following selective vibronic excitation. When the dimer contained excess vibrational energy above the electronic origin, three processes were observed: (1) energy transfer from the initially populated ν_{6a} vibration (in-plane stretch) to low frequency dimer vibrations involving motion of one monomer subunit with respect to the other; (2) electronic energy transfer from the high energy ring (∥ polarized) to the low energy ring (⊥ polarized) in the *T*-shaped dimer; and (3) photodissocia-

tion of the *T*-shaped dimer into monomer subunits. Simultaneously observed fluorescence from the initially populated state allows us to estimate the rates at which these processes occur. The observation of photodissociation ($\tau=38$ ps) of the *T*-shaped dimer with an input of 1595 cm^{-1} of excess vibrational energy yields an estimate for the binding energy in the ground state $E_b<1552$ cm^{-1}. (15 refs.)

106493 Site dependence of the 1 ^1A_g to 2 ^1Ag transition of all-trans-1,3,5,7-octatetraene. B.E.Kohler, J.B.Snow (Dept. of Chem., Wesleyan Univ., Middletown, CT, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2134-8 (1 Sept. 1983).
Highly resolved emission and one-photon fluorescence excitation spectra and fluorescence lifetimes for all-trans-1,3,5,7-octatetraene substituted in a series of *n*-alkane crystals maintained at liquid helium temperatures have been measured. In the *n*-octane host, the 1 ^1A_g to 2 ^1A_g transition is strictly symmetry forbidden: In other hosts, the spectra exhibit both allowed and symmetry forbidden (built on odd symmetry vibrational modes) components of the spectra are sensitive to local perturbations, the energies of the excited 1 ^1A_g and 1 ^1B_u states and the vibrational development of the 1 ^1A_g to 2 ^1A_g transition are nearly the same in all of the hosts studied. The increase in the allowed component of the spectrum with increasing site perturbation correlates with a decrease in the measured fluorescence lifetime. (9 refs.)

106494 Fluorescence excitation spectrum of triptycene in a supersonic jet. R.Bersohn, U.Even, J.Jortner (Dept. of Chem., Tel Aviv Univ., Tel Aviv, Israel).
J. Chem. Phys. (USA), vol.79, no.5, p.2163-7 (1 Sept. 1983).
The laser-induced fluorescence excitation spectrum of triptycene in pulsed supersonic expansions of He reveals the electronic origin of the $S_0 \rightarrow S_1(^1A_1 \rightarrow ^1E')$ transition at 2750.85 Å (36 352 cm^{-1}), followed by 19 vibrational excitations in the energy range 350 cm^{-1} above it. This vibrational structure corresponds to the excitations of four torsional modes of the phenyl rings. Mechanical models for these torsional modes indicate the existence of three doubly degenerate vibrations, exhibiting Jahn-Teller coupling with the $^1E'$ state, together with double excitations of a nondegenerate vibration. At excess vibrational energies of 350-1000 cm^{-1} above the S_1 origin in the laser-induced fluorescence spectrum is extremely weak and devoid of any structure, implying the onset of a new effective intramolecular decay channel which may result in isomerization in the isolated molecule. (21 refs.)

106495 Electronic absorption spectrum of Hg-Ar complex in a supersonic jet. K.Fuke, T.Saito, K.Kaya (Dept. of Chem., Keio Univ., Yokohama, Japan).
J. Chem. Phys. (USA), vol.79, no.5, p.2487-8 (1 Sept. 1983).
The profile of the 253.7 nm resonance line ($^3P_1$) of mercury atom (Hg) perturbed by noble gases has been the subject of numerous investigations for many years. Because of the broadness of the observed absorptions and emissions which up to now were only obtained by an experiment at high temperature, the exact analysis of the electronic structures of Hg-noble gas complexes is still the subject of ambiguities. The authors' preliminary result on the well resolved electronic spectrum of Hg-Ar complex measured in a supersonic jet is presented. The Hg-Ar complex was obtained by the free expansion of heated Hg vapor (340K) seeded in a mixture of 300 Torr Ar and 3 atm He. The electronic spectrum was measured by the fluorescence excitation method monitored in the UV region. (7 refs.)

33.65 PHOTOELECTRON SPECTRA

106496 Angle-resolved photoelectron spectroscopy of the chloro-substituted methanes. P.R.Keller, J.W.Taylor (Dept. of Chem., Univ. of Wisconsin-Madison, Madison, WI, USA), T.A.Carlson, F.A.Grimm.
Chem. Phys. (Netherlands), vol.79, no.2, p.269-76 (1 Sept. 1983).
The angular distribution parameter, β, was determined for the valence orbitals (IP<21.2 eV) of CCl_4, $CHCl_3$, CH_2Cl_2, and CH_3Cl in the 10-30 eV photon energy range using dispersed polarized synchrotron radiation. The energy dependence of β in the photoelectron energy range of 2 to 10 eV for the non-bonding chlorine n(Cl) orbitals of these molecules was found to be similar for all n(Cl) orbitals investigated. The energy dependence of β for the σ orbitals in these molecules was similar to that observed previously for other σ orbitals. The experimental CCl_4 results were compared with theoretical CCl_4 results obtained using the $X\alpha$ multiple scattering formalism. Theory predicts the existence of two strong shape resonances in each of the valence orbitals of CCl_4. The overall agreement between experiment and theory is evaluated along with the experimental evidence concerning the verification of the predicted shape resonances. (13 refs.)

106497 Triply differential photoelectron studies of the four outermost valence orbitals of cyanogen. D.M.P.Holland (Inst. of Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA), A.C.Parr, D.L.Ederer, J.B.West, J.L.Dehmer.
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.195-208 (1 Sept. 1983).
Photoelectron measurements, differential in incident wavelength, photoelectron energy and photoelectron ejection angle, have been performed on cyanogen, C_2N_2, from threshold to a photon energy of 24 eV, using synchrotron radiation. The results are presented in the form of photoionization branching ratios and photoelectron angular distributions, including vibrationally resolved results for the outermost orbital, $1\pi_g$. Some evidence for resonant processes is observed and discussed within the framework of recent work on related molecules. However, reliable assignments require further theoretical guidance with regard to the location and identities of possible shape resonances and autoionizing intravalence transitions in the C_2N_2 spectrum. (76 refs.)

106498 The high-resolution photoelectron spectrum of N_2O. The $\tilde{B}(^2\pi_i)$ state. T.Cvitas, L.Klasinc, B.Kovac (Rugjer Boskovic Inst., Zagreb, Yugoslavia), R.McDiarmid.
J. Chem. Phys. (USA), vol.79, no.4, p.1565-8 (15 Aug. 1983).
The complex photoelectron spectrum of the $\tilde{B}$ state of N_2O^+ has been remeasured at high resolution and a novel model proposed to interpret the improved data. In the model, a progression of variable strength Fermi resonances is postulated to occur between pairs of vibrational subbands that differ by ν_3-$2\nu_2$-$(2\nu-1)x_{33}$ rather than between members of the usual overtone progression. The model is seen to accurately describe the experimental data. (25 refs.)

106499 Angle-resolved photoelectron spectroscopy of HCl from a photon energy of 16 to 80 eV. T.A.Carlson, M.O.Krause, A.Fahlman (Chem. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), P.R.Keller, J.W.Taylor, T.Whitley, F.A.Grimm.
J. Chem. Phys. (USA), vol.79, no.5, p.2157-62 (1 Sept. 1983).
Angle-resolved photoelectron spectroscopy was performed on HCl using synchrotron radiation over a photon energy from 16 to 80 eV. The partial cross sections and angular distribution parameters β were obtained for photoionization of both the 2π and 5σ orbitals. Multiple scattering $X\alpha$ calculations were also carried out for the cross sections and β values. The calculations, together with previously published results on the cross section using a Hartree-Fock model, were compared with experiment and gave reasonable qualitative agreement. Both experimental and theoretical results were examined with particular regard to the nature of the Cooper minimum and the differences between the behavior of the minima for the two orbitals are discussed in detail. (12 refs.)

106500 Calculation of photoelectron spectra of group IV tetrachlorides and carbon tetrahalides by SCF-X_α-SW method. J.K.Zhu, D.Li, J.Li, Y.-K.Pan (Dept. of Chem., Boston Coll., Chestnut Hill, MA, USA).
Theor. Chim. Acta (Germany), vol.63, no.3, p.223-33 (1983).
Photoelectron spectra and one-electron eigenfunctions of group IV tetrachlorides, ACl_4, where A=C, Si, Ge, Sn and carbon tetrahalides, CB_4, where B=F, Cl, Br, I, have been calculated by SCF-X_α-SW method. Excellent agreement is obtained with the observed photoelectron spectra. The radius reduction factors of atomic sphere F_r were adjusted instead of changing individual atomic radii. The comparison of photoelectron spectra and ene-electron eigenfunctions for molecules ACl_4 for different central atoms A and halogen atoms B is discussed. (20 refs.)

33.70 INTENSITIES AND SHAPES OF MOLECULAR SPECTRAL LINES AND BANDS

106501 Experimental study of chlorine donors for the triatomic exciplex Xe_2Cl. G.Marowsky (Max Plank-Inst. fur Biophys. Chem., Gottingen, Germany), F.K.Tittel, W.L.Wilson,Jr., R.Sauerbrey.
AIP Conf. Proc. (USA), no.100, p.334-40 (1983). (Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983).
The influence of various chlorine donors, specifically CCl_4, Cl_2 and HCl, on the formation and decay of the trimer Xe_2Cl^* has been studied experimentally for electron beam-excited mixtures of argon, xenon and various halogen donors. Quenching rates of the trimer fluorescence for each donor have been determined. A radiative lifetime for Xe_2Cl^* for 210 ± 25 ns was measured. (15 refs.)

106502 Homogeneous linewidth and optical dephasing of the $S_1 \leftarrow S_0$ transition of magnesium porphin in an *n*-octane crystal: a study by transient and photochemical hole-burning. A.I.M.Dicker, L.W.Johnson, S.Volker, J.H.van der Waals (Gorlaeus and Huygens Lab., Univ. of Leyden, Leyden, Netherlands).
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.8-14 (26 Aug. 1983).
Transient and photochemical hole-burning is used to determine the homogeneous linewidths of the $S_x \leftarrow S_0$ and $S_y \leftarrow S_0$ transitions of a magnesium porphin-pyridine complex in four sites of n-octane ($T=1.2$-$4.2K$). Thermally induced dephasing of $S_x \leftarrow S_0$ is consistent with 'exchange' to low-frequency local modes identified in the spectra. The relaxation time of S_y varies from ≈ 2 to 4 ps from site to site. (31 refs.)

106503 Air broadened NO linewidths in a temperature range of atmospheric interest. J.P.Houdeau, C.Boulet (Dept. de Phys. Atomique et Moleculaire, Univ. de Rennes, Rennes, France), J.Bonamy, A.Khayar, G.Guelachvili.
J. Chem. Phys. (USA), vol.79, no.4, p.1634-40 (15 Aug. 1983).
Self- and N_2-broadened linewidths of NO in the 5.4 μm band have been measured at 163 and 295K using high resolution Fourier transform spectroscopy. These linewidths have been calculated using the formalism of Robert and Bonamy (1979). The calculated values are in good agreement with the experimental one. Therefore, the same formalism can be reasonably used in order to calculate O_2-broadened widths which cannot be easily measured. Air-broadened linewidths calculations have been performed in the temperature range [163-295K]. From the results the J dependence of the exponent $m(J)$ which gives the temperature dependence of the widths, according to the power law $\gamma(T)=\gamma(T_0)(T/T_0)^{-m(J)}$ has been established. (30 refs.)

106504 NaH: studies of the $X^1\Sigma^+$ state near dissociation and of the radiative lifetimes and collision cross sections of the $A^1\Sigma^+$ state. O.Nedelec, M.Giroud (Lab. de Spectrometrie Phys., Univ. Sci. et Medicale de Grenoble, Saint Martin d'Heres, France).
J. Chem. Phys. (USA), vol.79, no.5, p.212-5 (1 Sept. 1983).
With a dye laser pumped by an excimer laser, the NaH $A^1\Sigma^+$ state has been excited up to $\nu'=21$. Its decay to the $X^1\Sigma^+$ ground state has been observed up to $\nu''=19$, a vibrational level close to the dissociation limit, allowing the authors to obtain a precise value of the $X^1\Sigma^+$ dissociation energy: $D_e=15\,785\pm20$ cm^{-1}. For $\nu''>15$, the vibrational spacings and the rotational constants decrease very rapidly, as also observed recently in CsH, due to a sudden change of configuration mixing. The $A\ ^1\Sigma^+$ radiative lifetimes do not vary appreciably from $\nu'=3$ to $\nu'=18$, $\tau=287\pm2$ ns, but increase to 35 ± 2 ns at $\nu'=21$. The quenching and rotational transfer collision cross sections of the $A^1\Sigma^+$ state with H_2 have nearly the same values for a given ν'. They increase from $\nu'=4$ to $\nu'=21$ as do the calculated electric dipole moments and the geometric extent of the levels. (28 refs.)

106505 Temperature dependence of air and oxygen broadening coefficients of O_3. A.Barbe, P.Marche, C.Meunier, P.Jouve (Lab. de Phys. Moleculaire, Faculte des Sci., Reims, France).
J. Phys. (France), vol.44, no.9, p.1015-17 (Sept. 1983). In French.
The authors have recorded the spectra of O_3 broadened by O_2 and dry air in the 5 μm region, at different temperatures from 296K to 171K. From these data, they deduce the values of pressure-broadened linewidths of O_3 at these temperatures. Writing $\alpha_0{}^L(T)=\alpha_0{}^L(T_0).(T_0/T)^n$, they deduce $n=1.3\pm0.2$ for dry air. (8 refs.)

106506 Pressure broadening theory of assymetric-top molecules using the methods of irreducible tensor operators. M.N.Moazzen-Ahmadi, J.A.Roberts (Dept. of Phys., North Texas State Univ., Denton, TX, USA).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.3, p.229-43 (Sept. 1983).
Contributions to the second-order collision efficiency function used in Anderson (1974) and Murphy-Boggs (1967) pressure-broadening theories due to dipole-dipole, dipole-quadrupole, quadrupole-dipole, and quadrupole-quadrupole interactions are derved by the method of irreducibly spherical tensor operators for molecules of arbitrary symmetry. Results are given explicitly in terms of dipole and quadrupole line strengths. General expressions for dipole line strength in the asymmetric rotor basis, as well as quadrupole moment line strength for the special case of molecules with two independent quadrupole moment components, are derived. (12 refs.)

106507 Intensity measurements in the (A-X) band system of CO. U.D.Prahllad, N.S.Murthy (Dept. of Phys., Univ. of Mysore, Mysore, India).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.250-4 (1983).
Relative integrated intensities of 18 bands of the CO 4th positive ($A^1\mathit{II}$-$X^1\Sigma^+$) band system have been measured by photographic photometry. The variation of the electronic transition moment $R_e(r)$ with the internuclear separation r has been found to be $R_e(r)=\text{constant}\times(0.757r-1)$ in the range 1.456 Å$\leq r\leq$1.575 Å. Smoothed relative band strengths and the effective vibrational temperature of the source are derived. (20 refs.)

33.80 PHOTON INTERACTIONS WITH MOLECULES

106508 . On certain new apsects of the process of multiphoton excitation in polyatomic molecules. S.Rashev (Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.5, p.599-601 (1983).
In recent years IR multiphoton excitation (MPE) in polyatomic molecules has aroused much experimental as well as theoretical interest. This enhanced interest is due to its practical implications (isotopically selective multiphoton dissociation (MPD), bond selective laser chemistry etc.) as well as to the possibilities opened up for a deeper insight into the properties of highly excited vibrational levels of the ground electronic state. In order to describe theoretically the population distribution among excited vibronic levels in the quasicontinuum (QC) of a polyatomic molecule, obtained in the course of laser irradiation (in the monomolecular regime), the kinetic equations technique is practically the sole accessible method. The kinetic equations technique is based on certain assumptions about the density of vibronic levels and the IR absorption cross section as functions of excitation energy. After some elaboration the method of description can be reduced to yield a partial differential equation describing the excitation process. (7 refs.)

33.80B Level crossing and optical pumping

106509 XUV excitation of H_2 using the third harmonic or a frequency-double dye laser. C.T.Rettner, E.E.Marinero, R.N.Zare (Dept. of Chem., Stanford Univ., Stanford, CA, USA), A.H.Kung.
AIP Conf. Proc. (USA), no.100, p.345-8 (1983). (Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983).
Frequency tripling a doubled dye laser in a pulsed argon source has produced $\sim10^{10}$ photons/pulse, permitting excitation of H_2 between 973 and 1023 Å. (4 refs.)

106510 Non-adiabatic approximation for resonant multiphoton excitation of vibrational-rotational states in strong laser fields. S.-I.Chu, T.-S.Ho, J.V.Tietz (Dept. of Chem., Univ. of Kansas, Lawrence, KS, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.422-6 (19 Aug. 1983).
A method is presented for efficient and accurate treatment of infrared multiphoton absorption (MPA) processes in strong fields. By means of adiabatic separation of the fast vibrational motion from the slow rotational motion, one first solves the quasi-vibrational energy states (QVESs) with molecular orientation fixed. This reduces the computationally often formidable Floquet matrix analysis to a manageable scale. One then introduces non-adiabatic angular couplings of the adiabatic QVESs for proper analysis of resonant MPA. The utility of the method is illustrated by a study of the non-linear MPA quantum dynamics in CO. (10 refs.)

33.80E Autoionization, photoionization, and photodetachment

106511 Resonance-enhanced multiphoton ionization (2+1) of the $\tilde{B}$ and $\tilde{C}'$ states of ammonia. R.J.Stanley, O.Echt, A.W.Castleman,Jr. (Dept. of Chem., Pennsylvania State Univ., University Park, PA, USA).
Appl. Phys. B (Germany), vol.B32, no.1, p.35-8 (Sept. 1983).
Resonance-enhanced multiphoton ionization (REMPI) of the $\tilde{B}$ and $\tilde{C}'$ states of NH_3 in a pulsed supersonic molecular beam was observed at 304-340 nm, using the multiphoton-ionization mass-spectrometer system described herein. The observed features are the result of a 2+1 MPI process and correspond quite well with the reported 3+1 MPI of NH_3 in the literature from the ground state of opposite parity. (8 refs.)

106512 Autoionizing Rydberg states of the Li_2 molecule: molecular constants for $Li_2{}^+$. M.W.McGeoch, R.E.Schlier (Avco Everett Res. Lab. Inc., Everett, MA, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.347-52 (12 Aug. 1983).
Autoionizing Rydberg series of Li_2 have been observed in the two-step optical excitation of a supersonic lithium beam. The series limits are vibrational states of $Li_2{}^+$. In the most probable assignment $IP(Li_2)=41236.4\pm2.5$ cm^{-1} and for $Li_2{}^+$ $\omega_e=263.45\pm1.3$ cm^{-1}; $\omega_e x_e=1.35\pm0.2$ cm^{-1}; $r_e=3.032\pm0.01$ Å; $D_e=10807\pm150$ cm^{-1}. (12 refs.)

106513 Resonance by the complex coordinate method with Hermitean Hamiltonian. N.Moiseyev (Dept. of Chem., Technion-Israel Inst. of Technol., Haifa, Israel).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.364-7 (12 Aug. 1983).
Using the complex coordinate method, a new hermitean hamiltonian is formulated, in which the resonance position and width are the 'natural' perturbation strength parameters. If the resonance position is known the resonance width obtained by the presented theory is a lower bound to the exact value. (14 refs.)

106514 State-selective resonant excitation-ionization of H_2 with tunable VUV laser light. H.Rottke, K.H.Welge (Fakultat fur Phys., Univ. Bielefeld, Bielefeld, Germany).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.456-60 (19 Aug. 1983).
State-selective resonant two-phonon ionization of molecular hydrogen with the $B\ ^2\Sigma_u{}^+(\nu'=0,J')\leftarrow X\ ^1\Sigma_g{}^+(\nu''=0,J'')$ transition as resonant step in the wavelength region 1108-1116 Å has been performed with tunable VUV laser light. Two experimental arrangements have been employed, one with a quadrupole mass spectrometer and the other with an ionization cell arrangement. With presently available tunable VUV laser intensities a state-selective detection sensitivity of $\approx10^{-10}$ Torr H_2 can be achieved. (21 refs.)

106515 Ultraviolet laser induced ionization of molecules near surfaces. R.B.Opsal, J.P.Reilly (Dept. of Chem., Indiana Univ., Bloomington, IN, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.461-4 (19 Aug. 1983).
Aromatic molecules are multiphoton ionized in the source region of a time-of-flight mass spectrometer using the output from a KrF excimer laser. Under certain operating conditions unusually sharp mass spectral peaks are observed. It is demonstrated that these result from ionization of molecules initially adsorbed to a metal surface. The implications of this phenomenon are briefly discussed. (14 refs.)

106516 Photoabsorption and photoionization of HD. P.M.Dehmer (Argonne Nat. Lab., Argonne, IL, USA), W.A.Chupka.
J. Chem. Phys. (USA), vol.79, no.4, p.1569-80 (15 Aug. 1983).
Relative photoabsorption and photoionization cross sections have been measured for HD at a temperature of 78K in the wavelength region from 735 to 805 Å. The present wavelength resolution of 0.016 Å represents an improvement of more than two orders of magnitude over that of previous photoionization studies of this molecule. Bands of the $3p\pi\ D\ ^1\Pi_u\leftarrow X^1\Sigma_g{}^+$ system are observed to $\nu'=17$, and ionization efficiencies are reported for a

number of Rydberg states of low principal quantum number. As in the case of H_2, the ionization efficiency is close to unity for Rydberg states that can autoionize with $\Delta\nu=-1$, but drops to zero for states that can autoionize only with a large change in vibrational quantum number and that are significantly predissociated (such as the $3p\pi D^1\Pi_u$ state). The breakdown of (g,u) symmetry in HD and the resulting effects on the absorption spectrum and on the decay paths of the Rydberg states are discussed. (62 refs.)

106517 Relative intensities in X-ray photoelectron spectra. X. Near-threshold structure of photoionization cross-sections of molecular valence shells. M.M.Gofman, V.I.Nefedov (Inst. of General & Inorganic Chem., Acad. of Sci., Moscow, USSR), V.L.Kraizman, R.V.Vedrinski.
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.1, p.59-72 (Aug. 1983).
For pt.IX see ibid., vol.27, p.109 (1982). A method is described for the calculation of photoionization cross-sections of molecular orbitals using atomic cross-sections. The method is an extension of the additive scheme, and allows description of the resonance structure of the cross-sections, taking into account multiple scattering of photoelectrons by the molecular potential. Calculated photoionization cross-sections for the valence levels of N_2, CO and SF_6 are presented for excitation energies ranging from the ionization threshold to 50 eV. The results are compared with the near-threshold structure in the corresponding X-ray absorption spectra. (33 refs.)

106518 Pade-approximant corrections to general variational expressions of scattering theory: application to 5σ photoionization of carbon monoxide. R.R.Lucchese (Dept. of Chem., Princeton Univ., Princeton, NJ, USA), V.McKoy.
Phys. Rev. A (USA), vol.28, no.3, p.1382-94 (Sept. 1983).
The authors discuss a method for systematically correcting results obtained using variational expressions in scattering theory. The approach taken is to compute a sequence of Pade approximants of the form $[N/N]$ for the error in an initial variational estimate obtained using a basis-set expansion. The relationship between the Pade-approximant approach and the iterative Schwinger method for correcting variational estimates is also examined. The authors discuss a large class of general variational expressions to which the Pade-approximant approach can be applied. The variational expressions considered include those for the wave function, for photoionization transition matrix elements, as well as for scattering matrix (K-matrix) elements. The authors have applied this approach to the 5σ photoionization of CO using the frozen-core Hartree-Fock and fixed-nuclei approximations. The authors find that the Pade-approximant method converges rapidly and reliably. Both total photoionization cross sections and photoelectron angular distributions from threshold to 40 eV are presented and compared to previous experimental and theoretical results. The authors find major quantitative discrepancies between the present results for the total cross section and previous theoretical results. (44 refs.)

106519 Infrared multiphoton excitation: energy distribution of reacting molecules from overtone excitation studies. S.Ruhman, O.Anner, S.Gershuni, Y.Haas (Dept. of Phys. Chem., Hebrew Univ. of Jerusalem, Jerusalem, Israel).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.281-6 (12 Aug. 1983).
A method is offered to estimate quantitatively the energy distribution of molecules reacting after being excited by multiphoton absorption of infrared radiation. The method is based on the comparison of the real time reaction kinetics obtained in the infrared multiphoton experiment with those observed upon excitation of a vibrational overtone. Results obtained for the dissociation of tetramethyldioxetane under low-pressure conditions are used as a demonstration. (16 refs.)

106520 Time resolved observations of NH_2 and benzyl radicals produced in the infrared multiple photon dissociation of benzylamine. H.Reisler, F.B.T.Pessine, C.Wittig (Chem. Dept., Univ. of Southern California, Los Angeles, CA, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.388-93 (19 Aug. 1983).
The average internal energy of benzylamine molecules dissociated via infrared multiple photon excitation is derived from laser induced fluorescence (LIF) measurements of $[NH_2]$ versus time, and is 50-70 kcal mol^{-1} above threshold at fluences of 10-30 J cm^{-2}. The benzyl radical is monitored by LIF and is produced vibrationally 'hot'. Fluorescence lifetimes of bands in its $1^2A_2 \to 1^2B_2$ system are reported. (30 refs.)

106521 Photofragmentation of nitromethane in a molecular beam at 193 nm. N.C.Blais (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1723-31 (15 Aug. 1983).
The author reports the cross section for dissociation of nitromethane at 193 nm. It is $(1.7\pm1.0)\times10^{-17}$ cm^2 measured relative to that for $H\,^{79}Br$. From this, he infers that the quantum yield for the process is nearly unity. Photofragments of the dissociation were observed at masses 15, 16, and 30 corresponding to CH_3, O, and NO, but only a very small amount of fragments at mass 46 (NO_2) was measured. Time-of-flight spectra were obtained for all fragments except for mass 46. The data is explained by assuming that two sequential absorptions of photons occur. The first photon dissociates CH_3NO_2 to CH_3 and NO_2. The second photon is absorbed by the NO_2 fragment to give NO+O. About 30% of the NO_2 participate in the second absorption and the rate determining step is the primary absorption. The primary absorption fragments are characterized by having a most probable kinetic energy of 7% of the maximum available energy with an average of 19%. The remainder of this energy appears as internal energy of the fragments which can include electronic excitation of NO_2 to the A^2B_2 state or even to further dissociation of NO_2 to NO+O. (29 refs.)

106522 A classical theory of multiple photon dissociation. D.A.Jones, I.C.Percival (Dept. of Appl. Math., Queen Mary Coll., London, England).
J. Phys. B (GB), vol.16, no.16, p.2981-96 (28 Aug. 1983).
The authors consider the absorption of energy from a laser by a molecule that has been excited into the lower quasi-continuum, with particular reference to SF_6 The theory is analytic and purely classical, following the general prescription of E.V. Shuryak. They find stochastic energy absorption, but of a different magnitude from that of Shuryak. The energy diffusion constant is independent of the applied field, in disagreement with experiment. This disagreement is unlikely to be due to quantal effects. They find that if rotation is incorporated into the original model, the picture is completely changed and there is an explicit dependence of diffusion on field strength, but no detailed analysis is available. (45 refs.)

106523 Ultraviolet photodissociation of $Xe_2{}^+$ and $Kr_2{}^+ 1(^1/_2)_u$: detection of rare-gas dimer ions in real time. A.W.McCown, M.N.Ediger, S.M.Stazak, J.G.Eden (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1440-5 (Sept. 1983).
Momentary depletion of the $Xe_2{}^+$ (or $Kr_2{}^+$) $1(^1/_2)_u$ population is observed by photodissociating the molecule at 351.1, 337.1, or 307.9 nm [on the $1(^1/_2)_u \to 2(^1/_2)_g$ band] and monitoring the temporally resolved emission from the dissociative-recombination fed neutral Xe line at 828.0 nm ($6p[^1/_2]_0 \to 6s[^3/_2]_1$). Near total suppression (>90%) of the Xe ($6p \to 6s$) fluorescence is obtained for laser intensities of 50 MW cm^{-2}. Measurements of the absolute electron density confirm that this effect is due to depletion of the dimer-ion concentration rather than photoionization of the $6p[^1/_2]_0$ state. However, photoionization of the Xe ($6s'$ or $6p$) levels is observed and the cross section is measured to be 2.3×10^{-18} cm^2 at 351 nm. These experiments demonstrate a means for studying the collisional kinetics of rare-gas dimer ions in real time and in the presence of large background gas pressures. (26 refs.)

34.00 ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS

34.20 INTERATOMIC AND INTERMOLECULAR POTENTIALS AND FORCES

(for molecular solids, see 31.70K)

106524 Comments on energy minimization in subspaces of coordinates and on 'chemical hysteresis'. I.Balint, M.I.Ban (Inst. of General & Phys. Chem., Attila Jozsef Univ., Szeged, Hungary).
Int. J. Quantum Chem. (USA), vol.24, no.2, p.161-7 (Aug. 1983).
Using partial minimization of the potential energy function, the determination of the points of the reaction path does not often lead to unambiguous results. The reason is that the subspace of the coordinate where the minimization takes place cannot be arbitrarily chosen. (6 refs.)

106525 Long-range forces in heavy particle scattering. D.J.Baker, D.R.Flower (Phys. Dept., Univ. of Durham, Durham, England).
J. Phys. B (GB), vol.16, no.17, p.L515-19 (14 Sept. 1983).
The authors examine the applicability of asymptotic series expansions, of the type introduced by Gailitis (1976) to problems in heavy particle scattering. The convergence of the solutions, with respect to the value of the scattering coordinate, is found to be greatly improved in a model problem of the rovibrational excitation of H_2 by H^+. (6 refs.)

106526 Perturbation calculations of the interaction energy between closed-shell Hartree-Fock atoms. The neon dimer. G.Chalasinski (Theoretical Chem. Group, Univ. of Utrecht, Utrecht, Netherlands).
Mol. Phys. (GB), vol.49, no.6, p.1353-73 (20 Aug. 1983).
Interaction energy between two neon atoms described by the Hartree-Fock wavefunctions has been calculated through the second order of the symmetry-adapted perturbation theory. Particular contributions, the first order energy, dispersion, induction, exchange-dispersion and exchange-induction energies, are analysed and the basis set effects are discussed. The calculated values of the interaction energies are close to the experimental energies. (72 refs.)

106527 Repulsive van der Waals and dipole-quadrupole interaction in the excited LiCs molecule. C.Vadia, C.-J.Lorenzen, K.Niemax (Inst. fur Experimentalphys., Univ. Kiel, Kiel, Germany).
Phys. Rev. Lett. (USA), vol.51, no.11, p.988-91 (12 Sept. 1983).
The authors report strong repulsive van der Waals and dipole-quadrupole interactions in the Σ and Π potentials of the LiCs molecule dissociating into Li $2P$ and Cs $6S$ atoms. Theoretical results derived from second-order perturbation theory are verified by investigating experimentally the

wavelength dependence of the quasistatic wings of the Li resonance lines broadened by Cs ground-state atoms. (14 refs.)

106528 Potential energy functions for diatomic molecules. E.I.Toader, A.Dumitrescu (Faculty of Phys., Univ. of Bucharest, Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.6, p.499-506 (1983).
Using the criteria a good diatomic potential function must satisfy and the experimental constants to fit the potential curve, six semiempirical potential-energy functions are reported. The comparison of these potential-energy functions with the potential function for $^1\Sigma_g{}^+H_2$, constructed from the points calculated by Kolos and Wolnievicz (1965), shows that the sixth function of this paper, which has a high degree of versatility, seems also to be a suitable function for other diatomic molecules. (8 refs.)

34.40 ELASTIC SCATTERING OF ATOMS AND MOLECULES

106531 Zero-angular-momentum resonances in atom-atom collisions. S.Bosanac (R. Boskovic Inst., Zagreb, Yugoslavia).
Phys. Rev. A (USA), vol.28, no.3, p.1344-56 (Sept. 1983).
In elastic atom-atom collisions resonances can be formed even for zero angular momentum, provided that the potential has a barrier. It is shown that their contribution in the cross section is much larger than expected from their energy width. This is due to an unusually large broadening effect in the angular momentum variable which only occurs for zero-angular-momentum resonances. The broadening effect in the partial waves is analyzed, and it is shown how such resonances affect the cross sections. (21 refs.)

106532 Electron loss cross sections for He^+ and He incident on N_2 and O. S.A.Haider, R.P.Singhal (Appl. Phys. Section, Inst. of Technol., Banaras Hindu Univ., Varanasi, India).
Physica B & C (Netherlands), vol.121B+C, no.3, p.437-40 (Aug. 1983).
Electron loss cross sections for He^+ and He incident on molecular nitrogen and atomic oxygen are calculated using the free collision model. Accurate analytical expressions for differential elastic cross sections needed in the free collision model have been used. Good agreement with available experimental data is found at high impact energies when the free collision model is applicable. (13 refs.)

34.50 INELASTIC SCATTERING OF ATOMS AND MOLECULES

106533 Collision experiment on highly ionized ions using a vacuum spark source. S.Takagi, S.Ohtani, K.Kadota, J.Fujita (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.539-44 (1 Aug. 1983).
Cross sections for one-electron capture by Fe^{6+} in H_2 have been measured at collision energies below 10 eV by using a vacuum spark ion source. It is found that the cross sections are little dependent on the collision energy and their values are around 6×10^{-15} cm^2. This ion source, which has no electrode for ion extraction, can produce multicharged ions from several hundreds of eV to several tens of keV and the maximum charge state of 16 in Fe at the discharge energy of 125 J (capacitor: 10.4 μF, operation voltage: 5 kV). With an ion selection system of 2.7 m time-of-flight and a 127° electrostatic analyzer of 1% resolving power 10^2-10^3 ions/pulse are obtained. Because of the poor reproducibility of the discharge, ions which have captured an electron from the target molecule and ions which have not reacted, are measured simultaneously during one discharge with a microchannel plate which has two collectors at the back. (21 refs.)

106534 Ion energy-loss spectroscopy of Kr^{2+}-He and -Ne collisions. I. Transitions among $^3P_2$, $^3P_1$, $^3P_0$, $^1P_2$ and $^1S_0$ or Kr^{2+}. N.Kobayashi, T.Nakamura, Y.Kaneko (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2684-91 (Aug. 1983).
Excitation and de-excitation among low-lying states of Kr^{2+}, $^3P_2$, $^3P_1$, $^3P_0$, $^1D_2$ and $^1S_0$, in the collisions with He and Ne are studied in the energy range from 0.5 to 2.7 keV using a high resolution ion energy-loss spectrometer. The primary Kr^{2+} beam is extracted from an electron-impact ion source and the fractional populations of these states are determined as a function of the impact energy for electrons from 80 to 400 eV. The measured fractions are different from those expected from the statistical model. The fractional populations of the metastable states, $^1D_2$ and $^1S_0$, increase monotonously with the increase of the electron energy up to the highest energy studied. The cross sections for the $^3P_2\rightleftarrows{}^3P_1$, $^3P_2\rightleftarrows{}^3P_0$, $^3P_{0,1}\rightleftarrows{}^1D_2$ and $^1D_2\rightleftarrows{}^1S_0$ transitions are evaluated from the intensities of the inelastic and primary peaks observed at angle 0°. (12 refs.)

106535 Relativistic binary-encounter collision and stopping theory: general expressions. A.L.Tofterup (Fysisk Inst., Odense Univ., Odense, Denmark).
J. Phys. B (GB), vol.16, no.16, p.2997-3003 (28 Aug. 1983).
An expression for the energy transfer between two particles moving with relativistic velocities has been given on the basis of a binary-encounter description of elastic scattering. By means of a Lorentz transformation of the differential scattering cross section in the center-of-mass system the differential cross section and the total cross section have been established for relativistic particle velocities. Expressions have been derived that relate stopping power and straggling for a projectile penetrating a medium in internal motion to the stopping parameters of a medium at rest. These expressions contain the velocity distribution of target particles, kinematic factors and the Moller speed. (18 refs.)

106536 Interference effects in photon emission excited in collisions between identical atoms. G.Nienhuis (Fysisch Lab., Rijksuniv. Utrecht, Utrecht, Netherlands).
J. Phys. B (GB), vol.16, no.17, p.L509-15 (14 Sept. 1983).
The author evaluates interference effects arising in the photon emission excited by collisions between identical atoms. The general cause of the interference is the coherent superposition of radiation emitted by either one of the atoms. The author briefly discusses the relevance of these effects in several experimental situations of practical interest. (6 refs.)

106537 Proton affinity of GeH_4 and the shape of $GeH_5{}^+$. S.Kohda-Sudoh (Dept. of Chem., Hirosaki Univ., Hirosaki, Japan), S.Ikuta, O.Nomura, S.Katagiri, M.Imamura.
J. Phys. B (GB), vol.16, no.17, p.L529-31 (14 Sept. 1983).
The structure of $GeH_5{}^+$ is a complex of $GeH_3{}^+ + H_2$ with C_s symmetry. The proton affinity is calculated to be 7.3 eV. The obscure nature of $GeH_5{}^+$ is elucidated by its small dissociation energy 7.6 kcal mol^{-1} into $GeH_3{}^+ + H_2$. (11 refs.)

106538 Charge-changing cross sections for 1-70-keV H^+ and H^0 in collisions with calcium and strontium metal vapors. M.Mayo, J.A.Stone, T.J.Morgan (Phys. Dept., Wesleyan Univ., Middletown, CT, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1315-21 (Sept. 1983).
Absolute electron-transfer cross sections have been measured for H^+ and H^0 in collisions with Ca and Sr metal vapor targets for energies between 1 and 70 keV. The measurements include cross sections for single- and double-electron capture by H^+ and single-electron capture and loss by H^0. The single-electron capture cross section for H^+ incident has been calculated using the binary-encounter approximation, and agrees with experiment to within a factor of 2 for energies between 2 and 70 keV. The electron-detachment cross section for H^- in collisions with Ca and Sr is determined from the present measured data and previously measured charge-state equilibrium fractions. The high- and low-energy structure in the cross sections for single- and double-electron capture by H^+ are discussed in terms of the importance of inner-shell capture at high energies and a molecular picture at low energies, and the cross sections are compared to those for Mg and Ba targets published in a previous paper. The cross section for single-electron capture by H^0 rises at low energies; that for electron detachment from H^- decreases at low energies in agreement with theoretical predictions of Olson and Liu (1979). This situation is discussed as the mechanism responsible for large negative-ion equilibrium yields at low energies for alkaline-earth targets. (28 refs.)

106539 Collisional broadening of nonlinear optical resonances. V.P.Chebotayev, L.S.Vasilenko (Inst. of Thermal Phys., Novosibirsk, USSR).
Prog. Quantum Electron. (GB), vol.8, no.2, p.79-114 (1983).
Discusses the results of experimental studies of collisions by new superhigh resolution spectroscopic methods and considers in detail the influence of velocity changing collisions on the shape of the resonance. (99 refs.)

106540 Angular correlation studies of heavy-particle impact excitation of atoms. K.Blum (Inst. fur Theoretische Phys. I, Univ. Munster, Munster, Germany), H.Kleinpoppen.
Phys. Rep. (Netherlands), vol.96, no.5, p.251-316 (June 1983).
A review is given of recent developments of angular correlation studies of heavy-particle impact excitation of atoms and molecules. After a brief discussion of the basic principles of experimental methods a theory of measurement of angular correlations from heavy-particle atom collisions is outlined in the following way. By applying angular correlation measurements a subensemble from the collision processes is selected which is described by state and scattering parameters. These parameters (scattering amplitudes and their phases, alignment and orientation, state multipoles and coherence parameters) can be connected with the experimental angular correlation data. Results from heavy-particle angular correlations have been discussed in separate sections with ions or atoms as projectiles; subsections are dealing with charge exchange excitation, excitation of autoionizing states direct and simultaneous excitation of target and projectile particles. The angular correlation parameters are very sensitive to the detailed excitation mechanisms and quasi-molecular parameters in heavy-particle atom collisions. The majority of data available so far were obtained from simple projectile-target systems such as one-electron atom systems and rare gas atoms. Attention is drawn to possible spin-orbit effects in the analysis of angular correlations from collisions between very heavy atomic particles. (96 refs.)

34.50E Rotational and vibrational energy transfer

106541 Calculation of differential cross sections for rotational excitation in D_2+CO collisions at 87.2 meV. G.D.Billing, L.L.Poulsen (Dept. of Chem., Panum Inst., Univ. of Copenhagen, Copenhagen, Denmark).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.368-71 (12 Aug. 1983).
Differential cross sections for rotational excitation in D_2+CO collisions are calculated at six scattering angles using an electron gas surface and a semi-classical scattering theory in which the translational and the rotational motion of CO are treated classically whereas the D_2 rotation is quantized. (7 refs.)

106542 Collisional redistribution of weak radiation and the factorization approximation. K.Burnett (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).
Comments At. & Mol. Phys. (GB), vol.13, no.4, p.179-85 (1983).
Describes recent work on the collisional redistribution of weak radiation in dilute gases. This work has dealt with the finite duration of collision effects in the statistical problem of light scattering by atoms undergoing collisions with foreign atoms. It has provided a basis for redistribution functions valid from the line core far into the wing—including the effects of simultaneous radiative and inelastic collisional events—and has also pointed the way to experiments where the details of inelastic collision dynamics can be studied by light scattering. (59 refs.)

106543 Breathing-sphere quantum calculations of integral and differential cross sections for vibrational excitation in ion (atom)-diatom collisions. G.Drolsgagen, J.P.Toennies (Max-Planck Inst. fur Stromungsforschung, Gottingen, Germany).
Chem. Phys. (Netherlands), vol.79, no.2, p.159-77 (1 Sept. 1983).
Pure vibrational excitation cross sections for a large number of ion (atom)-diatom collision systems are calculated using the breathing-sphere approximation. A realisitic spherical potential adapted from the SCF potential calculated and fitted by Lester for $Li^+ + H_2$ is used for all systems. The effect of the collision energy from threshold up to the equivalent of 30 vibrational quanta and the effect of the masses of the incoming atom (1-133 amu) and target molecule (2-160 amu) on the integral inelastic cross sections is studied systematically. In another set of calculations the effect of 10% variations of various potential parameters on the excitation cross sections is examined and discussed in terms of potential range effects and vibrational coupling. Vibrationally inelastic differential cross sections for the system $Li^+ + H_2$ are calculated at total energies of 1.47, 2.0 and 3.65 eV and for $Li^+ + Br_2$ at 0.074, 0.080, and 0.321 eV. Finally the energy dependence of integral cross sections is compared with the predictions of the Schwartz-Slawsky-Herzfeld (SSH) theory. Despite different potentials the qualitative agreement is good except for vibrational excitation of heavy molecules by light atoms. The energy dependence of integral inelastic cross sections and rate constants for this case are derived from the sudden approximation. (52 refs.)

106544 Semiclassical calculation of energy transfer in polyatomic molecules. X. Energy transfer in $Ar+SF_6$ at 1 eV. G.D.Billing (Dept. of Chem., Panum Inst., Copenhagen, Denmark).
Chem. Phys. (Netherlands), vol.79, no.2, p.179-88 (1 Sept. 1983).
Rotational and vibrational energy transfer in $AR+SF_6$ collisions at 1 eV is calculated as a function of scattering angle. Differential cross sections for the two most excited vibrational modes ν_6 and ν_5 are also reported. (12 refs.)

106545 Collision energy dependence of vibration/rotational distribution of BaBr produced in the crossed beam reaction $Ba+CH_3Br$. T.Munakata, Y.Matsumi, T.Kasuya (Inst. of Phys. & Chem. Res., Saitama, Japan).
J. Chem. Phys. (USA), vol.79, no.4, p.1698-707 (15 Aug. 1983).
The energy disposal in the reaction $Ba+CH_3Br \rightarrow BaBr+CH_3$ was studied as a function of collision energy. The collision energy was controlled in the range from 2.9 and 4.9 kcal/mol by variable acceleration of a supersonic CH_3Br beam which intersected a thermal Ba beam. The internal states of the nascent BaBr were probed by means of the laser induced fluorescence (LIF). Systematic simulations of the observed LIF spectra revealed that an increase of collision energy brought about a drastic decrease of vibrational excitation. The vibrational quantum of maximum population shifted from 12 to 1 in accordance with a collision energy increment of only 2 kcal/mol. Surprisal analysis of the vibrational population suggests that the collision energy increment causes a transition between two reaction paths, one of which leads to vibrationally excited BaBr of maximum population at around $\nu''=12$, and the other, to internally cold CH_3 and statistically excited BaBr. (22 refs.)

106546 Mode-selective cooling of vibrational energy during supersonic expansion of pyrimidine: evidence for noncommunicating sets of vibrational manifold. A.K.Jameson (Dept. of Chem., Loyola Univ. of Chicago, Chicago, IL, USA), H.Salgusa, E.C.Lim.
J. Phys. Chem. (USA), vol.87, no.16, p.3007-9 (4 Aug. 1983).
The authors present evidence for mode-selecting cooling of vibrational energy during supersonic expansion of pyrimidine. The $16a_1{}^1$ sequence band is strongly cooled in the expansion while the $16b_1{}^1$ sequence band is cooled very little. Within the context of a unified physical model for intramolecular and intermolecular energy flow, the observation of mode-selective vibrational cooling implies that intramolecular vibrational energy redistribution may be incomplete even for molecules with large excess vibrational energies. (9 refs.)

106547 Cross-section measurement for the energy-transfer collisions $Na(3P)+Na(3P) \rightarrow Na(5S,4D)+Na(3S)$. M.Allegrini (Istituto di Fisica Atomica e Molecolare, CNR, Pisa, Italy), P.Bicchi, L.Moi.
Phys. Rev. A (USA), vol.28, no.3, p.1338-43 (Sept. 1983).
Reports measurements of the cross sections σ_{5S} and σ_{4D} for the electronic-energy-transfer process $Na(3P)+Na(3P) \rightarrow Na(5S,4D)+Na(3S)$. To obtain these cross sections the authors measured the fluorescence intensity for the transitions $5S \rightarrow 3P$, $4D \rightarrow 3P$, and $3P \rightarrow 3S$ in sodium vapor excited with a CW dye laser. The study of this electronic energy transfer is complicated and there is a large disagreement ($\gtrsim 10^4$) among reported measurements. The authors believe they have avoided most of the difficulties of previous experiments. The results are $\sigma_{5S}=(2.0 \pm 0.7) \times 10^{-15}$ cm^2 and $\sigma_{4D}=(3.2 \pm 1.1) \times 10^{-15}$ cm^{-2}, and they are compared with the results of other experiments. (16 refs.)

34.50H Electronic excitation and ionization (inc. beam-foil excitation and ionization)

106548 The secondary ion mass spectrum of glycerol-d_5: evidence for radical cation intermediates. W.V.Ligon,Jr. (Corporate Res. & Dev., General Electric Co., Schenectady, NY, USA).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.189-93 (1 Sept. 1983).
Particle bombardment of liquid glycerol deuterated on carbon has provided evidence for $(MD)^+$ ion formation via a radical cation intermediate. This discovery has important mechanistic implications for the ionization of compounds dissolved in glycerol. (10 refs.)

106549 Excitation of helium ($1^1S \rightarrow 2^1S$) by proton impact at intermediate and high energies. G.P.Gupta (Dept. of Phys., SD Coll., Muzaffarnagar, India), S.Saxena, K.C.Mathur.
Indian J. Phys. Part B, vol.57B, no.2, p.154-60 (April 1983). [received: Sept. 1983]
The differential and integral cross sections for the $1 1S \rightarrow s^1S$ excitation of helium by proton impact are calculated with incident energy ranging from 100-500 KeV, using the two-potential-modified Born (TPMB) approximation. The computed results are compared with the plane-wave results and the various other theoretical calculations. (13 refs.)

106550 Electronic energy transfer between state selected metastable argon atoms and ground state krypton atoms. T.D.Dreiling, N.Sadeghi (Lab. de Spectrometrie Phys., Univ. Sci. et Medicale de Grenoble, Grenoble, France).
J. Phys. (France), vol.44, no.9, p.1007-13 (Sept. 1983).
The excitation transfer reactions from Ar $(^3P_2)$ and Ar $(^3P_0)$ to Kr were studied in the afterglow of a pulsed discharge. The time decay of the metastable concentrations was monitored to obtain total quenching rate constants for removal of Ar (^3P_J) by Kr. In separate experiments, Ar $(^3P_2)$ was optically depopulated in the afterglow by use of a tunable CW dye laser. Comparison of emission intensities from excited Kr levels with and without laser perturbation was used to assign relative rate constants for excitation of Kr levels by Ar $(^3P_2)$ and Ar $(^3P_0)$. The Kr excitation by Ar $(^3P_2)$ was found to be ~40 times more efficient than by Ar $(^3P_0)$. (20 refs.)

106551 Alignment of the M_3 subshell of Au atoms by proton impact. A.M.Borisov, H.Herkow, V.P.Petukhov, E.A.Romanovsky (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
J. Phys. B (GB), vol.16, no.16, p.L495-8 (28 Aug. 1983).
The alignment parameter of the M_3 subshell of gold has been determined by measurement of the polarisation of X-rays following proton impact ionisation in the 0.1-0.5 MeV energy range. Measurements have shown that the experimental dependence of alignment on collision velocity exhibits an oscillation in the 0.16-0.25 relative collision velocity range. (7 refs.)

106552 Differential scattering in collisions of K^+ ions with Ar atoms. S.Kita, M.Izawa, H.Inouye (Res. Inst. for Sci. Measurements, Tohoku Univ., Sendai, Japan).
J. Phys. B (GB), vol.16, no.16, p.L499-504 (28 Aug. 1983).
Total differential cross sections for K^+-Ar collisions have been measured over a wide range of laboratory scattering angles, $5° \lesssim \theta \lesssim 80°$, and at ion energies 100-350 eV. Beyond an angle of about 45°, unexpectedly high cross sections have been found. The cross sections are attributed to Ar^+ ions produced in charge exchange reactions between K^+ ions and Ar atoms and also through autoionisation of doubly excited Ar^{**} atoms formed in the K^+-Ar collisions. Elastic and inelastic differential cross sections have been analysed by a semi-classical treatment assuming three-state potentials The result shows the inelastic collisions with high probability are caused in the region of the closest approach $R_c \lesssim 1.2$ Å, where the repulsive potential $V(R_c) \gtrsim 41$ eV. (17 refs.)

106553 Crossed-beam measurements of absolute rate coefficients in associative ionisation collisions between Na*(np) and Na(3s) for $5 \leq n \leq 15$. J.Boulmer, R.Bonanno, J.Weiner (Dept. of Chem., Univ. of Maryland, College Park, MD, USA).
J. Phys. B (GB), vol.16, no.16, p.3015-24 (28 Aug. 1983).
Associative ionisation in slow collisions between Na*(np) levels and the Na(3s) ground state is studied in a crossed-beam experiment. Excited levels are prepared by laser photoexcitation, and ionic species are analysed by time-of-flight mass separation. Rate coefficients for associative ionisation, measured for principal quantum numbers ranging from $n=5$ to 15, exhibit a pronounced on n with a maximum of approximately 3×10^{-9} cm^3 s^{-1} near $n=11$. Comparisons are made with the theoretical model developed by Duman and Shmatov, and Mihajlov and Janev. (28 refs.)

106554 Energy pooling process in rubidium vapour. L.Barbier, M.Cheret (Service de Phys. des Atomes et des Surfaces, CENS, Gif Sur Yvette, France).
J. Phys. B (GB), vol.16, no.17, p.3213-28 (14 Sept. 1983).
The 'quasi-resonant' energy pooling process in a rubidium vapour $(Rb(5p^2P_{3/2})+Rb(5p^2P_{3/2})+68\ cm^{-1} \rightarrow Rb(5d)+Rb(5s^2S_{1/2}))$ is experimentally investigated. An asymptotic theoretical model is applied to this reaction and gives a cross section (1×10^{-14} cm^2) close to the experimental value (3×10^{-14} cm^2). The results are discussed together with available data for other alkali atoms. (23 refs.)

106555 Ionisation of atoms by ion impact. D.S.F.Crothers, J.F.McCann (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. Belfast, Belfast, N Ireland).
J. Phys. B (GB), vol.16, no.17, p.3229-42 (14 Sept. 1983).
Total cross sections are calculated for the ionisation of a hydrogen atom by multicharged fully-stripped ions in the 20-1000 keV amu^{-1} impact energy range. Distortion is accounted for in the entrance channel (via the eikonal approximation) and in the exit channel (via the continuum distorted-wave approximation). The transition amplitude is calculated in the post form so that the electronic nonorthogonal kinetic energy is treated as the perturbation. It is concluded that of the currently available models this theory is the most successful and versatile over a considerable range of energies and charges. Specifically for ionisation of a hydrogen atom by 50 keV protons the authors present doubly differential cross sections for electrons ejected in the forward direction and singly differential cross sections as a function of emission

energy. The question of cusps and peaks in the differential cross sections is considered as is the question of charged scaling of the total cross section. (30 refs.)

106556 Ionisation of He atoms by H^+, He^{2+} and Li^{3+} nuclei. V.A.Sidorovich, V.S.Nikolaev (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
J. Phys. B (GB), vol.16, no.17, p.3243-9 (14 Sept. 1983).
The cross sections, σ^{i1} and σ^{i2}, of single and double ionisation of He atoms by H^+, He^{2+}, and Li^{3+} nuclei with energies ranging from 0.01 to 5 MeV amu^{-1} are calculated in the independent-electron approximation. The calculations are made for three versions of the probabilities of one-electron transitions to the continuum. The double ionisation of He by nuclei with energies $E/A \sim 0.1\text{-}Z^2$ meV amu^{-1} is mainly due to the independent interaction of each atomic electron with the bombarding nucleus. The values of σ^{i1} for all nuclei with $E/A \geq 0.2$MeV amu^{-1} and of σ^{i2} for He^{2+} and Li^{3+} nuclei with $E/A=0.2\text{-}0.5$ MeV amu^{-1} calculated in one of the versions are found to agree with the experimental values. The calculated values of σ^{i2} for protons with $E=0.2\text{-}0.7$ MeV and 1.5-4 MeV are respectively higher and lower than the experimental values because the authors calculations were made neglecting the electron correlations. (30 refs.)

106557 Associative ionization in collisions between two Na(3P) atoms. J.Huennekens, A.Gallagher (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1276-87 (Sept. 1983).
The authors measured the rate coefficient [$k=5.6\times10^{-12}$ cm^3/s ($\pm37\%$)] for associative ionization occurring in collisions between two Na($3P$) atoms, by measuring the current resulting from excitation of Na vapor by cw-laser radiation. The major source of uncertainty in measurements of this type is in the determination of the number density and spatial distribution of excited atoms. The authors have measured the excited-atom density by three methods, and have studied the distribution of excited atoms in detail. The rate coefficient at T~650K is compared to other experimental results. (37 refs.)

106558 Total and partial cross sections for electron capture in collisions of hydrogen atoms with fully stripped ions. R.K.Janev, D.S.Belic, B.H.Bransden (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1293-302 (Sept. 1983).
Systematic investigations of charge-transfer reactions $H(1s)+A^{Z+}\rightarrow H^{+}+A^{(Z-1)+}(n,l)(Z^{Z+}$ being a fully stripped ion) within the multichannel Landau-Zener theory with rotational coupling included (MLZRC) are presented. Total cross-section (σ) calculations in the energy region 0.03-80 keV/amu for selected projectiles with charges $5\leq Z\leq 74$ are performed. Oscillations in the Z dependence of σ are observed at low collision energies in the low-Z region. Above this region the Z dependence of σ is linear. The n,l distributions of captured electrons are investigated and results for the partial cross sections σ_n for a number of reactions are presented. The maxima of n distributions appear at $n_m \approx Z^{3/4}$ (in accordance with other theoretical predictions) and have a weak velocity dependence. Validity and limitations of the MLZRC model and the obtained results are discussed. (32 refs.)

106559 Electronic relativistic effects in *K*-shell ionization by proton impact. T.Mukoyama (Inst. for Chem. Res., Kyoto Univ., Kyoto, Japan), L.Sarkadi.
Phys. Rev. A (USA), vol.28, no.3, p.1303-9 (Sept. 1983).
The relativistic plane-wave Born-approximation calculations have been performed for *K*-shell ionization by proton impact. The *K*-shell ionization cross sections have been obtained by the use of relativistic hydrogenic (Dirac) wave functions for target electrons. The ratio of the relativistic cross section to the nonrelativistic one is evaluated and compared with various approximate correction methods for the electronic relativistic effects. Similar comparison is made for the *K*-shell ionization cross sections corrected for binding-energy and Coulomb-deflection effects. These results are also compared with the experimental data. (33 refs.)

106560 Inelastic collisions between selectively excited rubidium 6^2D-state atoms and noble-gas atoms: fine-structure-state mixing. B.G.Zollars, H.A.Schuessler, J.W.Parker, R.H.Hill,Jr. (Dept. of Phys., Texas A&M Univ., College Station, TX, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1329-37 (Sept. 1983).
Inelastic collisional processes in fine-structure-state mixing have been studied by selective stepwise excitation and observation of the resulting fluorescence during collisions of excited rubidium $6^2D_{5/2}$ state atoms with various noble-gas atoms. It is shown that for intermediately excited rubidium atoms the fine-structure-state mixing cross sections are generally increasing from helium to xenon. The cross sections for the process $Rb(6^2D_{5/2})+A(n^1S_0)\rightarrow Rb(6^2D_{3/2})+A(n^1S_0)+\Delta E$ have the values $\sigma_{fs}{}^*=2.4\pm0.9$, 3.1 ± 1.2, 2.6 ± 1.0, 5.8 ± 2.2, and 9.3 ± 5.6 in units of 10^{-14} cm^2, where A denotes in sequence any one of the noble gas atoms He, Ne, Ar, Kr, and Xe, respectively. Transfer cross sections for the transfer of excited $Rb6^2D$-state atoms out of the doublet were also determined and are about an order of magnitude smaller than the fine-structure-mixing cross sections. (45 refs.)

106561 Theory of laser-induced chemi-ionization. I. Quantal formulation. H.P.Saha, J.S.Dahler (Dept. of Chem., Univ. of Minnesota, Minneapolis, MN, USA), S.E.Nielsen.
Phys. Rev. A (USA), vol.28, no.3, p.1487-502 (Sept. 1983).
The quantal theory of field-free associative ionization and Penning ionization, due to O'Malley, Bieniek, and others, is generalized to include the closely analogous laser-induced chemi-ionization processes $A+B+\hbar\omega\rightarrow AB^{+}+e^{-}$, $A+B^{+}+e^{-}$. The principal limitations of the theory are its reliance upon the two-state approximation and its neglect of Born-Oppenheimer terms. Formulas are derived for several scattering cross sections descriptive of the energy spectra and angular distributions of the reaction products. These cross sections vary with the direction of polarization of the laser radiation. The polarization dependences of the heavy-particle ($A+B^{+}$) energy-angle double-differential cross section and of the associated heavy-particle (or photoelectron) energy distribution assume simple cosine-squared forms provided that there is a large number of contributing partial waves. Numerical calculations of these cross sections should be no more difficult to perform than for comparable field-free processes. (12 refs.)

106562 Calculation of proton-impact excitation of the $n=4$ level of atomic hydrogen. B.Barmanry, S.K.Sur, S.C.Mukherjee (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Jadavpur, Calcutta, India).
Phys. Rev. A (USA), vol.28, no.3, p.1813-16 (Sept. 1983).
Differential and integrated cross sections summed over all angular momentum sublevels are calculated for the process $H^{+}+H(n=1)\rightarrow H^{+}+H(n=4)$ in the incident-proton energy range 15-400 keV, employing the Glauber approximation. The integrated cross sections are in very good agreement in curve shape with the available experimental measurement. Results are also presented for the integrated Glauber cross sections for $1s\text{-}4d$ and $1s\text{-}4f$ excitations of hydrogen by proton impact and are compared with available theoretical results. (15 refs.)

106563 Multiple-scattering treatment of the electron-capture to the continuum peak and comparison with experimental results for H^+-He collision. R.O.Barachina, C.R.Garibotti (Inst. Balseiro, Consejo Nacional de Investigaciones Cientificas y Tecnicas, San Carlos de Bariloche, Argentina).
Phys. Rev. A (USA), vol.28, no.3, p.1821-4 (Sept. 1983).
In this work the authors use the first term of a multiple-scattering expansion for the calculation of the distribution of electrons emitted in H^+-He scattering, in a neighborhood of the cusp that corresponds to the electron capture to continuum. The theoretical values that determine the peak shape are compared with recent experimental values at intermediate energies, and the influence of the projectile-target-core interaction in the asymmetry of the peak is discussed. (12 refs.)

106564 Beam-foil study of titanium in the EUV using foils of different materials. S.Bashkin, E.Trabert, P.H.Heckmann, H.von Buttlar, K.Brand (Rhur-Univ. Bochum, Bochum, Germany).
Phys. Scr. (Sweden), vol.28, no.2, p.193-200 (Aug. 1983).
The ultraviolet spectrum (λ8-60 nm) of highly ionized titanium after foil excitation of 15 and 20 MeV fast ions has been recorded. A number of new lines, mainly in sodiumlike Ti XII, are identified. Line intensity ratios and decay curves are measured in selected cases. Using foils of different materials, relative intensities of yrast transitions $n=3\text{-}6$ are evaluated and intercompared with the aid of cascade models. Decay curves of yrast levels are studied for resonance effects in the population mechanism. Little evidence is found for such effects. (39 refs.)

106565 Emission spectra produced from energy transfer reactions of $Ne(^3P_{0.2})$ with N_2O and OCS. M.Tsuji, M.Endoh, H.Obase, Y.Nishimura.
Rep. Res. Inst. Ind. Sci. Kyushu Univ. (Japan), no.74, p.109-113 (1983).
Energy transfer reactions of $Ne(^3P_{0.2})$ with N_2O and OCS have been investigated by UV-visible emission spectroscopy. Penning ionization leading to the $N_2O^+(A^2\Sigma^+)$ state was the only emitting exit channel in the case of N_2O, wherea Penning ionization and excitation transfer were the competitive quenching processes in the case of OCS, producing the $OCS^+(A^2\Pi)$ and $CS(A^1\Pi)$ states, respectively. (12 refs.)

106566 Asymmetry effect in $H^{+}+H^{-}$ neutralization. Application to the $n=3$ pseudocrossing. F.Borondo, A.Macias, A.Riera (Dept. de Quimica Fisica y Quimica Cuantica, Univ. Autonoma de Madrid, Madrid, Spain).
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.63-6 (26 Aug. 1983).
The authors present an extension of previous work on $H^{+}+H^{-}$ neutralization to transitions occurring at the $n=3$ pseudocrossing. Very good agreement with experiment is achieved for energies greater than 500 eV. On the other hand, they conclude that is is difficult to construct a theory explaining the shape of experimental cross sections for energies smaller than 300 eV. (11 refs.)

106567 Charge equilibrium of energetic heavy ions in gaseous media (ideal atomic hydrogen gas). S.Karashima (Dept. of Electrical Engng., Sci. Univ. of Tokyo, Tokyo, Japan), T.Watanabe.
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.895-902 (June 1983).
The charge distribution and its mean values for incident heavy ions are investigated theoretically, the incident heavy ions being treated as they impact and penetrate in an ideal atomic hydrogen gas. The charge on the ions is determined by the equilibrium between electron loss from the ions and electron capture from hydrogen to the ions. Assuming a local balance for electron loss and capture, the charge distribution, the average equilibrium charge, the distribution width, and the asymmetry parameter (skewness) are obtained as functions of the incident velocity. In the estimation of the loss and capture cross sections, some simplification has been made. The scaling law on the above quantities with respect to the atomic number of the incident particles is derived. Practical calculations have been carried out for C, Ne, Ar, Kr, I, and U ions in atomic hydrogen. (13 refs.)

106568 Proton-argon charge transfer cross sections with a realistic electron-target interaction. A.K.Sharma, M.K.Srivastava (Dept. of Phys., Univ. of Roorkee, Roorkee, India).
Indian J. Phys. Part B, vol.57B, no.2, p.119-24 (April 1983). [received: Sept. 1983]
Total cross sections for *K*-shell to *K*-shell charge transfer for protons on argon are calculated in the Brinkman-Kramers and the Coulomb-projected Born approximations by using the Herman-Skillman potential for the active electron-target interaction in place of the usual Coulomb potential. This modification is found to lead to an improvement in the results. (12 refs.)

106569 $1s\rightarrow2s$ capture in proton-hydrogen charge transfer scattering. B.K.Rao, U.C.Satapathy, D.N.Tripathy (Inst. of Phys., Sachivalaya Marg, Orissa, India).
Indian J. Phys. Part B, vol.57B, no.2, p.195-201 (April 1983). [received: Sept. 1983]
The simple nonperturbative approach previously developed by the authors for the problem of charge transfer in proton-hydrogen collisions has been applied to calculate the cross section for the $1s\rightarrow2s$ capture process in that case. The results are close to the cross sections obtained in a recent experiment over a

wide range of energies. They are also comparable with the results from other theories. (11 refs.)

106570 Charge transfer in H^+-H^- collisions. M.Ghosh (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Calcutta, India).
Indian J. Phys. Part B, vol.57B, no.2, p.202-8 (April 1983). [received: Sept. 1983]
The Coulomb-Born approximation (CB) is applied to calculate the charge transfer cross section in H^+-H^- collisions in the intermediate and high energy region (50 to 1000 keV). The present computed values for the total cross sections are compared with the existing theoretical and observed values. The curve to the total cross section obtained in the CB shows a trend similar in nature with the other existing theoretical curves. (8 refs.)

106571 Electron transfer at crystallographically known long distances (25 Å) in [Zn^{II},Fe^{III}] hybrid hemoglobin. J.L.McGourty, N.V.Blough (Dept. of Chem., Northwestern Univ., Evanston, IL, USA), B.M.Hoffman.
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4470-2 (29 June 1983).
The authors describe the first example of long-range electron transfer between chromophores that are rigidly held at a fixed and crystallographically known distance and orientation. They employ mixed-metal, [M,Fe], hybrid hemoglobins that have both chains of one type, either α or β, substituted with a closed shell zinc(II) protoporphyrin (ZnP), whereas the two chains of the other type contain a ferriheme (Fe^{III}P): [Zn^{II},Fe^{III}]. (16 refs.)

106572 Relative electron affinities of substituted nitrobenezenes in the gas phase. E.K.Fukuda, R.T.McIver,Jr. (Dept. of Chem., Univ. of California, Irvine, CA, USA).
J. Phys. Chem. (USA), vol.87, no.16, p.2993-5 (4 Aug. 1983).
Using pulsed ion cyclotron resonance mass spectrometry, the authors have determined the relative electron affinities of 12 substituted nitrobenzenes in the gas phase by measuring equilibrium constants for electron transfer reactions of the the $C_6H_5NO_2^- + X\text{-}C_6H_4NO_2 = X\text{-}C_6H_4NO_2^- + C_6H_5NO_2$, where X is a substituent group. An excellent correlation is found between the relative electron affinities of the substituted nitrobenzenes and the relative gas-phase acidities of substituted anilines and phenols. (18 refs.)

106573 Single electron capture by Ar^{2+} and Ar^{3+} ions impacting helium. E.Y.Kamber (Dept. of Phys. & Astron., Univ. Coll., London, England), J.B.Hasted.
J. Phys. B (GB), vol.16, no.16, p.3025-35 (28 Aug. 1983).
Energy-loss spectra and different elastic and inelastic scattering functions for 540 eV single electron capture collisions of Ar^{2+} and 1250 eV Ar^{3+} ions with helium are reported and interpreted in terms of the avoided crossings of potential energy curves. Calculations are made of the proportions of long-lived excited states of these ions present in the beam, which is produced in an oscillating electron ion source. (9 refs.)

106574 Electron capture cross sections for TiH^{4+}. H.Sato, M.Kimura, A.E.Wetmore, R.E.Olson (Phys. Dept., Univ. of Missouri-Rolla, Rolla, MO, USA).
J. Phys. B (GB), vol.16, no.16, p.3037-44 (28 Aug. 1983).
Electron capture cross sections have been computed for $Ti^{4+} + H \rightarrow Ti^{3+} + H^+$ and $Ti^{3+} + H^+ \rightarrow Ti^{4+} + H$, where the reactants were in their ground states. The energy range investigated was 0.1 to 10 keV amu^{-1}. The impact parameter perturbed-stationary-state method incorporating electron translation factors were used to calculate the cross sections. The molecular wavefunctions were generated using the pseudo-potential method. At 1 keV amu^{-1} ($v_{rel} = 4.4 \times 10^7$ cm s^{-1}), representative electron capture cross sections for the $Ti^{4+} + H$ and $Ti^{3+} + H^+$ reactions are 2×10^{-15} cm^2 and 1×10^{-17} cm^2, respectively. An appreciable energy dependence was observed for both cross sections. (10 refs.)

106575 Comment on 'Radiative decay of lithium-like ions following exchange collisions of 3 keV amu^{-1} C^{4+} with H_2'. H.Winter (Inst. fur Allgemeine Phys., Tech. Univ. Wien, Wien, Austria).
J. Phys. B (GB), vol.16, no.17, p.L521-3 (14 Sept. 1983).
It is shown that *n,l*-state selective electron capture cross sections derived from observation of VUV emission lines for C^{4+}-H_2 collisions by Bliman et al. (1983) are incorrect because of inadequate evaluation of experimental results. The corrected data are compared with the author's own measurements and remaining discrepancies are explained. (10 refs.)

106576 Velocity dependence of Rydberg $n \rightarrow n'$ charge transfer cross sections. K.B.MacAdam, R.G.Rolfes (Dept. of Phys. & Astron., Univ. of Kentucky, Lexington, KY, USA).
J. Phys. B (GB), vol.16, no.17, p.3251-62 (14 Sept. 1983).
Measurements of the distribution of final n' states that are populated in charge transfer collisions of Ar^+ and Na^+ ions with Na in the 25s state are reported. Collision energies range from 580 to 2000 eV corresponding to projectile speeds v_1 from 0.572 to 1.400 times the RMS electronic orbital speed v_i in the initial state ($\tilde{v} = v_1/v_i$). The data are presented on a common relative scale of cross sections to indicate velocity or energy dependence. The cross section summed over all final states n' is of the form $\sigma^{1/2} = A\text{-}B$ in $\tilde{v}$ and agrees qualitatively with the velocity dependences of a Brinkman-Kramers (BK) calculation and of scaled experimental data for $p + H(1s) \rightarrow H$ (all states)$+p$. The data disagree with classical trajectory Monte-Carlo calculations for $\tilde{v} < 1$. Relative cross sections for $n \rightarrow n'$ are also presented for $n' = 20$ and 40. The peak positions and widths of the final-state distributions are compared with the predictions of the BK approximation. There is satisfactory agreement for low and intermediate final n', but the measured distributions show less than the predicted population of high final states. (51 refs.)

106577 Experimental study of the triatomic hydrogen molecule through the collisional sequence $H_3{}^+ \rightarrow H_3 \rightarrow H_3{}^+$ undergone by fast beams in argon. M.J.Gaillard, A.G.de Pinho, J.C.Poizat, J.Remillieux, R.Saoudi (Inst. Nat. de Phys. Nucleaire, Univ. Claude Bernard Lyon-1, Villeurbanne, France).
Phys. Rev. A (USA), vol.28, no.3, p.1267-75 (Sept. 1983).
The neutralizatioan-ionization method using two gas targets was employed to study the sequence $H_3{}^+ \rightarrow H_3 \rightarrow H_3{}^+$. The existence of long-lived states of the neutral molecule H_3 ($\tau \gtrsim 3 \times 10^{-7}$ s) is demonstrated, any ambiguity due to the presence of HD molecules being definitively removed. Dissociation cross sections of the molecular ion in argon have been measured and the dissociation cross section of the neutral molecule, the electron-capture, and the electron-loss cross sections have been estimated. The capture cross section for $H_3{}^+$ is extremely small (~1 b at 1 MeV) and decreases very rapidly with the velocity of the incident ion beam. It is suggested that these measured cross sections concern the formation of H_3 Rydberg states in a narrow band of *n* and *l* values. (24 refs.)

106578 Electron capture by slow Fe^{q+} ions from hydrogen atoms and molecules. R.A.Phaneuf (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1310-14 (Sept. 1983).
Total electron-capture cross sections have been measured for collisions for Fe^{q+} ions ($3 \leq q \leq 14$) with H and H_2 energies in the 10-95 eV/amu range. The cross sections increase approximately linearly with increasing ionic charge *q*, and for atomic hydrogen, can be represented by the empirical formula: $\sigma = q \times 10^{-15}$ cm^2 with an RMS deviation of ±26%. For Fe^{5+} and Fe^{6+}, for which higher-energy data exist, the cross sections are found to be essentially energy independent over the range $17 < E < 2000$ eV/amu. The cross sections for an atomic H target average 26% larger than for H_2. Agreement with generalized theoretical models is within a factor of 2 or better. (19 refs.)

106579 General classical scaling of electron-loss cross sections in collisions of atoms with highly charged ions. R.K.Janev (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1810-12 (Sept. 1983).
With the use of the classical concepts for electron capture and ionization, a general scaling relationship for the electron-loss section in collisions of atoms with highly charged ions is derived. The validity of the obtained formula is determined by the combined validity regions of the classical approximations for electron capture and ionization and covers a broad range of parameters in which most of present-day experiments are carried out. An analogous scaling formula for the $H^*(n) + H^+$ electron-loss collisions is also derived. (10 refs.)

106580 Orbiting charge-transfer cross section between He^+ ions and cesium atoms at near-thermal ion-atom energies. H.A.Schuessler, C.H.Holder,Jr., Chun-Sing O (Dept. of Phys., Texas A&M Univ., College Station, TX, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1817-20 (Sept. 1983).
The energy dependence of the total charge-transfer cross section for the collision of helium ions with cesium atoms at epithermal energies (0.1 to 1 eV) has been measured. It was observed that the cross section increases with $E^{-1/2}$. This can be attributed to orbiting collisions. The charge-transfer cross section is expressed as the product of the classical orbiting cross section and a quantum-mechanical charge-transfer probability which is shown to be energy independent. (15 refs.)

106581 Theory of low energy ion-ion charge exchange. A.Salin (Lab. d'Astrophys., Univ. de Bordeaux I, Talence, France).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.325-72
In the semi-classical theory one treats the motion of the nuclei classically whereas the motion of the electrons is treated by quantum mechanics. This does not mean necessarily that the classical motion of the nuclei can be considered as independent of that of the electrons. It is, on the contrary, quite clear that the potential experienced by the nuclei depends on the state of the electrons. Hence the trajectory described by the nuclei depends on the evolution of the electronic state while the evolution of the electronic state can be calculated once the trajectory of the nuclei is known. The author restricts himself to the simple situation where the trajectories of the nuclei can be obtained from a known potential $V_0(R)$ depending only on the relative distance between them. This potential, by definition, will be independent of the reaction channel, hence the name 'common trajectory' given to this approach (Gaussorgue et al., 1975). It is obvious that in ion-ion collisions at low energies the Coulomb repulsion between the two ions plays an important role so that its effect has to be included in V_0. The author shows the relation between the semiclassical theory and the quantum distorted wave theory. This relation has also the advantage to illustrate the basic ideas collision theory. (35 refs.)

106582 On the measurement of ion(atom)−ion (atom) charge exchange. F.Brouillard, W.Claeys (Inst. de Phys., Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.415-59
The authors derive some useful kinematic relations for the measurement of cross sections by means of intersecting beams. These include the formulation of center-of-mass energy of the collidants, laboratory-energies and angles of the products formed in elastic or inelastic processes. Kinematics provides a simple way to reach extremely low collision energies with energetic beams (merged beams) or reversely to convert tiny CM-inelastic losses or gains into observable laboratory effects. As a preliminary step, the concept of cross section is briefly reviewed. (23 refs.)

34.80 ELECTRON SCATTERING

106583 Energy relaxation of electrons in helium. B.Shizgal (Dept. of Chem., Univ. of British Columbia, Vancouver, British Columbia, Canada).
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.41-4 (26 Aug. 1983).
The energy relaxation of electrons in helium is examined with a discrete ordinate method of solution of the Lorentz-Fokker-Planck equation. A realistic theoretical e-He momentum-transfer cross section is employed. The time evolution of the energy is obtained in the form of a small number of exponential terms each characterized by an eigenvalue of the Lorentz-Fokker-Planck operator. (10 refs.)

106584 Electron detachment from negative ions in sulphur hexafluoride. D.Hansen, H.Jungblut, W.F.Schmidt (Hahn-Meitner-Inst. fur Kernforschung Berlin, Bereich Strahlenchemie, Berlin, Germany).
J. Phys. D (GB), vol.16, no.9, p.1623-34 (14 Sept. 1983).
A novel method for the investigation of electron detachment from negative ions has been developed. It allows the study of the influence of the age of the ions on the detachment process. Measurements were performed on sulphur hexafluoride at 73.3 and 110 mbar. The reduced detachment coefficient δ/n

was obtained for a narrow range of E/n values around 3.8×10^{-15} V cm^2. A significant influence of the age of the ions on δ/n was found, which is interpreted as being due to excited states of SF_6^-. (23 refs.)

106585 Bremsstrahlung of electrons in an atomic potential: the classical character of the spectrum; scaling laws. V.I.Kogan, A.B.Kukushkin (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
JETP Lett. (USA), vol.37, no.6, p.322-6 (20 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.6, p.272-5 (20 March 1983). [received: Sept. 1983]
A simple classical theory is developed for the bremsstrahlung of kilovolt electrons in a Thomas-Fermi potential, permitting the universalization of the voluminous body of numerical quantum results for this problem, which, in turn, have been confirmed by recent experiments. (8 refs.)

106586 Experimental studies of electron-ion recombination. J.B.A.Mitchell, J.W.McGowan (Dept. of Phys., Univ. of Western Ontario, London, Ontario, Canada).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.279-324
Electron-ion recombination is one of the most fundamental concepts in atomic and molecular physics and plays a major role in the chemistries of the upper atmosphere, interstellar space, combustion and thermonuclear fusion. Indeed, it has been from studies of these fields that much of the knowledge concerning the mechanisms of recombination has come. These studies have been backed up by a considerable theoretical and experimental effort in an attempt to gain a quantitative understanding of recombination as well as to elucidate the fine details underlying the electron capture and stabilization process for different ion species. In turn great advances have been made in these areas as a result of the improved understanding of the physics of recombination. (146 refs.)

Description of equipment for measuring differential cross sections in ion-neutral particle collisions at low energies ....See Entry 106633

34.80B Elastic scattering of electrons by atoms and molecules

106587 The structure of the scattering matrix. M.J.Seaton (Dept. of Phys. & Astron., Univ. Coll. London, London, England).
Comments At. & Mol. Phys. (GB), vol.13, no.4, p.171-8 (1983).
The scattering matrix has structures due to: (i) near-threshold effects; (ii) closed channels; (iii) use of wavefunction expansions which include both continuum functions and functions of bound-state type. In this comment the structure due to (iii) is derived without making use of the formalism of projection operators. (6 refs.)

106588 Determination of spin exchange scattering amplitude for 2*S*-2*S* transition. S.Sarkar, M.Chakrabarti (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Calcutta, India).
Indian J. Phys. Part B, vol.57B, no.2, p.149-53 (April 1983). [received: Sept. 1983]
Using the method of Corinaldesi and Trainor (1952) the authors perform the calculation for spin exchange scattering amplitude in the particular case of the 2*S*-2*S* transition in an electron atom collision. (3 refs.)

106589 Elastic scattering of electrons by hydrogen molecules. K.N.Joshipura (M.B. Patel Sci. Coll., Anand, India), H.S.Desai.
Indian J. Phys. Part B, vol.57B, no.2, p.161-5 (April 1983). [received: Sept. 1983]
Differential and total elastic cross-sections, total collisional cross-sections and momentum-transfer cross-sections, for elastic scattering of 100 eV-1000 eV electrons by hydrogen molecules are calculated, in the high energy higher order Born approximations of Yates (1979). The results are compared with theoretical and experimental data and sample results are shown. (14 refs.)

106590 Two-potential formulation in HHOB. C.N.Chandra Prabha, H.S.Desai (Dept. of Phys., Faculty of Sci., MS Univ. of Baroda, Baroda, India).
Indian J. Phys. Part B, vol.57B, no.2, p.190-4 (April 1983). [received: Sept. 1983]
The two-potential HHOB approximation is formulated parallel to the two-potential eikonal approximation. The theory developed for any target atom is applied to the special case of elastic $\bar{e}$-H atom scattering to calculate the differential scattering cross sections at the sample energy 200 eV. The results agree well with the recent measured and theoretical values. A significant imporvement over the basic HHOB approximation is obtained. (11 refs.)

106591 Angular distribution of electrons elastically scattered from O_2 at 40-500 eV: a two-potential coherent approach. A.Jain (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland).
Phys. Rev. A (USA), vol.28, no.3, p.1829-31 (Sept. 1983).
A coherent two-potential approach (in which multiple scattering is allowed) is used to calculate the integrated and momentum-transfer cross sections and differential cross sections for electron-O_2 elastic scattering in the energy range 40-500 eV. Above 100 eV, the present theory is in excellent agreement with experiment. However, below 100 eV, there are discrepancies at intermediate angles in the differential cross sections. (9 refs.)

106592 Calculation of elastic electron scattering cross sections for argon and krypton at low energies. H.P.Berg (Inst. fur Theoretische Phys., Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany).
Physica B & C (Netherlands), vol.122B+C, no.1, p.129-38 (Sept. 1983).
Theoretical results are presented of angular distributions for electrons over a range of 40°-110° elastically scattered from argon and krypton at energies between 10 eV and 50 eV, obtained by using the X_α-approximation including exchange terms in the scattering potential. The calculations give a rather reliable prediction in the whole energy range, in contrast to the calculations of McCarthy et al. (1977) and of Walker (1971) in particular at scattering energies below 25 eV. The theoretical data are in good agreement with the experiments, especially the measurements of Qing et al. (1967) and Meyr. (26 refs.)

106593 Scattering of electrons by atoms and photodetachment of negative ions in a homogeneous electric field. I.I.Fabrikant (Phys. Inst., Latvian Acad. of Sci., Latvian SSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.967-72 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1675-84 (Nov. 1982). [received: Sept. 1983]
Scattering of electrons by a force center in a homogeneous electric field is considered. The oscillatory energy dependence of the cross section, due to interference effects accompanying scattering, is investigated. The feasibility of experimental observation of the effects is analyzed. A multichannel theory of electron scattering by atoms and a multichannel theory of photodetachment of negative ions in an electric field are developed. It is shown that the phase shifts of electron scattering by atoms can be determined with high resolution by measuring the cross sections for the photodetachment of the corresponding negative ions in an electric field. (13 refs.)

34.80D Atomic excitation and ionization by electron impact

106594 The 1*s*-2*s* and 1*s*-2*p* excitation of helium ions by electron impact. M.Basu, P.S.Mazumder, A.S.Ghosh (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Calcutta, India).
Can. J. Phys. (Canada), vol.61, no.9, p.1297-300 (Sept. 1983).
The electron impact excitation of He^+ to the $n=2$ level is studied using two variants of the polarized orbital method, one due to Daskhan et al. (1981) and the other due to Temkin and Lamkin (1961). The present results for 1*s*-2*p* total excitation cross sections are in fair agreement with the measured values. For the 1*s*-2*s* excitation, our values fail to reproduce the more elaborate theoretical prediction by Morgan near the threshold energies. (22 refs.)

106595 Ionization of the hydrogen atom by electron impact with the use of the polarized-orbital method. P.S.Mazumder, M.Basu, A.S.Ghosh (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Calcutta, India).
Indian J. Phys. Part B, vol.57B, no.2, p.95-108 (April 1983). [received: Sept. 1983]
The triple differential cross section (TDCS) for the ionization of atomic hydrogen by electron impact has been calculated by employing the polarized orbital distorted wave method. The authors have also calculated the TDCS using the polarized plane-wave method including the effect of exchange, which has been approximately evaluated by Pathak and Srivastava (1980). The present results at 100 and 250 eV are in reasonable agreement with the measured values and existing theoretical predictions. (6 refs.)

106596 Electron impact double excitation in heliumlike ions 07. B.Padhy, R.Srivastava, D.K.Rai (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).
Indian J. Phys. Part B, vol.57B, no.2, p.109-18 (April 1983). [received: Sept. 1983]
Calculation of cross sections for the electron impact double excitation of heliumlike ions in the framework of Coulomb-Born-Oppenheimer approximation is presented. Closed form expression for both the differential and the total cross sections have been obtained without the use of partial wave analysis. The total cross section for excitation of Li^+ from the ground state to each of the excited states $2s^2\ {}^1Sg$, $2s2p1$, ${}^3p_u$, $2p^2\ {}^1Sg$, ${}^3Pg$ and ${}^1Dg$ is computed. (22 refs.)

106597 Fast evaluation of the relativistic ionisation form factor: momentum space representation. D.Trautmann, G.Baur, F.Rosel (Inst. fur Phys., Univ. Basel, Basel, Switzerland).
J. Phys. B (GB), vol.16, no.16, p.3005-13 (28 Aug. 1983).
The authors present a new and powerful method for the evaluation of the relativistic ionisation form factor in momentum space. Limiting cases and generalisations are discussed. (20 refs.)

106598 A measurement of the cross section for electron impact ionisation of Al^+. R.G.Montague, M.F.A.Harrison (Culham Lab., UKAEA, Abingdon, England).
J. Phys. B (GB), vol.16, no.16, p.3045-51 (28 Aug. 1983).
The crossed ion and electron beams technique has been used to make an absolute measurement of the cross section for the ionisation process $e+Al^+\rightarrow2e+Al^{2+}$ at electron energies ranging from below threshold up to 750 eV. The compounded random and systematic errors are estimated to be about ±5% at energies in excess of about 25 eV. The cross section for the ground-state ion is determined from the measured data using a small correction that allows for the presence of about 9% of metastable ions in the Al^+ beam. Comparison of the present data with the predictions of Lotz shows that the latter work appreciably overestimates the ground-state cross section at energies above 35 eV. The scaled Born prediction of McGuire is in closer agreement but it also exceeds the measured cross section above 35 eV. The shape of the Coulomb-Born-exchange cross section of Moores is in fair agreement but the magnitude is lower than the present data. (13 refs.)

106599 Electron excitation of Ca XVII. P.L.Dufton (Dept. of Pure & Appl. Phys., Queen's Univ. of Belfast, Belfast, N Ireland).
J. Phys. B (GB), vol.16, no.16, p.3053-63 (28 Aug. 1983).
Electron-excitation collision strengths have been calculated for transitions between the ten lowest levels of Ca XVII ($2s^2\ {}^1S_0$, $2s2p\ {}^3P_{0,1,2}$, $2s2p\ {}^1P_1$, $2p^2\ {}^3P_{0,1,2,}$ $2p^2\ {}^1D_2$, $2p^2\ {}^1S_0$). At high impact energies, where all the channels are open, the calculation was carried out in the *LS*-coupling approximation by means of the *R*-matrix method. Transitions between the fine structure levels were then determined by application of a unitary transformation to the *LS*-coupled *K*-matrices. At low impact energies, where some of the channels may be closed, an extension of the *R*-matrix method was employed to take account of relativistic effects directly in the scattering equations. In general, results are in good agreement with recent distorted-wave calculations. Electron-excitation rates are given for a range of electron temperatures. (25 refs.)

106600 Threshold behaviour for ionisation by electrons and positrons. S.Geltman (Max-Planck-Inst. for Quantenoptik, Garching, Germany).
J. Phys. B (GB), vol.16, no.17, p.L525-8 (14 Sept. 1983).
The threshold laws for atomic ionisation by electron and positron impact are derived in the Coulomb-projected Born approximation, and compared with other theories. There is a very large difference between the resulting threshold forms for electron and positron impact. (9 refs.)

106601 Electron impact excitation of the $n=2$ level in He^+ and H at low energies. N.R.Badnell (Dept. of Appl. Math. & Theoretical Phys., Cambridge Univ., Cambridge, England).
J. Phys. B (GB), vol.16, no.17, p.3263-78 (14 Sept. 1983).
Two Coulomb-exchange distorted-wave (CEDW) approximations are developed and applied to the electron impact excitation of the 1s→2s and 1s→2p transitions in He^+ and H at low energies. In the first approximation, CEDW1, partial waves are distorted by various direct multiple potentials. In the second approximation, CEDW2, particular partial waves are additionally distorted by an exchange monopole potential. Results for cross sections presented here are compared with those of the three-state close-coupling and Coulomb-Born-Oppenheimer approximations, and with experiment. Despite the unfavourable degeneracy of the 2s and 2p states in hydrogenic atoms, the CEDW2 approximation gives satisfactory agreement with the three-state close-coupling approximation for the 1s→2s transition and fairly good agreement for the 1s→2p transition together with a significant reduction in computing time. Thus the author's distorted-wave approach can be useful at low energies for singly-ionised and neutral atoms and is sufficiently promising to justify further development for application to more complex systems, where the authors no longer have the degeneracy of states that we do with hydrogenic atoms. (32 refs.)

106602 Electron transport parameters and excitation rates in argon. C.M.Ferreira, J.Loureiro (Centro de Electrodinamica, Univ. Technica de Lisboa, Lisboa, Portugal).
J. Phys. D (GB), vol.16, no.9, p.1611-21 (14 Sept. 1983).
A self-consistent set of electron impact cross-section and of excitation and ionisation rates was obtained for argon by making some adjustments in the experimental cross-section data available from the literature and requiring that calculated and measured electron transport quantities be in agreement. The calculations were made by numerically solving the Boltzmann transport equation. Values of the ratio of the electric field to the gas number density of interest in this work are in the range from 10 to 100 Td (Townsend). The resulting final set of cross-sections obtained here is not unique but represents one of the best possible combinations which can be sought for on the basis of presently available data. Therefore, the present results are relevant for the modelling of discharges in argon and in various visible and UV laser mixtures containing high concentrations of argon atoms. (54 refs.)

106603 Novel short-pulse photoionization electron source: Li $(1s2s2p)^4P^\circ$ deexcitation measurements in a plasma. J.C.Wang, R.G.Caro, S.E.Harris (Edward L. Ginzton Lab., Stanford Univ., Stanford, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.9, p.767-70 (29 Aug. 1983).
As a result of photoionization of rare-gas atoms by X-rays emitted from a laser-produced plasma, high densities ($>10^{16}$ cm^{-3}) of hot (~45-eV) electrons are produced in a pulse of ~600 ps duration. Following excitation by means of this electron source, the deexcitation rate constant from the Li $(1s2s2p)^4P^\circ$ level is measured to be 3×10^{-7} cm^3 s^{-1} at an electron density of ~10^{15} cm^{-3}. (8 refs.)

106604 Ionization: test of a continuum optical model for electron scattering. I.E.McCarthy, A.T.Stelbovics (Inst. for Atomic Studies, Flinders Univ. of South Australia, Bedford Park, Australia).
Phys. Rev. A (USA), vol.28, no.3, p.1322-8 (Sept. 1983).
An optical potential for taking account of the continuum in a coupled-channels calculation of electron scattering from atoms and ions must reproduce the total ionization cross section. This is tested here for a range of atoms and ions, using a momentum-space formulation based on the orthogonalized Born-Oppenheimer approximation to the ionization amplitude. The theory is quite acceptable as a fast calculation of total ionization cross sections, particularly at higher energies where distorted-wave methods are cumbersome. It compares quite satisfactorily with distorted-wave calculations for ions at lower energies near the maximum of the cross-section curve. (24 refs.)

106605 Double electron excitation in heliumlike ions. B.Padhy, R.Srivastava, D.K.Rai (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).
Phys. Rev. A (USA), vol.28, no.3, p.1825-8 (Sept. 1983).
A Coulomb-Born-Oppenheimer approach to the calculation of cross sections for electron-impact excitation of the doubly excited $2p^{2\,3}P$ state in heliumlike ions is presented. It is shown that closed-form expressions can be obtained for both differential and total cross sections. The analysis is applied to calculate the total cross section for the process $e^- + \mathrm{Li}^+(1s^{2\,1}S) \rightarrow \mathrm{e}^- + \mathrm{Li}^+(2p^{2\,3}\mathrm{P})$. (17 refs.)

106606 Theoretical triply differential cross section of electron-impact ionization of atoms. Keh-Ning Huang (Argonne Nat. Lab., Argonne, IL, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1869-72 (Sept. 1983).
The triply differential cross section of the electron-impact ionization of atoms is given in a parametrized form, suitable for theoretical computations or for semiempirical fittings. Application of the present formulation is demonstrated. Merits of coplanar measurements are discussed. It is also shown that the coplanar up-down asymmetry of the ejected electron is linear in the scattering angle, or the momentum transfer, of the incident electron for small momentum transfers. (5 refs.)

106607 Nucleus excitation due to annihilation of positron by bound atomic electrons. V.P.Aleshin.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1146-52 (Aug. 1983). In Russian.
Nucleus excitation is considered occurring due to energy released in annihilation of an incident positron and an electron from that in the nucleus atomic shell. Using the reciprocity theorem, the cross-section of the annihilation excitation is expressed through the coefficient of the monoenergetic pair conversion. The line shape is investigated and analytical expressions for the cross-section are given in some limiting cases. The comparison to the current theoretical approches is made and calculations of the cross-section for the annihilation excitation of ^{115,113}In, ^{111}Cd and ^{176}Lu are fulfilled. For these nuclei the calculated cross-section is approximately 10^{-2} of that found in the experiment except for ^{111}Cd where the theoretical value is only 5 times as low as the experimental one. (20 refs.)

106608 Theory of electron-atom collisions. Yong-Ki Kim (Argonne Nat. Lab., Argonne, IL, USA).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.101-65
The collision of electrons with atoms (including ions as special cases) is not only of interest to atomic physics itself but also has important applications in other fields such as astrophysics, plasma physics, and radiation physics. Although the main emphasis of this conference is on the interaction with ions, this paper covers interactions with both neutral atoms and ions. (76 refs.)

106609 Electron impact excitation of ions. D.H.Crandall (Phys. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.201-38
The author reviews electron-ion beams experiments primarily. The techniques, difficulties, and present trends in this area will be discussed. Measured cross sections are compared with theoretical results and the current level of agreement assessed. (76 refs.)

106610 Electron-impact ionization of ions. E.Salzborn (Inst. fur Kernphys., Justus-Liebig-Univ. Giessen, Giessen, Germany).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.239-77
Electron-impact ionization of atoms and ions is one of the fundamental collision processes in all types of plasmas—in astrophysical objects as well as in laboratory discharges. Many of the plasma properties, for example the radiation emitted, depend on the state of ionization of ions in these plasmas. In order to interpret spectroscopic observations and to find theoretical models for the formation and evolution of the plasma, cross sections for electron-impact processes are needed. The author gives a survey of the characteristic features of electron-ion ionisation processes with an emphasis on recent experimental progress. (110 refs.)

106611 The measurement of inelastic ion-ion and electron-ion collisions. K.T.Dolder (School of Phys., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.373-413
Dense gases or plasmas obey the laws of equilibrium thermodynamics and their properties can be discussed without recourse to atomic physics. Temperatures, for example, can be deduced from measurements of radiated energy simply by applying Stefan's law. But laboratory plasmas, stellar and planetary atmospheres are of greatest practical interest and they are rarely, if ever, in full thermodynamic equilibrium. Therefore details of all relevant atomic processes are required to construct theoretical models and deduce plasma properties from observations. (70 refs.)

34.80G Molecular excitation, ionization, and dissociation by electron impact

106612 Theoretical study of electron impact mass spectrometry. I. Ab initio MO study of the fragmentation of *n*-butane. T.Takeuchi, M.Yamamoto (Dept. of Chem., Nara Women's Univ., Nara, Japan), K.Nishimoto, H.Tanaka, K.Hirota.
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.139-48 (1 Sept. 1983).
The fragmentation mechanism of *n*-butane by low-energy electron bombardment has been studied by means of the ab initio MO method. Optimized geometries of possible *n*-butane cation conformers, reaction intermediates and fragments have been calculated using the energy gradient technique. The results suggest that the fragmentation to C_1+C_3 is more favorable than that to C_2+C_2, when the electron impact energy is at most only a few eV above the ionization threshold. The base peak at m/z 43 has been calculated to be due to the 2-propyl cation. In the course of fragmentation to C_1+C_3 proton tunneling is expected. (10 refs.)

106613 Electron scattering from alkali halide molecules. V.M.Chhaya (Dept. of Phys., MNV Sci. Coll., Rajkot, India), H.S.Desai.
Indian J. Phys. Part B, vol.57B, no.2, p.177-83 (April 1983). [received: Sept. 1983]
The low energy electron scattering from molecules belonging to alkali halide matrix is studied. The modified Born-Eikonal series method is employed to calculate rotational excitation cross sections. The curves are plotted for the incident electron energy versus total cross section for each column of alkali halide matrix. The conclusion is drawn regarding dependence of the total cross section with the electron-negativity difference of the molecules. (12 refs.)

106614 Electron energy-loss spectroscopy of carbon monoxide. II. The energy region 11 to 20 eV. B.Wallbank, S.Daviel, J.Comer, P.Hickes (Phys. Dept., Univ. of Manchester, Manchester, England).
J. Phys. B (GB), vol.16, no.16, p.3065-76 (28 Aug. 1983).
For pt.I see ibid., vol.15, no.12, p.1929-37 (1982). An electron impact spectrometer incorporating a position-sensitive multidetector has been used to study the excited electronic states carbon monoxide in the energy region 11 to 20 eV. A series of peaks previously assigned to one vibrational progression have been resolved into two progressions, one of which has been assigned to a transition to a previously unobserved state. At high impact energy and small scattering angle the spectra observed are in good agreement with previous photoabsorption data. At high scattering angle members of Rydberg series resulting from spin-forbidden transitions have been observed in the energy region below the first ionisation potential. At higher excitation energies several new spectral features have been observed, some of which have been assigned to Rydberg series. (23 refs.)

106615 Rotational excitation of CH_4 and H_2O by slow electron impact. A.Jain, D.G.Thompson (Dept. of Appl. Math., Queen's Univ. of Belfast, Belfast, N Ireland).
J. Phys. B (GB), vol.16, no.16, p.3077-98 (28 Aug. 1983).
Cross sections for rotationally elastic and inelastic scattering of slow electrons by spherical (CH_4) and asymmetric top (H_2O) molecules are calculated in the adiabatic-nuclei-rotation (ANR) approximation. The elastic scattering amplitude is derived in the molecule-fixed frame and the corresponding K matrix is obtained by solving a set of coupled differential equations; in which the total interaction potential includes an ab initio molecular core potential from the ground state near Hartree-Fock wavefunctions, an exchange term in the free-electron-gas-exchange (FEGE) model plus the orthogonalisation procedure and the distortion of the target through a recently proposed non-parametric polarisation potential of Jain and Thompson (1982). Symmetry properties and the selection rules for the asymmetric rotor in general are discussed. In order to avoid convergence problems for the molecule with a permanent dipole moment, an alternative two-stage hybrid S-matrix theory of Collins and Norcross (1978) along with the closure formula of Crawford and Dalgarno (1971) is adopted to obtain converged cross sections (in which proper use of the unitarised Born approximation is made). Results are compared with recent available measurement and calculations; there is a qualitative agreement for CH_4 with recent calculations performed in a different model. In the case of H_2O, some difficulties are discussed in comparing directly the authors' data with recent experimental cross sections. (51 refs.)

106616 Measurement of the branching ratio for the dissociative recombination of $H_2{}^+ + e$. J.B.A.Mitchell, J.L.Forand, C.T.Ng, D.P.Levac, R.Mitchell, P.M.Mul, W.Claeys, A.Sen, J.Wm.McGowan (Dept. of Phys., Univ. of Western Ontario, London, Ontario, Canada).
Phys. Rev. Lett. (USA), vol.51, no.10, p.885-8 (5 Sept. 1983).
The dissociative recombination of $H_3{}^+$ with electrons can have two exit channels, namely $e+H_3{}^+ \rightarrow H+H+H$ (channel I), and $e+H_3{}^+ \rightarrow H_2+H$ (channel II). A new technique has been developed which has been used to determine the relative contributions of channels I and II to the overall recombination process. Over the energy range from 0.01 to 0.05 eV it has been found that channel I dominates. (24 refs.)

106617 Nuclear dynamics in resonant electron-molecule scattering beyond the local approximation: the 2.3-eV shape resonance in N_2. M.Berman, H.Estrada, L.S.Cederbaum, W.Domcke (Inst. fur Phys. Chem., Univ. Heidelberg, Heidelberg, Germany).
Phys. Rev. A (USA), vol.28, no.3, p.1363-81 (Sept. 1983).
Resonant electron scattering from the N_2 molecule is treated within the framework of Feshbach's projection-operator formalism. The problem of

nuclear motion in the complex, nonlocal, and energy-dependent potential of the resonant state is solved with the use of basis-set expansion methods. The width function $\Gamma(E,R)$ of the 2.3-eV shape resonance is taken from previous ab initio calculations [A.U. Hazi, T.N. Rescigno, and M. Kurilla, Phys. Rev. A 23, 1089 (1981)]. The potential-energy curve $V_1(R)$ of the discrete electronic state giving rise to the resonance is adjusted to obtain quantitative agreement with experiment for the $\nu=0\rightarrow1$ vibrational excitation channel. Calculated cross sections are reported for many vibrational excitation channels including scattering from vibrationally excited target molecules and are compared with experiment. The results are in good agreement with experiment as far as experimental data are available. The information on the 2.3-eV shape resonance in N_2 obtained in this way (potential-energy curve, width function, complex pole of the S matrix, phase shift, etc.) is discussed and compared to the results of other ab initio and empirical calculations. Particular emphasis is laid on the assessment of the accuracy of the local complex potential approximation (boomerang model). It is shown that the local approximation is excellent for the 2.3-eV resonance in N_2 as far as the calculation of vibrationally inelastic cross sections is concerned. The local complex potential emerging from the present study differs significantly from the potential obtained empirically by Dube and Herzenberg [Phys. Rev. A 20, 194 (1979)], although the calculated cross sections are virtually identical for a large number of channels. The authors discuss the precision with which a local complex potential can be defined. (73 refs.)

106618 Dissociative recombination of an electron and a molecular ion. S.A.Akhmanov,Jr., K.S.Klopovskii, A.P.Osipov (Nuclear Phys. Res. Inst., Moscow State Univ., Moscow, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.936-42 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1623-33 (Nov. 1982). [received: Sept. 1983]
It is shown that the multichannel problem of the recombination of an electron and a molecular ion can be rigorously reduced to the determination of an optical potential for the elastic scattering of an electron by a molecular ion. A method, based on the formalism of many-particle theory, is proposed and makes it possible to construct the optical potential. As a result, formulas are derived for the resonance part of the dissociative-recombination cross section with allowance for strong channel coupling. These formulas are used to calculate the cross section for dissociative recombination of an electron and a molecular-oxygen ion in various vibrational states. All the quantities in the formula for the cross section are determined by the present method, and are not adjustable parameters. The results are in satisfactory agreement with the experimental data. (20 refs.)

106619 Study of electron attachment in air during prolonged interaction with an electron beam. Yu.P.Vagin, N.N.Morozov, B.M.Stepanov (All-Union Sci.-Res. Inst. of Optophys. Measurements, Moscow, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.254-5 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.406-8 (Feb. 1983). [received: Sept. 1983]
Intense sources of ionizing radiation such as high-current accelerators, pulsed reactors, etc., are widely used today in experimental physics. Intense irradiation can produce a variety of new effects in the exposed materials (e.g. air). These effects may be so large that they must be allowed for when experiments are conducted in the ionization region of intense sources. For radiation of low intensity (e.g., when an ionizing chamber is used to record exposure doses), it is usually assumed that the electrochemical properties of air are not changed by the radiation. This assumption is no longer valid when intense radiation fluxes are employed and the radiation doses are large (a few megarads). Under these conditions, various chemically active compounds (such as NO_2, NO, O_3, etc.) are produced in air which greatly alter the rates of various collisional processes; their influence is particularly great on one of the principal processes resulting in deionization of air, i.e. attachment of electrons to neutral molecules. The authors report experimental findings on the dependence of the lifetime of electrons in air on the radiation dose and on the factors determining the kinetics of attachment under their experimental conditions. (5 refs.)

106620 Potential energy curves for dissociative recombination. S.L.Guberman (Boston Coll., Newton, MA, USA).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.167-200
The direct dissociative recombination (DR) of a diatomic molecular ion, AB^+, with an electron is described by $AB^+ + e^- \rightarrow AB^* \rightarrow A+B$ where AB^* is a repulsive state of the neutral molecule which dissociates directly to A and B. The dissociation prevents the emission of an electron by AB^* and accounts for the high rate of electron recombination with molecular ions compared to atomic ions. The author presents a discussion of ab initio calculations of potential energy curves for the AB^* and AB^+ states. Results for recent large scale calculations for O_2 are presented along with additional results for H_2 and He_2. (84 refs.)

34.90 OTHER TOPICS IN ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS

106621 Atomic and molecular physics near ionization thresholds in high fields. J.P.Connerade (Blackett Lab., Imperial Coll., London, England), J.C.Gay, S.Liberman.
Comments At. & Mol. Phys. (GB), vol.13, no.4, p.189-203 (1983).
The study of atoms (and potential molecules) in high fields has become an area of renewed interest among atomic physicists since the discovery of quasi-Landau resonances in 1969. The problem is not merely one of refining one's understanding of atomic interactions to more elaborate and varied external perturbations, rather, it is of fundamental nature and requires a novel approach. A colloquium on the theme Atomic and Molecular Physics near Ionization Thresholds in High Fields (CNRS International Colloquia No.334) was held at Aussois (France) in June 1982 and attracted 80 participants from Laboratories in Europe and the USA. This comment is a brief survey of selected themes, obviously influenced by the activities of the authors. A full record of the colloquium appears in the Proceedings. (14 refs.)

106622 Merged electron-ion beam experiments. V. Dissociative recombination of OH^+, H_2O^+, H_3O^+ and D_3O^+. P.M.Mul, J.W.McGowan, P.Defrance, J.B.A.Mitchell (Dept. of Phys., Univ. of Western Ontario, London, Ontario, Canada).
J. Phys. B (GB), vol.16, no.16, p.3099-107 (28 Aug. 1983).
For pt.IV see ibid., vol.14, no.8, p.1353-671 (1981). Absolute cross sections for dissociative recombination of OH^+, H_2O^+, H_3O^+ and D_3O^+ have been measured using a merged electron-ion beam apparatus through an energy interval from 0.01 to 1 eV. The recombination cross section for the diatomic OH^+ is small, one of the smallest measured by the authors for a diatomic ion. The cross sections for the polyatomics H_2O^+, H_3O^+ and D_3O^+ are large and nearly identical. Like most other polyatomic ions they exhibit nearly an $E_{cm}{}^{-1}$ energy dependence below approximately 0.1 eV. At higher energies the slope of the cross section versus electron energy is much steeper with an energy dependence near $E_{cm}{}^{-2}$. Cross sections for D_3O^+ are less than those for H_3O^+ indicating the presence of a small isotope effect. (32 refs.)

106623 Recoil-induced excitation of atoms by neutron scattering. T.W.Ruijgrok, B.R.A.Nijboer (Inst. for Theoretical Phys., Univ. of Utrecht, Utrecht, Netherlands), M.R.Hoare.
Physica A (Netherlands), vol.120A, no.1-2, p.537-44 (1983).
When a medium energy neutron hits a free atom there is a finite probability that as a consequence of the recoil the atom becomes excited or ionised. For the simple case of a hydrogen atom exact calculations are reported of the transition probabilities for various initial and finite states as a function of the momentum transfer. (3 refs.)

106624 Ultrahigh-resolution study of autodetachment in $C_2{}^-$. U.Hefter, R.D.Mead, P.A.Schulz, W.C.Lineberger (Dept. of Chem., Univ. of Colorado, Boulder, CO, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1531-8 (Sept. 1983).
The authors describe a new coaxial laser-ion-beam photodetachment spectrometer designed to measure high-resolution photodetachment spectra of negative ions, and the measurement of $C_2{}^-$ autodetachment rates with it. The apparatus resolution of 10 MHz is sufficient to resolve linewidth and line shape of autodetaching resonances in $C_2{}^-$. Autodetachment rates of the $B^2\Sigma_u{}^+$ state have been measured for a variety of rotational levels with $\nu'=6$, 7, 8, and 9. The observed rates vary between 10^7 and 10^{10} s^{-1}, depending on vibrational and rotational state. Autodetachment of high vibrational levels ($\nu'=19$) of the $A^2\Pi_u$ state has been seen to be slower than 10^8 s^{-1}. The physical processes giving rise to these results are discussed in some detail. (33 refs.)

106626 The mean static dipole polarisability of scandium. R.Glass, G.S.Chandler (Dept. of Phys. & Inorganic Chem., Univ. of Western Australia, Nedlands, Australia).
J. Phys. B (GB), vol.16, no.16, p.2931-6 (28 Aug. 1983).
The mean static dipole polarisability of scandium is calculated. Perturbation theory was used so that the polarisability is expressed in terms of the second-order energy correction. The ground-state and necessary first-order correction to the wavefunction were determined variationally as a superposition of configurations. The importance of the various polarising orbitals and the length of the configuration expansion are examined. (11 refs.)

106628 Structure and bonding of the first η^2-coordinated P_4 ligand: molecular structure of trans-$[Rh(P_4)(PPh_3)_2Cl].2CH_2Cl_2$ at 185K. W.E.Lindsell, K.J.McCullough (Dept. of Chem., Heriot-Watt Univ., Edinburgh, Scotland), A.J.Welch.

J. Am. Chem. Soc. (USA), vol.105, no.13, p.4487-9 (29 June 1983).

Although the complex $Rh(P_4)(PPh_3)_2Cl$ (**1**) and related derivatives of Rh and Ir were synthesized several years ago, the precise nature of the novel M-P_4 interaction was not established. In the more recently characterized complexes $M[N-(CH_2CH_2PPh_2)_3]P_4$ (**2**, M=Ni; **3**, M=Pd) the P_4 tetrahedron is η^1-coordinated to the metal. For complex **1**, however, the alternative η^2-or η^3-coordination modes are also feasible. Indeed, a very recent NMR study of **1** suggested η^2-coordination for the P_4 unit. It was clearly of considerable importance to characterize **1** by X-ray diffraction, to corroborate the conclusions of the NMR experiment and also to furnish accurate structural parameters for the coordinated P_4 moiety (errors in P-P lengths in the structural study of **2** being rather large). Recrystallization from dichloromethane at 195K has afforded suitable crystals as a solvate ($Rh:CH_2Cl_2=$**1**:2), which on rapid transference to a diffractometer equipped with a low-temperature attachment enabled an accurate structural study to be undertaken. 35.20M Electric and magnetic moments (and derivatives), polarizability, and magnetic susceptibility

106629 Static dipole moment of two coupled systems (molecules). J.M.Vigoureux (Lab. de Phys. Moleculaire, Univ. de Besancon La Bouloie, Besancon, France).
J. Chem. Phys. (USA), vol.79, no.5, p.2363-8 (1 Sept. 1983).
The author presents the expression for the dipole moment of a pair of nonidentical systems in terms of the frequency dependent polarizabilities and hyperpolarizabilities. The author's calculations are quite general and include the two particular cases of the near-zone (London) and of the far-zone (Casimir) limits. The author first considers the case of two dissimilar centrosymmetric systems and then, the more particular one of two spherical ones. (11 refs.)

106630 Excited state dipole moments of some monosubstituted benzenes from solvent effect on electronic absorption spectra. L.S.Prabhumirashi, D.K.Narayanan Kutty, A.S.Bhide (Chem. Dept., Poona Univ., Pune, India).
Spectrochim. Acta Part A (GB), vol.39A, no.8, p.663-8 (1983).
The excited state dipole moments of a number of monosubstituted benzenes in their ^1L_a and ^1L_b states are estimated from solvent induced shifts in the corresponding electronic absorption bands by following a recently indicated modified procedure. Some regular trends, apparent from the results, are discussed. The present results are in good agreement with those available in literature which are based on other experimental methods such as optical Stark effect, microwave Stark effect, etc. The proposed method is however found to be suitable for a wider variety of molecules and their electronic transitions accessible in the near u.v.-vis. region. 35.20P Rotation, vibration, and vibration-rotation constants

106631 Improved constants, Franck-Condon factors and r-centroids including vibration-rotation interaction for the B-X transition of ScO. C.B.Suarez (Dept. of Phys., Univ. of La Plata and Consejo Nacional de Investigaciones Cientificas y Tecnicas, La Plata, Argentina).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.295-8 (1983).
The authors report Franck-Condon factors, *r*-centroids and a new set of constants for the B-X transition of ScO (blue system) that correlate with observed band intensities and band origins. The vibration-rotation effect turns out to be of importance for some bands. A numerical calculation of centrifugal distortion constants agrees with experimental data. (14 refs.)

106632 Vibrational spectra and conformational analysis of substituted three membered ring compounds. C.J.Wurrey (Dept. of Chem., Univ. of Missouri, Kansas City, MO, USA), J.E.DeWitt, V.F.Kalasinsky.
In book: *Vibrational spectra and structure. A series of advances. Vol.12*, J.R.Durig [Ed.], p.205-322. Amsterdam, Netherlands: Elsevier (1983), xvi+497 pp. [0 444 42197 1]
Since all physical and chemical properties of a substance ultimately are derived from its molecular structure, the determination of the structural features of molecules has intrigued scientists for many years. One specific aspect of molecular structure involves the orientation about a particular bond (or about several bonds) of one portion of the molecule with respect to the rest of the molecule—in other words, the molecular conformation about that bond (or those bonds). The authors study the vibrational spectra and conformation of substituted three membered ring compounds. (158 refs.)

35.80 ATOMIC AND MOLECULAR MEASUREMENTS AND TECHNIQUES

106633 Description of equipment for measuring differential cross sections in ion-neutral particle collisions at low energies. G.Zarate Mejia, D.Galvis Sanchez (Dept. de Fisica, Univ. Nacional de Colombia, Bogota, Colombia), V.Herman.
Rev. Colomb. Fis. (Colombia), vol.15, no.1, p.95-106 (1981). In Spanish. [received: Aug. 1983]
Following a short mention of the usefulness of measuring differential cross-sections in scattering experiments is a description of an equipment built with that purpose at the Physics Department of Universidad Nacional de Colombia in Bogota. A sample of results obtained is shown and some possible steps for its improvement are proposed. (19 refs.)

106634 Direct kinetic study of CH($A^2\Delta$). C.Nokes, G.Gilbert, R.J.Donovan (Dept. of Chem., Univ. of Edinburgh, Edinburgh, Scotland).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.491-3 (19 Aug. 1983).
Time-resolved kinetic studies of CH($A^2\Delta$), following formation by ultraviolet multiphoton excitation of $(CH_3)_2CO$ and CH_2I_2, are reported. Absolute rate constants (300K) for removal of CH($A^2\Delta$) by H_2, O_2 and CH_4 are determined at $(8.5\pm0.4)\times10^{-12}$, $(1.10\pm0.04)\times10^{-11}$ and $(2.0\pm0.1)\times10^{-11}$ cm^3 molecule^{-1} s^{-1}, respectively. In each case the rate constant for removal of CH($A^2\Delta$) is less than that for the ground electronic state, CH(X ^{2}II). (10 refs.)

106635 NonMaxwellian velocity distributions in the transition region of supersonic expansions of the noble gases He, Ne and Ar. H.C.W.Beijerinck, G.H.Kaashoek, J.P.M.Beijers, M.J.Verheijen (Phys. Dept., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
Physica B & C (Netherlands), vol.121B+C, no.3, p.425-36 (Aug. 1983).
Small deviations of a Maxwell-Boltzmann velocity distribution are conveniently described by a function $B(\nu)[1+\Sigma_{n1}{}^{N}=3\gamma_n H_n(\nu)]$, with $B(\nu)$ the undisturbed distribution function and $H_n(\nu)$ the Hermite polynomials. The upper limit N is determined by the accuracy required. A selection of e.g. only odd or even terms is determined by the symmetry of the problem. Measurements for He and Ne of the velocity distribution perpendicular to the streamlines of the expansion, as described by a virtual source, result in a kurtosis parameter $\gamma_{\perp,4}=1.15\times10^{-2}$ of the central virtual source, independent of the source conditions. This value is in fair agreement with an a priori estimate $\gamma_{\perp,4}=0.7\times10^{-2}$ from a simple transition region model and full calculations by Klots (1982) within the framework of the thermal conduction model. The radii R_1 and R_2 and the relative populations c_1 and c_2 of the narrow and the wide virtual source, respectively, are in good agreement with the results obtained with undisturbed free jets in a cryo-expansion chamber. This indicates that free jets of the gases He and Ne (with their small Van der Waals constants) are hardly influenced by the finite pumping speed of 1000 1/s in the expansion chamber. For Ar the authors obtain 33% larger values for R_1, showing the influence of scattering by residual gas. (19 refs.)

Diode-laser spectroscopy of supersonic free jets .... See Entry 106399

High vibrational overtones in $SiHCl_3$ and SiH_2Cl_2 .... See Entry 106436

36.00 STUDIES OF SPECIAL ATOMS AND MOLECULES

36.10 EXOTIC ATOMS AND MOLECULES (CONTAINING MESONS, MUONS, AND OTHER ABNORMAL PARTICLES)

106636 Coulomb-nuclear interference in hadronic atoms. J.Thaler (Inst. fur Theoretische Phys., Univ. Graz, Graz, Austria).
J. Phys. G (GB), vol.9, no.9, p.1009-24 (Sept. 1983).
A rapidly converging expansion method for the Coulomb T operator is applied to relate S-wave strong interaction shifts and widths in the ground state of mesic atoms to the pure hadronic scattering length in the corresponding scattering system. The result improves the accuracy of the Deser formula and, in combination with other methods, allows a determination of Coulomb corrections to S-wave scattering lengths in a model-independent way. In detail, the author discusses various corrections in the ground state of kaonic hydrogen, where a discrepancy between bound-state and scattering data exists which is not yet understood. Further applications are given for heavier pionic atoms and atomic protonium. (31 refs.)

106637 Pionic 3d→2p X-ray measurements in ^{50,52,54}Cr, ^{45}Sc, ^{51}V, ^{55}Mn and Fe. R.Kunselman (Phys. Dept., Univ. of Wyoming, Laramie, WY, USA), R.J.Powers, M.V.Hoehn, E.B.Shera.
Nucl. Phys. A (Netherlands), vol.A405, no.3, p.627-47 (5 Sept. 1983).
Reports the measurement of the strong interaction shifts and widths of the pionic 3d→2p transitions in separated isotopes of ^{50,52,54}Cr and natural Sc, V, Mn, and Fe. Using these new data in combination with earlier low-Z pionic data ($6\leq Z\leq20$) the authors have studied the phenomenological pion-nuclear potential. Employing nuclear structure information from measured charge densities and Hartree-Fock calculations, they have fitted the pion-nuclear potential parameters to the pionic-atom data. They have explored the sensitivity of these data to the value of the Lorentz-Lorenz parameter ξ. The addition of an isovector dependence to the s- and p-wave two-nucleon terms is shown to be unnecessary at the present level of experimental accuracy. They have used the deduced optical potentials to determine the neutron radii of the nuclei $20\leq Z\leq26$ and find reasonable agreement with Hartree-Fock predictions and with the results of the hadronic probes for $20\leq Z\leq23$ but poor agreement for $24\leq Z\leq26$. (68 refs.)

106638 Additional radiative-recoil corrections to muonium and positronium hyperfine splitting. J.R.Sapirstein, E.A.Terray, D.R.Yennie (Newman Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.11, p.982-4 (12 Sept. 1983).
A compact expression for one-loop radiative corrections to lepton lines in positronium and muonium hyperfine splitting is presented. It is valid for hyperfine-splitting contributions of order $\alpha^2 E_F$, including the effects of recoil to all orders. For muonium, known nonrecoil parts of this contribution are easily evaluated analytically, as is a previously calculated radiative-recoil contribution of order $\alpha^2 E_F(m_e/m_\mu)\ln(m_\mu/m_e)$. Nonlogarithmic radiative-recoil corrections obtained by numerical evaluation of this expression yield new contributions of 2.64 ± 0.07 kHz for muonium and -11.12 ± 0.02 MHz positronium. (8 refs.)

106639 Some aspects of muonium atom chemistry. A.Cecal, C.Hatnean (Inst. Politehnic, Iasi, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.35, no.6, p.567-76 (1983). In Rumanian.
Consists of a theoretical study on the formation and deceleration of penetrons, penetron strains and penetron atoms, followed by several examples of chemical transformations induced by these unstable atoms when interacting with atoms and molecules of substances in different states of aggregation. (23 refs.)

106640 Lifetime of the mesic molecule $dt\mu$. L.N.Bogdanova, V.E.Markushin, V.S.Melezhik, L.I.Ponomarev (JINR, Dubna, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.931-5 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1615-22 (Nov. 1982). [received: Sept. 1983]
A lifetime of $\tau\approx10^{-11}$ sec is calculated for the mesic molecule $dt\mu$ produced resonantly in the excited rotational-vibrational state $J=\nu=1$. (22 refs.)

36.20 MACROMOLECULES AND POLYMER MOLECULES

(for biological macromolecules, see also 87.15; for polymer reactions and polymerization, see 82.35)

106641 The freely jointed chain in expanded form. A.J.Galli, W.H.Brumage (Dept. of Phys., Louisiana Tech. Univ., Ruston, LA, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2411-18 (1 Sept. 1983).
The distribution function for an exact treatment of an n-link freely jointed chain is obtained in expanded form to order $1/n^3$. Comparisons are made with modified Gaussian distribution functions of the same order. (6 refs.)

106642 A Monte Carlo off-lattice method: the slithering snake in a continuum. C.Brender, M.Lax (Dept. of Chem., Bar Ilan Univ., Ramat-Gan, Israel).
J. Chem. Phys. (USA), vol.79, no.5, p.2423-5 (1 Sept. 1983).
An off-lattice Monte Carlo simulation of a polymer chain using the slithering snake method is introduced. The mean square end-to-end distance is calculated and compared with previous studies. Results indicate that small angular deviations from the tetrahedral lattice models produce large conformational change in the polymer chain. (10 refs.)

106643 Effects from bead size and hydrodynamic interactions on the translational and rotational coefficients of macromolecular bead models. J.Garcia de la Torre, V.Rodes (Dept. de Quimica Fisica, Univ. de Murcia, Murcia, Spain).
J. Chem. Phys. (USA), vol.79, no.5, p.2454-60 (1 Sept. 1983).
In the work, the authors analyze a deficiency of the currently used form of the Kirkwood-Riseman (KR) theory for macromolecular bead models in regard to the finite size of the beads and illustrate the importance of a more complete description of hydrodynamic interactions. They consider several exact or very accurate theories for two-bead models and compare their results with different KR-based methods. One of them is the substitution technique in which the beads are substituted by a cubic array of smaller spheres. Its disadvantage is an increase in computer requirements. A novel result of their work is very simple correction for the KR rotational coefficients intended to correct, in part, the failure originated by size effects. The comparison of the various approaches has been made for two specific cases, the rigid dumbbell and prolate ellipsoids, for which rigorous results are available. The authors show that the performance of the substitution technique is excellent, and that their correction improves in many cases the KR results for rotation. (21 refs.)

106644 Renormalization group theory of transport properties of polymer solutions. II. Rotatory friction coefficient vs. intrinsic viscosity. Y.Oono, M.Kohmoto (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2478-81 (1 Sept. 1983).
For pt.I see ibid., vol.78, no.1, p.520 (1983). The rotatory friction coefficient f_r is calculated with the aid of the renormalization group theory. The present calculation shows that the ratio of f_r to the intrinsic viscosity $[\eta]$ depends on the excluded volume and the draining effects. The calculated ratio $f_r/[\eta]$ is about ~5%-7% less than the conventional value which is obtained by using the preaveraging approximation of the Oseen tensor. The conventional value is independent of the excluded volume and draining effects. (9 refs.)

106645 Application of two-dimensional relayed coherence transfer experiments to ^{1}H NMR studies of macromolecules. G.King, P.E.Wright (Dept. of Inorganic Chem., Univ. of Sydney, Sydney, NSW, Australia).
J. Magn. Resonance (USA), vol.54, no.2, p.328-32 (Sept. 1983).
Relayed coherence transfer (RCT) spectroscopy has recently been proposed as a method for establishing connectivity between two remote nuclei within a given spin system (Aue et al., 1976). In its simplest 2D variant, the mixing pulse of the COSY pulse sequence is replaced by a $90°-\tau-180°-\tau-90°$ pulse train. This can induce two consecutive coherence transfer processes, resulting in magnetization transfer between nuclei A and X of an AMX spin system, for example. RCT experiments were performed with full quadrature detection using N-type peak selection. The value of τ was set in the range 30 to 40 msec to optimize relayed magnetization transfer involving coupling constants of 6-8 Hz. (16 refs.)

106646 The behaviour of polyelectrolyte solutions in elongational flow; the determination of conformational relaxation times (with an appendix of an anomalous adsorption effect). M.J.Miles, K.Tanaka, A.Keller (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).
Polymer (GB), vol.24, no.9, p.1081-8 (Sept. 1983).
The elongational flow method for determining conformational relaxation times of macromolecules (τ) in solution, based on the determination of the critical strain rate to induce the coil→stretch transition has been described previously for neutral polystyrene (PS) solution. It is applied to a polyelectrolyte, the Na^+ salt of polystyrene sulphonate (NaPSS), which is available in monodisperse form in several molecular weights. In highly dilute solutions in the absence of added salt, τ is up to three orders of magnitude larger than for neutral PS indicating a more expanded and/or more permeable chain conformation. The existence of a critical strain rate plus the observed quadratic molecular-weight (M) dependence suggest a free-draining coil at these low salt concentrations. On adding salt, a drastic and sharp decrease in τ, followed by a more gentle decrease on addition of further salt, is interpreted as

a transition to a more collapsed non-free-draining coil behaviour, which is then retained. On raising and subsequently lowering of pH, τ increases and decreases in a reversible manner with a small hysteresis corresponding to the overall increase in salt concentration. Exchanging Na^+ or Ca^{++} decreases τ drastically, from which a stiffer and more compact molecular conformation, assigned to intramolecular ionic bridging, is inferred. However, the same dependence on ionic strength of added salt is otherwise observed. For divalent salt forms, τ increases with polymer concentration until gelation occurs, indicating intermolecular ionic bridging. (20 refs.)

36.40 ATOMIC AND MOLECULAR CLUSTERS

106647 Two-photon-ionization mass spectroscopy of ammonia clusters in a pulsed supersonic nozzle beam. H.Shinohara (Inst. for Molecular Sci., Okazaki, Japan).
J. Chem. Phys. (USA), vol.79, no.4, p.1732-40 (15 Aug. 1983).
Two-photon-ionization (TPI) with an ArF excimer laser at 193 nm, when combined with a mass spectrometer, is found to be a very sensitive method for the detection of ammonia clusters. Ammonia cluster distributions in the pulsed beam expansion have been measured via TPI by varying the delay time between the pulsed beam and the laser firing. The relative intensity of the clusters as observed by the TPI is a sensitive function of the delay time. Furthermore, seeding effects on the ammonia cluster distribution with He, Ne, Ar, and Kr carrier gases are examined. The distribution shifts toward high mass region with increasing mass of the seeding gases. Finally, an effective competition between the one-photon predissociation and two-photon ionization at the $\tilde{A}^1A''_2$ state of the ammonia monomer (which is insignificant in the clusters) is found and discussed in terms of a simple rate-equation treatment valid in this system. (35 refs.)

106648 On the optimum direction of magnetic force in magnetic separation experiments. D.Zoler, A.Segal, G.Calugaru (Dept. of Phys., Polytech. Inst. of Jassy, Jassy, Rumania).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.5, p.591-4 (1983).
At present there is great interest in improving the magnetic separation methods, so as to fractionate nonferrous materials from the residue of incinerated urban refuse. Important progress has been made along this line by making use of the levitation property of magnetic fluids. The authors discuss a new separation procedure in which the magnetic force is at an oblique angle γ from the horizontal. The resultant vector summation of this force and the gravitational force forms an angle σ with the horizontal. This angle depends on particle density as well as on the density of the magnetic fluid. They obtain the expression for the angle σ and also the relation for the magnetic force. They estimated the optimum numerical values of γ for eleven nonferrous elements: Mg, Be, Al, Zn, Cu, Co, Mo, Ag, Pb, Hg, W, and for the following values of the parameter a: $(4,5,6,7,8)\times10^{-4}m^3/kg$. (6 refs.)

41.10D Electrostatics, magnetostatics

106649 Analysis of stationary electrical fields generated by sets of thin conductive electrodes in non-homogeneous environment. K.Adamiak.
Arch. Elektrotech. (Germany), vol.66, no.4, p.217-23 (1983).
Equations are formulated to allow analysis of stationary electrical fields generated by thin electrodes which do not form a closed surface. It is assumed that bodies with different electrical properties (dielectrics or conductors) can be found in the space around the electrodes. The problem is reduced, in general case, to a system of integral equations, of which at least some are Fredholm integral equations of the first kind with singular kernels. Numerical calculations of some selected problems are made by using the finite difference method. (22 refs.)

106650 The capacitances of two arbitrary conductors. Y.L.Chow, M.M.Yovanovich (Dept. of Electrical Engng., Univ. of Waterloo, Waterloo, Ontario, Canada).
J. Electrostat. (Netherlands), vol.14, no.2, p.225-34 (Aug. 1983).
The capacitance or charges of two arbitrary conductors are normally computed by numerical methods. All these numerical methods frequently require substantial computer time and programming effort. It would be desirable to have some simple method in place of these numerical methods and still give acceptable errors of say less than 5 or 10%. There is, in principle, a simple method to calculate the charges and capacitance of a two conductor system. The method is based on the elastance matrix by Smythe (1968), with elastance defined as the reciprocal of capacitance. Through the inversion of a 2×2 elastance matrix, one obtains the capacitance matrix and, subsequently, simple formulas for the charge and capacitance calculations of the two conductors. (9 refs.)

106651 Shape and stability of electrostatically levitated drops. P.M.Adornato, R.A.Brown (Dept. of Chem. Engng., MIT, Cambridge, MA, USA).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1796, p.101-17 (8 Sept. 1983).
An electrically conducting drop held together by surface tension is statistically levitated in an insulating medium by accumulating a net charge on its surface and applying an DC field in the direction of gravity. Asymptotic analysis for small electric fields shows the coupling at $O(E_0^3)$ between the second and third Legendre functions that describe the characteristic three-lobed drop shapes. Drops with large deformations are calculated by a Galerkin finite element scheme that leads to simultaneous determination of shape stability. The locus of $\bar{Q}$ and $\bar{E}_0$ marking the loss of existence of static drops is determined; end points corresponding to no field ($\bar{E}_0=0$) and no charge ($\bar{Q}=0$) agree well with calculations of Rayleigh and Taylor, respectively. Shapes predicted by the perturbation analysis are within two percent of the finite element calculations for almost the entire accessible ranges of $\bar{Q}$ and $\bar{E}_0$. (24 refs.)

106652 Electrical field in cylindrical symmetrical layouts by variational calculus. A.Ivanyi (Dept. of Theoretical Electricity, Tech. Univ., Budapest, Hungary).
Period. Polytech. Electr. Eng. (Hungary), vol.26, no.3-4, p.221-30 (1982). In English.
Deals with the variational solution of static and stationary fields in cylindrical symmetrical layouts of a homogeneous medium. An approximate solution of the two-dimensional Laplace equation exactly satisfying the prescribed Dirichlet-type boundary conditions is constructed in analytical form. The functions needed for satisfying the boundary conditions on curves described at least piecewise analytically are constructed with the aid of R-functions. The application of the method is illustrated in an example. (8 refs.)

106653 Some electrical problems for a torus. V.Belevitch, J.Boersma (Philips Res. Lab., Brussels, Belgium).
Philips J. Res. (Netherlands), vol.38, no.3, p.79-137 (1983).
The classical treatment of the Laplace equation by separation of variables in toroidal coordinates is used to obtain analytical expressions and numerical results for the solution of various electrostatic problems pertaining to a perfectly conducting torus; charged torus in free space, torus in a uniform axial or transverse electric field. Two quasi-stationary electromagnetic problems for a perfectly conducting torus are also solved: (i) current resulting from a uniform alternating potential difference applied over a cut at a meridian cross-section, (ii) current induced by a uniform axial alternating magnetic field; in both cases, the torus inductance is computed and the high-frequency resistance of an imperfectly conducting torus is deduced. For a tight torus, that is, a torus without central hole, a suitable rescaling reduces the conformal representation defining the toroidal coordinates to Kelvin's inversion. Solutions of the mentioned problems for the tight torus are obtained directly by inversion and also as limits of the solutions for the general torus; approximations to the solutions for the case of an almost tight torus are discussed as well. (53 refs.)

41.10F Steady-state electromagnetic fields; electromagnetic induction

106654 On eddy currents in thin plates. J.Poltz.
Arch. Elektrotech. (Germany), vol.66, no.4, p.225-9 (1983).
See also ibid., vol.64, p.307-11 (1982). A method of calculation of eddy currents in thin plates is presented. The stationary eddy-current problem is solved by using a scalar potential. The reaction of the eddy currents on the magnetic field is taken into account by application of an integral equation. Further, a combination of finite elements with the integral equation is presented to calculate an approximated solution for optional configuration of the plate. (6 refs.)

106655 'Eddy-current losses in thin circular and rectangular plates'. A.Prechtl, H.Haas (Tech. Univ. Wien, Wien, Austria).
Arch. Elektrotech. (Germany), vol.66, no.4, p.231-2 (1983).
Points out where Krakowski's analysis fails and presents a modified governing equation relying on the same assumptions. (1 ref.)

106656 Compatibility of Maxwell's field-equations in time and frequency domain. V.A.Vlcek (Tech. Hochschule Darmstadt, Darmstadt, Germany).
Frequenz (Germany), vol.37, no.2, p.26-31 (Feb. 1983). In German. [received: Aug. 1983]
A consequence of the natural frequency dependence of permittivity and permeability is a temporally nonlocal connection between flow densities and fieldstrengths. In the time- and frequency-domain compatible constitutive relations are given and discussed. Consequences on the wave equation are pointed out. (8 refs.)

106657 Finite element steady-state solutions of the traveling magnetic field problem. M.Ikeuchi, H.Niki (Dept. of Appl. Math., Okayama Univ. of Sci., Okayama-shi, Japan), H.Kobayashi.
IEEE Trans. Magn. (USA), vol.MAG-19, no.4, p.1524-9 (July 1983).
The authors are concerned with the stability and accuracy of n-order finite element (FE) steady-state solutions of the traveling magnetic field problem. It is found that the odd-order FE solutions (n is the odd number) are stable under $0<\sigma|u|h/v<f(n)\simeq2.0+1.4(n-1)$, and that the even-order FE solutions (n is the even number) are unconditionally stable. The consistent domain is also proposed, in which the n-order FE solutions are stable and of $2n$-order accuracy. Moreover, three-dimensional cases are dealt with, and the comparison with upwind methods is given. The merit and limits of the n-order FE method are finally cleared. (14 refs.)

106658 To the theory of electromagnetic field contraction. K.A.Barsukov, G.A.Grigoryan.
Izv. Akad. Nauk Arm. SSR Fiz. (USSR), vol.17, no.1, p.3-9 (1982). In Russian.
Using an earlier proposed method of the analysis of cavities having variable boundaries, a simple solution to the problem of magnetic field contraction in a plane nonstationary cavity is given. Simple and clear expressions for the coordinate and time dependences of fields in such a cavity are obtained. The cases of uniform and uniformly accelerated motions of the boundary are considered. The latter case provides an opportunity of following the redistributions of fields in the process of acceleration of the cavity boundary. (8 refs.)

106659 Field singularities at the tip of a cone. J.Van Bladel (Lab. for Electromagnetism & Acoustics, Univ. of Ghent, Ghent, Belgium).
Proc. IEEE (USA), vol.71, no.7, p.901-2 (July 1983).
Data are given on the nature of the singularities near the tip of a sharp metallic cone, and on the structure of the singular fields. Electric and magnetic fields are considered separately, as they become infinite according to different laws. (2 refs.)

41.10H Electromagnetic waves: theory

106660 Electromagnetic field computation in geometries involving non perfectly conducting thick half-planes. V.Daniele, R.Orta (Dipartimento di Elettronica-Cespa, Politecnico di Torino, Torino, Italy), P.L.E.Uslenghi.
Alta Freq. (Italy), vol.52, no.3, p.149-51 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982).
Some methods to solve functional equations which appear in electromagnetic problems involving thick half-planes are proposed in particular when losses or diffraction coefficients are to be computed. One of them is particularly efficient when the thickness is large with respect to the wavelength. (13 refs.)

106661 Using integral equations of the second kind for analysis of diffraction by thin shields. E.M.Inspektorov (Gomel' State Univ., Gomel', USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.10, p.783-5 (Oct. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.10, p.1099-101 (Oct. 1982). [received: Sept. 1983]
Examines whether the integral equation of the magnetic field (Fredholm equation of the second kind) can be used for analysis of thin shields of finite thickness. The two-dimensional problem for H-mode waves is considered. With the shield contour subdivided into N intervals, the integral equation is reduced to a system of N algebraic equations with coefficients S_{pq} (p q=1, 2, ..., N) each an integral of the kernel of the original equation. A numerical evaluation is shown for a shield which has a cylindrical profile of the dimension 4.5λ and rounded edges in front of an E-sectoral horn radiator. The error of this evaluation is estimated. (6 refs.)

106662 Space and time dynamics of formation of resonance-scattered waves. V.A.Buts, Yu.P.Machekhin.
Radiophys. & Quantum Electron. (USA), vol.25, no.10, p.823-7 (Oct. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.10, p.1152-7 (Oct. 1982). [received: Sept. 1983]
The conditions are established under which resonance-scattered waves build up in thick layers and the maximum amplitude of these waves when damping occurs is calculated. Their characteristic buildup time and the dimension of the region which forms them is also determined. (5 refs.)

106663 Analytical study of the scattering properties of a structure consisting of two partially closed cylindrical baffles. V.V.Veremei (Inst. of Radiophys. & Electronics, Acad. of Sci., Ukrainian SSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.10, p.836-43 (Oct. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.10, p.1170-8 (Oct. 1982). [received: Sept. 1983]
The multiple-reflection method is used to obtain an analytical solution for the problem of the diffraction of an H-polarized electromagnetic wave by two partially closed baffles in the form of circular cylinders with a longitudinal slot. The solution makes it possible to estimate the degree of mutual influence exerted by the elements of the structure and to designate the frequency intervals of the excitation field where the problem can be limited to the approximation of isolated scatterers. Particular attention is given to the influence of element interaction on the scattered field in the far zone when quasinormal modes are excited in the structure. (9 refs.)

106664 The transition layer method in the problem of thermal radiation from a rough surface. V.E.Gershenzon, V.Yu.Raizer, V.S.Etkin (Inst. of Space Studies, Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.914-18 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1279-84 (Nov. 1982). [received: Sept. 1983]
Investigates the thermal radiation of a periodically irregular water surface in a quasistatistical approximation. The roughness is modeled by a transition dielectric layer. The authors derive the dependence of the emission coefficient on the amplitude of the irregularity, allowing for the anisotropy of the latter. The model calculation has been confirmed experimentally. (12 refs.)

106665 Intensification of wave back scattering by rough surfaces. V.U.Zavorotnyi, V.E.Ostashev (Inst. of Atmospheric Phys., Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.924-7 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1291-5 (Nov. 1982). [received: Sept. 1983]
The problem of scattering of waves by a set of two areas covered with microroughness is considered. Consideration of mirror reflections between the areas results in intensification of back scattering. It is confirmed that this effect is similar to backscatter intensification in a volume of a randomly inhomogeneous medium, and must also occur for a real two-scale surface. (6 refs.)

106666 Perturbative methods in the electrodynamics of inhomogeneous and nonstationary media (review). V.A.Davydov (Sci.-Res. Inst. of Nuclear Phys., Moscow Univ., Moscow, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.12, p.1010-24 (Dec. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.12, p.1429-48 (Dec. 1982). [received: Sept. 1983]
To find the characteristics of electromagnetic waves propagating in media with variable parameters, the methods of geometrical optics or the WKB method are particularly effective. However, the WKB method is of limited use for the study of radiation from sources, mainly because the quasiclassical solutions of the corresponding wave equations are, in general, nonorthogonal. Therefore, the charge and current densities of sources on the right-hand sides of the equations cannot, as a rule, be expanded in terms of these solutions. The author develops a perturbation theory which makes it possible to calculate, with relative ease, the energy of radiation from sources in inhomogeneous and nonstationary media. (32 refs.)

106667 Scattering of amplitude-modulated waves on bodies of complex form. I.V.Sheinfel'd (Sci.-Res. Radiophys. Inst., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.12, p.1043-6 (Dec. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.12, p.1473-7 (Dec. 1982). [received: Sept. 1983]
Conditions for existence of so-called 'modulation waves' are determined. It is shown that isolation of the modulation wave requires averaging of the scattered field characteristics over fluctuations of the sensing body observation angle. For objects of a more general class, isolation of the modulation wave is possible for a specific form of transmitter-object-receiver channel transfer characteristic, when a channel intensity transfer characteristic exists. (4 refs.)

106668 Scattering coefficients of an infinite circular cylinder excited by a dipole field. T.Ando (Faculty of Engng., Osaka Inst. of Technol., Osaka, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.J66B, no.5, p.655-62 (May 1983). In Japanese.
A general analysis is presented on the electromagnetic wave scattering coefficients of a homogeneous infinite circular cylinder (dielectric and magnetic or conductor) excited by an electric or magnetic dipole field. A numerical result clarifies the relationship between the scattering coefficients and the frequency of incident waves or scattering direction for each natural mode of the cylinder. As the cylinder loss becomes large, the scattering coefficients approach those of a perfectly conductive cylinder. (12 refs.)

106669 Attenuation by rain on Earth-space paths at 13 GHz. R.V.Webber, J.I.Strickland, J.J.Schlesak (Communications Res. Centre, Ottawa, Ontario, Canada).
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.127-33
Rain attenuations on earth-space paths have been measured at several locations across Canada using radiometers at 13 GHz. Average monthly and annual rain attenuation statistics are presented for each location. An analysis of worst month statistics shows clearly the contrasting seasonal occurrences for the various climates. In addition, it confirms that the exceedence probabilities for the average year and worst month can be related by a simple power law that is location dependent. In general, the results show a strong dependence of rain attenuation statistics on climate and little dependence on annual accumulations of rain, number of thunderstorm days or geographic latitude. (3 refs.)

106670 Correlation between various radioelectrical data at 11.4, 11.6, and 35 GHz. D.Vanhoenacker, T.Vinois, J.Meganck, S.Jespers, A.Vander Vorst (Lab. de Telecommunications et d'Hyperfrequences, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.135-9
This paper presents the results of correlation between radioelectrical measurements made on the copolar and crosspolar signals of the OTS beacon at 11.6 GHz, a 11.4 GHz radiometer in two linear polarisations, and a 35 GHz radiometer. All the instruments are oriented in about the same direction. Data obtained in 1981 are computer-processed, looking at correlations both from an event and a statistics point of view. Fluctuations periods of time are also investigated, especially their daily and annual variations. (4 refs.)

106671 Effects of dust/sandstorm on some aspects of microwave propagation. S.Haddad, M.J.H.Salman, R.K.Jha (Dept. of Electrical Engng., Univ. of Technol., Baghdad, Iraq).
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.153-62
The purpose of this paper is to investigate the effects of dust and sandstorms on some aspects of microwave propagation in this region. For this four samples are studied. These are dust from the storm, simulated dust and two sand samples. Diameters, percentage and cumulative % weights of the constituents of the samples are analysed. Dielectric constants of these are measured at 9.35 GHz and forward scattering functions, attenuations, phase shifts, refractive indices and loss tangents are determined. Effects of these, on the propagation of microwaves in dust and sandstorms are explored. Measured attenuations are compared with the calculated values. The effects of storms on radio links and satellite are also studied. (13 refs.)

106672 Measurements and analysis of raindrop size distribution in south western Nigeria. G.O.Ajayi (Dept. of Electronic & Electrical Engng., Univ. of Ife, Ile-Ife, Nigeria), R.L.Olsen.
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.173-84
This paper presents new data on the drop size distribution of tropical rain obtained at Ile-Ife, Nigeria (7.5°N, 4.5°E) using impact-type distrometer. They show a modal type distribution which peaks at fairly large drop diameters (e.g. 2 mm for rain rates above about 50 mm/hr) in approximate agreement with some other data for tropical and sub-tropical locations. This finding has important implications for rain attenuation calculations at EHF and above, where the effect of the small drop portion of the distribution is greatest. A new fitting procedure, called the 'moment regression modelling technique' has been employed with the modified gamma distribution to obtain theoretical models for the measured drop size distribution. The theoretical models are in good agreement with the experimental data. (16 refs.)

106673 Numerical comparisons of space-harmonic and full-wave scattering models. D.M.DeLauder, C.A.Balanis (Dept. of Electrical Engng., West Virginia Univ., Morgantown, WV, USA).
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.291-7
This paper provides a detailed comparison between a space-harmonic model (SHM) and at full-wave model (FWM) for scattering from corrugated rough surfaces. SHM, used here, is valid only for sinusoidal perfectly conducting surfaces, while the FWM can also be utilized for scatterers of any shape and including finite conductivity. The surfaces considered initially are perfectly conducting sinusoids with either vertical or horizontal polarization incident. The respective algorithmic difficulties are considered along with relative advantages (including a discussion of computational efficiency). (7 refs.)

106674 The development and testing of a stochastic variational principle for electromagnetic scattering. J.A.Krill, R.A.Farrell (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).

Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.299-307

Summarizes the development of the vector stochastic variational principle to allow treatment of electromagnetic wave scattering from random objects or surface with arbitrary inhomogeneous and anisotropic permittivity, conductivity, and permeability. In order to examine the accuracy and efficacy of the method, the authors applied it to test random scattering systems. The results show the method to accurately account for polarization effects and for interactive phenomena such as interference and multiple scattering even with simple trial approximations that do not contain these effects. The merits of using a good, yet simple, trial field are discussed in terms of a non-stochastic example. (21 refs.)

106675 A new perturbation expansion for electromagnetic scattering by stochastic surfaces. H.P.Baltes, A.M.J.Huiser (Dept. of Electrical Engng., Univ. of Alberta, Edmonton, Alberta, Canada).

Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.309-13

The authors study the scattering of electromagnetic waves by perfectly conducting plane mirrors with random corrugations in the resonant region. They consider both the calculation of the scattered field in a fixed configuration and the computation of the correlations in the far-field of the waves scattered from an ensemble of surfaces. The starting point of this approach is the set of integral equations for the values of the fields and their normal derivatives on the surface of the mirror. They show that these equations can be solved in terms of a perturbation expansion with the corrugation height h as parameter. This series converges for sufficiently small h. An extension to non-perfectly conducting and dielectric mirrors is possible. The series is tested on a sinusoidal grating. (4 refs.)

106676 Generalized approach to radio wave scatter from time-varying rough surfaces. D.P.Chrissoulidis, E.E.Kriezis (Dept. of Electrical Engng., Aristotelian Univ. of Thessaloniki, Thessaloniki, Greece).

Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.315-21

The theoretical approach to the problem of radio wave scattering from time-varying random rough surfaces is improved by considering a more general model for the scattering surface. A nonstationary and/or nonhomogeneous continuous and real stochastic process is used to describe the elevation of the rough surface from its mean plane. The scattering behavior of this model for the surface roughness is investigated by using standard scattering theories and the quasistationary (QS) approximation. The results of the analysis can lead to a considerably improved prediction of scatter from either partially developed ocean regions or fully developed lakes. (21 refs.)

106677 Scattering and absorption by atmospheric aerosol models. P.W.Barber, P.E.Geller (Dept. of Electrical & Computer Engng., Clarkson Coll. of Technol., Potsdam, NY, USA).

Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.357-62

The T-matrix method is used to calculate the electromagnetic scattering by prolate spheroidal (rod-shaped) particles in fixed orientation and randomly oriented in 3-D. The method can also be used for oblate spheroidal (disk-shaped) particles. The size and refractive index of the spheroids can be selected to model atmospheric particulates at wavelengths of interest. Of particular interest is the depolarization of a plane wave which occurs upon interaction with a system of nonspherical particles. The physical features of a particle are related to the polarized scattering by a parameterization of both particle shape and the elements of the Mueller matrix. The framework which has been developed may be useful in deducing particle characteristics from the measured polarized scattering dependence. (17 refs.)

106678 Backscattering and differential backscattering characteristics of the melting layer. A.W.Dissanayake (European Space Res. & Technol. Centre, Noordwijk, Netherlands), M.Chandra, P.A.Watson.

Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.363-70

An improved model for the radar bright band is presented to characterise the anisotropy observed by dual polarized radars. Constituent particles in the melting layer is considered to be oblate spheroids with eccentricity equal to corresponding melted rain drops except that the axial ratio of smaller particles has a maximum value of 0.9. Partially melted particles were considered as two layered objects and their backscattering cross-sections were evaluated using Waterman T-matrix method. Model predictions were compared with observations made with a dual polarized radar and fairly good agreement was found. (13 refs.)

106679 Layer response to a sinusoidal electromagnetic excitation by an impulse approximation of a thin plate. P.Degauque, Q.T.Nguyen, M.Cauterman (Univ. des Sci. et Tech., Lille, France).

Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.405-10 In French.

The application of electromagnetic methods to geophysical prospecting implies a priori knowledge of the feasibility of such methods when applied to a given site. Three-dimensional numerical methods have been set up to simulate numerically the response of a layer to the excitation from an antenna on the ground surface. The layer response to an impulsive wave is studied, with due account of a possible variation of the conductivity with frequency. The simplification that might result in the computations from an ad-hoc assumption is then evaluated; the assumption consists in assimilating the layer to a thin plate, having a larger conductivity than the embedding medium and presenting some inclination. (4 refs.)

106680 The dependency on the propagation environment of the frequency scaling of attenuation. R.McGuinness, A.R.Holt, B.G.Evans (Dept. of Electrical Engng. Sci., Univ. of Essex, Colchester, England).

Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.425-36

Attenuation ratios on slant paths through rain have been obtained using the dual-polarisation (ZDR) radar database collected in 1981 by the Rutherford Appleton Laboratory. The authors present results for circular polarisation for 14.455/11.786 GHz, 17.5/11.786 GHz, 30.0/20.0 GHz, together with estimates of the effect of the melting band. They also present results for differential (linear) attenuation. (13 refs.)

106681 Experimental and analytical aspects of atmospheric EHF refractivity. H.J.Liebe, D.H.Layton (Nat. Telecommunications & Information Administration, Inst. for Telecommunication Sci., Boulder, CO, USA).

Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.477-86

Absolute attenuation rates and refractivities due to water vapor and moist nitrogen have been measured in the laboratory at 138 GHz, 300K, pressures up to 1.5 atm, and relative humidities up to 100 percent. The computer-controlled measuring system is comprised of a millimeter wave resonance spectrometer (0.15 km effective path length) and a humidity simulator. Several shortcomings of earlier measurement attempts have been rectified. The data are interpreted as a water vapor continuum spectrum consisting of two terms, namely strong self-broadening (H_2O-H_2O) plus foreign-gas-broadening (H_2O-N_2) contributions. Implications of the new results for modeling atmospheric EHF window transparencies and for revising established H_2O line broadening theory are discussed. (23 refs.)

41.70 PARTICLES IN ELECTROMAGNETIC FIELDS: CLASSICAL ASPECTS

(inc. synchrotron radiation)

106682 Interaction of charged particles with an electromagnetic-wave field. B.A.Volodin, A.M.Khapaev (Dept. of Math., Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.1-6 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.3-8 (1982).

A differential equation is obtained relating the energy and coordinate of a charged particle in an interaction with the field of a plane electromagnetic wave of nonunity phase velocity. A method of solving the derived equation allowing the electron energy and coordinate to be analytically elucidated in terms of an introduced parameter using the Weierstrass function is presented. On the basis of the solution of the nonlinear differential equation constructed and the constraints imposed on the parameters of the given system, an expression relating the particle energy and coordinate is obtained. The results of tabulating the expression obtained are compared with the results of numerical integration of the relativistic equations of motion. (7 refs.)

106683 Vector particle in a constant magnetic field. I.A.Obukhov, V.C.Perez-Fernandez (Dept. of Quantum Theory, Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.75-80 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.66-71 (1982).

The relativistic equations of a vector field in an external magnetic field are investigated. The known arbitrariness in choosing the Lagrangian of a vector field in an external electromagnetic field allows the phenomenological parameter k, characterizing the magnetic moment of the particle, to be introduced. The case $k=1$ corresponds to the 1967 Winberg model. In the present work, accurate solutions of the vector equations are obtained both in the case $k=1$ and for arbitrary k. The spin states of the particles are considered. An energy spectrum of a vector particle in a magnetic field agreeing with earlier known results is found. (7 refs.)

106684 General method for solving the self-consistent equations of motion and Maxwell equations. Yu.G.Pavlenko (Moscow State Univ., Moscow, USSR).

Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.946-54 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1319-28 (Nov. 1982). [received: Sept. 1983]

A perturbation theory is developed on the basis of the Hamiltonian formalism for solving the system of field equations and the relativistic equations of motion. An algorithm is obtained for determining the time evolution of any experimentally measured quantity in connection with particle-field interaction. The result of the study is presented in the form of a series, each term of which is associated with a corresponding spontaneous and induced process. First-order effects in the motion of particles in a waveguide are discussed. (14 refs.)

106685 Three-wave parametric processes in electron beams. V.I.Zadorozhnyi, A.M.Fedorchenko (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.235-6 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.381-3 (Feb. 1983). [received: Sept. 1983]

It was shown by Zadorozhnyi and Fedorchenko (1980) that there exist five different types of three-wave parametric processes. Type V, corresponding to a backward wave generator is the best understood, both experimentally and theoretically. Type III processes include the phenomenon of optical parametric generation. Type V or III processes may also occur when electromagnetic and acoustic waves interact parametrically in solids. The experiment described by Davis (1976) in which the electromagnetic (EM) wave traveling opposite to the electron beam is transformed into an EM wave of higher frequency traveling in the same direction as the beam, affords an example of a type IV process. This type of process was analyzed theoretically by Kalmykov et al. (1979) with allowance for retardation effects. Brillouin scattering in a plasma from which particles drift away at supersonic speeds is another example of a type IV process. All five types of three-wave parametric interaction can occur when an EM wave interacts parametrically with a space charge wave in a relativistic electron beam. (9 refs.)

106686 Nonlinear theory of stimulated scattering of electromagnetic waves by a magnetized beam of electrons in a waveguide. M.V.Kuzelev, A.A.Rukhadze, G.V.Sanadze, D.S.Filippychev (P.N. Lebedeev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.247-8 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.396-9 (Feb. 1983). [received: Sept. 1983]

When an electromagnetic wave is scattered by an electron beam, beat plasma oscillations are excited in the latter. However, if the reciprocal of the characteristic time for the amplitude of the beat wave to change is much less than the plasma frequency, there are no eigenoscillations in the beam. This type of scattering is called Compton scattering, and in this case the beat wave causes modulation and bunching of the electron beam. Of course, Compton scattering is possible only for electron beams of sufficiently low density. (4 refs.)

41.80 PARTICLE BEAMS AND PARTICLE OPTICS

(see also 07.80 Electron and ion microscopy, 07.77 Beam handling equipment)

106687 Beam solitons in retarding systems. V.K.Grishin, E.N.Shaposhnikova (Dept. of Nuclear Interactions & Accelerators, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.91-3 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.79-81 (1982).
The authors consider the possibility of propagation of short beams of charged particles (beam solitons) in a retarding system. By using a self-consistent analysis of the nonlinear kinetic equation and the Maxwell equations, the conditions are obtained under which the particles which propagate in a dielectric waveguide are confined by the proper longitudinal field. The possibility is discussed of compression of the beam to durations shorter than one nanosecond by using a transformation of the beam parameters. (3 refs.)

106688 Features of advanced neutron optical devices. H.Rauch (Atominst., Osterreichischen Univ., Wien, Austria).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.71-9 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The features of neutron interferometry and neutron magnetic resonance systems are described. The existence of widely separated coherent beams in perfect crystal neutron interferometry permits a great variety of experiments with matter waves in the field of basic quantum mechanics. For example, the phase of the spatial and spinor wave functions can be measured. Recent results on the 4π-symmetry of a spinor and the first direct verification of the spin-superposition law are discussed. Multiple Laue reflections are used to achieve an angular resolution up to 0.001 sec of arc, which permits the observation of wide slit diffraction effects. Neutron magnetic resonance systems allow a uniform energy shift of the neutrons and may be an important component in the future for the realisation of systems for dynamical neutron polarisation, monochromatisation and focusing of neutrons into certain energy, space, angle or time intervals. Additional advantages exist for pulsed sources, very slow neutrons and highly monochromatic beams. (44 refs.)

41.80D Electron beams and electron optics

106689 Polychromatic MTF of electrostatic point symmetric electron lenses. O.P.Nijhawan, S.K.Gupta, R.Hradaynath (Instruments Res. & Dev. Establ., Dehra Dun, India).
Appl. Opt. (USA), vol.22, no.16, p.2453-5 (15 Aug. 1983).
Electrostatic electron lenses have been evaluated in terms of their image transfer characteristics. The effect of polychromatic radiation with different spectral energy distributions on the performance of an electron emitter-lens combination has been studied. (12 refs.)

106690 Tokamak-like equilibria of relativistic electron beams. Shi Bingren (Southwestern Inst. of Phys., Leshan, Sichuan, China).
Acta Phys. Sin. (China), vol.32, no.4, p.507-14 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
The toroidal equilibrium properties of relativistic electron beams with double-δ function distribution are considered. The approximate solutions of the magnetic flux and the electric potential equations expanded in terms of the inverse aspect ratio of the torus are obtained analytically. The drift surfaces of electrons in the beam are also described. (6 refs.)

106691 The excitation of microwaves by a relativistic electron beam in a dielectric-lined waveguide. M.Shoucri (Production et Conservation de l'Energie, Inst. de Recherche d'Hydro-Quebec, Varennes, Quebec, Canada).
Phys. Fluids (USA), vol.26, no.8, p.2271-5 (Aug. 1983).
The dispersive properties of a relativistic electron beam in a dielectric-loaded waveguide are investigated. The linearized fluid and Maxwell's equations are used to derive the dispersion relation and to study the eigenmodes for the system. The Cherenkov microwave radiation mechanism is investigated. (12 refs.)

106692 Short-range interactions of high-intensity electron beams. V.A.Varrentsov, V.N.Manuilov, Sh.E.Tsimring (Inst. of Appl. Phys., Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.970-6 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1349-57 (Nov. 1982). [received: Sept. 1983]
Considers two variant methods of trajectory analysis of axially symmetric electron beams which permit a significant reduction in the scale at which the beam is discretized without substantially increasing the computation time. The methods are based on a separate calculation of the fields of charges in the beam which are located near the observation point. The authors present the results of a trajectory analysis of helical electron beams, which point out the necessity for including a close-range interaction when there are regular intersections of the electron trajectories and regions of electron beam constriction. 41.80G Ion beams and ion optics

106693 Unified theory of ion optics. H.Nakabushi (Dept. of Phys., Osaka Univ., Toyonaka, Japan), T.Sakurai, H.Matsuda.
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.319-36 (1 Sept. 1983).
A unified theory of ion optics is developed, which can be applied to all ion-optical devices used currently in particle spectrometers. The second-order trajectory calculation has been performed in unified fields consisting of crossed electric and magnetic fields with arbitrary distributions. Nine parameters (in the second-order approximation) are necessary to designate respective ion-optical devices as well as their arbitrary superpositions. Correction for the relativistic effect on particle mass is included, which is necessary for relativistically fast particles. (19 refs.)

42.10 PROPAGATION AND TRANSMISSION IN HOMOGENEOUS MEDIA

106694 Modal analysis of spatially periodic anisotropic media. K.Rokushima, J.Yamakita (Dept. of Electrical Engng., Univ. of Osaka Prefecture, Osaka, Japan), M.Nishimura.
Bull. Univ. Osaka Prefect. Ser. A (Japan), vol.31, no.1, p.25-35 (1982).
A method for analyzing slanted anisotropic gratings is presented. The propagation of electromagnetic waves in the periodic media is expressed by coupled mode equations in a unified matrix form. The solution of the equations is reduced to an eigenvalue problem of the matrix. By introducing the concepts of the transmission and boundary matrices, the diffraction and waveguiding properties of the gratings are obtained rigorously by systematic matrix calculations using typical computer library programs. (12 refs.)

106695 Diffraction characteristics of planar absorption gratings. W.E.Baird, M.G.Moharam, T.K.Gaylord (School of Electrical Engng., Georgia Inst. of Technol., Atlanta, GA, USA).
Appl. Phys. B (Germany), vol.B32, no.1, p.15-20 (Sept. 1983).
Planar (co)sinusoidal conductivity (absorption) transmission gratings are analyzed using rigorous coupled-wave theory. The first-order and higher-order diffraction efficiencies are determined over the entire range of possible conductivities and Bragg angles of incidence (or equivalently, grating periods) for H-mode polarization incident plane waves. The maximum possible first diffracted order efficiency is found to be 5.26%. Rigorous results are compared to approximate results from the Raman-Nath theory and the two-wave first-order coupled-wave (Kogelnik) theory. A regime parameter, ρ_σ is defined which delineates the regions of Raman-Nath diffraction behavior ($\rho_\sigma<1$) and the region of two-wave first-order diffraction theory behavior ($\rho_\sigma>1$). Likewise, the angular selectivity characteristics of conductivity gratings are determined from rigorous theory and are compared with corresponding results from approximate theory. (12 refs.)

106696 Wave beam scattering by a segment of a sphere. O.V.Sulima.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.8, p.57-9 (1983). In Ukrainian.
A rigorous solution is obtained for a problem of Gaussian wave beam scattering by a segment of a sphere arranged near the beam waist. Total and radar cross-sections of scattering versus frequency are calculated. (3 refs.)

106697 The Fresnel number in terms of ray matrix elements. Fan Dianyuan (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Acta Opt. Sin. (China), vol.3, no.4, p.319-25 (1983). In Chinese.
The number of Fresnel half-period zones for complex optical systems is derived. Its formula is $N=(a^2/\lambda)[(A/B)+(1/R)]$. Since it is expressed by the ray matrix elements, there is a universal significance. The authors have introduced a concept of 'effective propagation path' $L_{\mathrm{eff}}=B/A$, which reflects the influence of the optical system on the diffraction field. For several typical systems, concrete expressions of the Fresnel number are given. The imaging properties of the vacuum spatial filter are indicated using the ray matrix theory. The perfect image-relaying conditions are determined. Finally the Fresnel number is extended to the region of complex number, and used to investigate the diffraction problem of a truncated Gaussian beam. (9 refs.)

106698 Two-dimensional Rayleigh scattering in a semi-infinite cylindrical medium exposed to a laser beam. A.L.Crosbie, R.L.Dougherty (Dept. of Mech. & Aerospace Engng., Univ. of Missouri-Rolla, Rolla, MO, USA).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.3, p.255-79 (Sept. 1983).
A modification of Ambarzumian's method is used to develop the integro-differential equations for the source function, flux, and intensity at the boundary of a two-dimensional, semi-infinite cylindrical medium with second order Legendre phase function scattering. The incident radiation is collimated, normal to the top surface, and is dependent only on the radial coordinate. Boundary conditions which vary as a Bessel function and as a Gaussian distribution are investigated. The Gaussian distribution approximates a laser beam. Numerical results are presented in graphical and tabular forms for a Rayleigh scattering medium. The results are compared with those of isotropic scattering. (5 refs.)

106699 Geometrical optics in weakly anisotropic media. M.F.F.Nave, J.Gibbons (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England).
Opt. Acta (GB), vol.30, no.9, p.1245-53 (Sept. 1983).
The propagation of polarized waves in weakly anisotropic media is considered. The geometric optics approximation is used and the ray paths are determined in the approximation that the medium is isotropic. The transport of polarized waves along these rays is described by the first-order approximation; this yields a system of two coupled ordinary differential equations. The effects of birefringence, dispersion and diffraction are given by the second-order approximation. (13 refs.)

106700 Evaluation of the field near a cusp of a caustic. J.J.Stamnes, B.Spjelkavik (Central Inst. for Industrial Res., Oslo, Norway).
Opt. Acta (GB), vol.30, no.9, p.1331-58 (Sept. 1983).
The field in the neighbourhood of a cusp of a caustic can be expressed in terms of a function of two variables, $P(X,Y)$, known as Pearcey's integral or the Pearcey function. The authors develop efficient algorithms for computing this function and its derivatives $\partial P/\partial X$ and $\partial P/\partial Y$. They are based on a

Taylor series expansion in a region close to the cusp at $X=Y=0$, and on asymptotic approximations in regions far from the cusp. The asymptotic results are given in terms of contributions of isolated stationary points in regions far from the caustic, and in terms of the Airy integral function and its derivative in a region close to the caustic. Three terms in the asymptotic expansions are used, and they give an accuracy for $P(X,Y)$ better than 0.006 in amplitude and 0.6° in phase at distances from the cusp greater than $(X^2+Y^2)^{1/2}=4$. (41 refs.)

106701 **Diffraction efficiency of absorption gratings.** T.Jaaskelainen (Dept. of Phys., Univ. of Kuopio, Kuopio, Finland).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.441-6 (Sept. 1983).
The diffraction efficiency of absorpion gratings is investigated using a coupled multiwave analysis. For the four-wave case the analytical expressions for the signal amplitudes are given. The applicability of the four-wave approximation is also included. (11 refs.)

106702 **Experimental improvement of the signal to noise ratio for code detection using the retro-reflective labels.** K.Kiya, T.Hayashi, U.Kato (Univ. of Electro-Communications, Tokyo, Japan).
Rep. Univ. Electro-Commun. (Japan), vol.33, no.2, p.291-303 (Feb. 1983).
Authors have made the experimental studies, on the improvement of the signal light to background light ratio using the retro-reflective labels (Scotch light) and got the following results: (1) The detectability of the reflective signal from the code plates is improved by the high intensity of background light. From this phenomenon, the characteristics of these labels are explained. (2) The background light could be rejected by using the narrow field of view telescope and this effect is specially improved to the weaker signal light detection. (3) Finally, the experimental and analytical confirmations are got for the relations between the width of light pulse and the scanning area to the scanning for the code plates with the ribbon-beam-light. 42.20 PROPAGATION AND TRANSMISSION IN INHOMOGENEOUS MEDIA

106703 **Scattering and absorption of turbid materials determined from reflection measurements. I. Theory.** R.A.J.Groenhuis (Lab. for Materia Tech., State Univ. Groningen, Groningen, Netherlands), H.A.Ferwerda, J.J.Ten Bosch.
Appl. Opt. (USA), vol.22, no.16, p.2456-62 (15 Aug. 1983).
To allow the determination of scattering and absorption parameters of a turbid material from reflection measurements the relation of these parameters to the reflection has been described by two theoretical approaches. One approach is based on the diffusion theory which has been extended to include anisotropic scattering. This result is a reflection formula in which the scattering and absorption are described by one parameter each. As a second more general approach a Monte Carlo model is applied. Comparison of the results indicates the range of values of the scattering and absorption parameters where the computationally fast diffusion approach is applicable. (21 refs.)

106704 **Multiple scattering of optical pulses in scale model clouds.** R.A.Elliott (Oregon Graduate Center, Beaverton, OR, USA).
Appl. Opt. (USA), vol.22, no.17, p.2670-81 (1983). (Topical Meeting on Optical Techniques for Remote Probing of the Atmosphere, Incline Village, NV, USA, 10-12 Jan. 1983).
The results of experiments to measure the delay, temporal stretching, attenuation, and spatial spreading of optical pulses in scale model clouds are reported. The model clouds consisted of diiodomethane/water or paraffin oil/water emulsions maintained in a rotating scattering cell to prevent settling of the droplets. The optical pulses were 532-nm, 25-psec duration pulses generated by a frequency-doubled passively mode-locked Nd:YAG laser and were detected with a 10-psec resolution streak camera. The measurements of the delay in the mean arrival time of the pulses due to multiple scattering are the first measured directly. (20 refs.)

106705 **Scattered light intensity cross correlation. I. Theory.** J.K.G.Dhont, C.G.de Kruif (Van't Hoff Lab. voor Fysische en Colloid Chemie, Rijksuniv. Utrecht Padualaan, Utrecht, Netherlands).
J. Chem. Phys. (USA), vol.79, no.4, p.1658-63 (15 Aug. 1983).
It is shown that in a so-called cross-correlation set up, an experimental technique where two laser beams and two detectors are used, double scattering contributions to the measured intensity correlation function are negligibly small compared to the first order contribution. furthermore, it is shown that the theoretical work of Phillies (1981) concerning this subject is incomplete, due to the use of an incomplete Siegert relation. In doing this, an important second order term is overlooked. The cross-correlation set up is best suited for experiments at 90° scattering angle. At other scattering angles experimental difficulties arise, due to the necessity, as is shown in this paper, to position the two detectors at different angles with respect to the laser beams. (9 refs.)

106706 **Fraunhofer scattering by a sub-fractal diffuser.** E.Jakeman (Royal Signals & Radar Establ., Malvern, England).
Opt. Acta (GB), vol.30, no.9, p.1207-12 (Sept. 1983).
It is shown that the contrast of the far-field intensity pattern, generated by illuminating a small area of a gaussian random diffuser with fractal slope, exhibits a characteristic power-law dependence on illuminated area. (12 refs.)

106707 **Correlation of speckle patterns generated by a diffuser illuminated by partially coherent light.** G.R.C.Reddy, V.V.Rao (Dept. of Phys., Regional Engng. Coll., Warangal, India).
Opt. Acta (GB), vol.30, no.9, p.1213-16 (Sept. 1983).
It is shown that, under some experimental conditions, the speckle pattern generated by a diffuse object transilluminated by a partially space coherent light source suffers no decorrelation when the diffuse object is translated in three-dimensional space. (5 refs.)

106708 **Light scattering by large rough particles.** J.-M.Perrin, P.L.Lamy (Lab. d'Astron. Spatiale, CNRS, Marseille, France).
Opt. Acta (GB), vol.30, no.9, p.1223-44 (Sept. 1983).
A model of light scattering by large rough particles is proposed which is based on the high-energy approximation, the laws of geometrical optics and a mathematical description of the properties of the particles roughness. The calculated intensities and polarizations as functions of scattering angles agree well with experimental results except in the case of metallic particles. (25 refs.)

106709 **Dislocation density on wavefront of a speckle-structure light field.** N.B.Baranova, B.Ya.Zel'dovich, A.V.Mamaev, N.F.Pilipetskii, V.V.Shkunov (Inst. of Mech. Problems, Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.983-8 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1702-10 (Nov. 1982). [received: Sept. 1983]
The dislocation density on the wavefront of a speckle-inhomogeneous light field was investigated experimentally as a function of the beam divergence, shape of the angular spectrum, and degree of spatial modulation. The results are in good agreement with the theory. (17 refs.)

42.30 OPTICAL INFORMATION, IMAGE FORMATION AND ANALYSIS

106710 **Hybrid logic processing in parallel.** H.Bartelt, A.W.Lohmann (Phys. Inst., Univ. Erlangen-Nurnberg, Erlangen, Germany).
Appl. Opt. (USA), vol.22, no.17, p.2519-20 (1983).
It is demonstrated how logic operations, and AND operation, for example, can be implemented by simple spatial filtering using theta modulated objects. Theta modulation is a technique which encodes pixel information, e.g. the intensity by the orientation of a grid structure. An electronic preprocessing system to produce theta modulated pictures in TV quality is described. The combination of the eletronic preprocessing step and the optical spatial filtering system classifies the method as a hybrid electronic-optical procedure. (11 refs.)

106711 **Hipparcos: ESA project with substantial Netherlands participation. II. Optical detectors and data processing.**
Elektronica (Netherlands), vol.31, no.12, p.30-1, 33, 39, 41 (17 June 1983). In Dutch.
Describes the procedure adopted for processing the large amounts of data which Hipparcos is expected to provide, and discusses the use of the opto-electrical converter. Particular attention is paid to the principle of the image dissector tube (IDT). The three main types of IDT are reviewed: (a) electromagnetic deflection and focusing; (b) hybrid IDTs—electromagnetic deflection and electrostatic focusing; (c) electrostatic deflection and focusing. The ITT F4012 (entirely e/m) was chosen for the Hipparcos telescope. Hipparcos is due to be launched at the end of 1986/beginning of 1987 by means of an Ariane-1, -2 or -3 rocket. (no refs.) *D.J.B.*

106712 **Color signal correlation detection by matched spatial filtering.** F.T.S.Yu, T.H.Chao (Electrical Engng. Dept., Pennsylvania State Univ., University Park, PA, USA).
Appl. Phys. B (Germany), vol.B32, no.1, p.1-6 (Sept. 1983).
A polychromatic correlation detection technique by complex spatial filtering is presented. This technique utilizes a diffraction grating and three co-lineared (red, green, and blue) coherent sources. The technique of complex spatial filter synthesis for the polychromatic correlation detection is demonstrated. This technique offers true color correlation detection which is very suitable for color signal recognition and identification. The correlation diffraction efficiency with this technique is generally higher than that of the wavelength-multiplexed technique. Several interesting experimental demonstrations of this color signal correlation detection scheme are provided. Finally the authors note that this color signal detection technique is a simple and versatile processing technique which has a broad range of applications to complex color signal detection, recognition and identification. (10 refs.)

106713 **White-light pseudocolor density encoding by means of one photographic step.** Kang Hui, Li Zhengming (Dept. of Phys., Nankai Univ., China).
Acta Opt. Sin. (China), vol.3, no.4, p.298-302 (1983). In Chinese.
A new technique of white light pseudocolor density encoding is described. The exposure to the object to be processed is performed by means of a Ronchi grating in one step. According to the property of the negative encoding plate 'the higher the transmittance, the lower the modulation', when only the zeroth and the first orders of the spectrum of the grating are allowed to pass.

Positive and negative images have been obtained respectively, and hence contrast reversal realized. After color filtering, the authors accomplished the pseudocolor density encoding. (9 refs.)

106714 Spatial filtering real-time spatial frequency and density pseudocolor encoding. He Mingxia, Liu Zhishen (Dept. of Phys., Shandong Coll. of Oceanology, Qingdao, China).
Acta Opt. Sin. (China), vol.3, no.4, p.303-7 (1983). In Chinese.
A real-time image pseudocolor encoding method for spatial frequency and density encoding is presented. Pseudocolor images are obtained through color spatial filtering at a spatial frequency plane. The spatial frequency pseudocolor encoding is accomplished by two-dimensional color spatial filters. The density pseudocolor encoding is obtained through contrast reversal of the color image, and the contrast reversal is accomplished by two-color halfwave phase filtering. ERTS and airborne remote sensing images are processed directly. Experimental results showed that this method is effective. (10 refs.)

106715 White light optical pseudocolor upon the difference between two photographs. Cai Cikai, Zheng Yi, Yang Hui, Tian Zhiwei (Dept. of Phys., Hangzhou Univ., China).
Acta Opt. Sin. (China), vol.3, no.4, p.308-12 (1983). In Chinese.
An optical pseudocolor encoding method based upon the difference between two photographs is presented. It is shown that the difference between two pictures with a continuous change in gray which is discriminated simultaneously by the eyes, can be detected by use of two sources of different color. The pseudocolor image from the optical system is processed in select-color with differentiation by a video system, so that the signal of difference is enhanced. The theory is in agreement with experiment. Finally, some applications are discussed. (8 refs.)

106716 Optical imaging with resolution exceeding the Rayleigh criterion. J.G.Walker (Royal Signals & Radar Establ., Malvern, England).
Opt. Acta (GB), vol.30, no.9, p.1197-202 (Sept. 1983).
Results are presented of an optical imaging experiment in which resolution in excess of the Rayleigh criterion but in accordance with a recent singular value analysis was achieved. A low Shannon number object was illuminated with coherent light and the diffraction-limited image was sampled over a spatial extent many times larger than the geometrical image size. The enhancement in resolution was achieved by using the iterative spectral extrapolation algorithm, known as the Gerchberg method. (10 refs.)

106717 Self-imaging phenomenon. Lateral shift of Fresnel images. K.Patorski (Inst. of Design of Precise & Optical Instruments, Warsaw Tech. Univ., Warsaw, Poland).
Opt. Acta (GB), vol.30, no.9, p.1255-8 (Sept. 1983).
The conditions determining the lateral localization of Fresnel images of a linear binary amplitude grating with respect to the optical axis are derived. The conditions represent the third basic parameter, besides the axial localization and the lateral magnification, characterizing the diffraction images formed by the self-imaging phenomenon. (12 refs.)

106718 Spatial periodicities in coherent and partially coherent fields. A.W.Lohmann, J.Ojeda-Castaneda, N.Streibl (Phys. Inst., Univ. Erlangen, Erlangen, Germany).
Opt. Acta (GB), vol.30, no.9, p.1259-66 (Sept. 1983).
The propagation of light in free space yields images of a certain class of objects. This effect, discovered 150 years ago by Talbot, is known as 'self-imaging'. The self-imaging phenomenon, or the periodic properties of coherent and partially coherent fields, are described as eigenfunctions of the operator that represents the solution of the Helmholtz equation. Using this simple treatment, the authors state the necessary and sufficient conditions for self-imaging in coherent and partially coherent fields. It is indicated that certain laterally aperiodical, partially coherent fields also exhibit self-imaging properties. The treatment is exact, but it disregards evanescent waves. (15 refs.)

106719 Improvement of chromatic aberration of an aspherical plate corrector for prime focus. Shao Lian-Zhen, Su Ding-Qiang (Nanjing Astron. Instrument Factory, Acad. Sinica, Nanjing, China).
Opt. Acta (GB), vol.30, no.9, p.1267-72 (Sept. 1983).
An illustrative example is given of how the chromatic aberration of a three aspherical plate corrector for prime focus may be reduced greatly as the relative positions of the three plates are changed for various wavelength bands. The conclusion drawn from this is that the chromatic aberration of an optical system can be improved if each of those elements which can be moved are adjusted for different wavelength bands. This method may also be used to reduce the aberrations caused by temperature variations. (8 refs.)

106720 Digital line-artifact removal. T.Peli, J.G.Verly (MIT Lincoln Lab., Lexington, MA, USA).
Opt. Eng. (USA), vol.22, no.4, p.479-84 (July-Aug. 1983).
A variety of imaging procedures generate artifacts which have the visual appearance of a set of parallel lines across the image. The authors present a simple frequency-domain algorithm which considerably reduces this type of artifact. It has been found to be effective in a number of applications, and its performance is illustrated by way of examples. (3 refs.)

106721 Real-time image deblurring using four-wave mixing. Y.H.Ja (Res. Labs., Telecom Australia, Clayton North, Victoria, Australia).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.457-9 (Sept. 1983).
The author proposes a real-time image deblurring method using FWM, based on the well-known deconvolution method, proposed and realized by Stroke and his co-workers (1977). The basis of their method involves spatial filtering using a holographic deconvolution filter where image division in the Fourier transform plane is performed. Since the deconvolution (division) filter is usually recorded on a negative photographic film by controlling γ, the slope in the linear region of the Hurter-Driffield curve of the film, the operation cannot be done in real-time. In FWM, the recording of the hologram and the reconstruction of the image occur simultaneously and are almost in real-time (this time delay is usually very small, depending on the response time of the nonlinear medium used as the recording medium) because the time consuming processing of the film is not required. The author first outlines the general principle of image deblurring, and then describes how FWM operated in the nonlinear region can perform real-time image deblurring. (17 refs.)

106722 Fourier processing with phase-reflection gratings. G.Molesini (Istituto Nazionale di Ottica, Firenze, Italy).
Opt. Lett. (USA), vol.8, no.9, p.465-7 (Sept. 1983).
The use of phase reflection gratings for Fourier filtering in the object space is described, and the optical transfer function for resonance at normal incidence is given. Experiments prove in good agreement with theory. (8 refs.)

106723 Fundamental theory on regeneration of high quality image. T.Iijima (Faculty of Engng., Tokyo Inst. of Technol., Tokyo, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part A (Japan), vol.J66A, no.5, p.394-401 (May 1983). In Japanese.
Gives a rational method for regeneration of high quality image from its corresponding compressed information. The main results are as follows: (1) The integral equation for obtaining an original image from its blurred image is rigorously solved. (2) Using its solution a set of partial interpolation polynomials for the original image is derived as a mathematical formula computable from discrete sampled values of the blurred image. (3) It is proved that the image approximately regenerated by the set of polynomials is continuous and smooth over all the domain. The theoretical results may contribute to establishing the quality advancing technology for various images. (1 ref.)

106724 Line-by-line recursive image restoration based on a non-causal stochastic model. Y.Yoshida, H.Ogura, Y.Sakura (Faculty of Industrial Arts, Kyoto Inst. of Technol., Kyoto, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part A (Japan), vol.J66A, no.5, p.432-9 (May 1983). In Japanese.
Describes an image restoration method for a monochromatic image corrupted by an additive white noise. A mathematical model of the image is represented by a noncausal cross-type stochastic difference equation. The two-dimensional equation is reduced to a set of one-dimensional equations, which are modified for applying Kalman filtering. Computer experiments show that this method gives the noise reduction rates predicted theoretically not only for computer-synthetic images but also for a real image. (7 refs.)

42.40 HOLOGRAPHY

(for acoustic holography, see 43.63)

106725 Fabrication of a 360° astigmatic rainbow hologram. H.Chen, M.Chen (Saginaw Valley State Coll., University Center, MI, USA).
Appl. Opt. (USA), vol.22, no.16, p.2474-7 (15 Aug. 1983).
A 360° astigmatic rainbow holographic recording scheme is proposed. The experimental result is also included. (6 refs.)

106726 UV-holographic gratings in TS-diacetylene single crystals. Spatial resolution and sensitivity. K.H.Richter, W.Guttler, M.Schwoerer (Phys. Inst., Univ. Bayreuth, Bayreuth, Germany).
Appl. Phys. A (Germany), vol.A32, no.1, p.1-11 (Sept. 1983).
Holographic gratings with grating periods between 0.37 μm and 4.4 μm, respectively, were recorded on the surface of TS-diacetylene single crystals by two interfering 257 nm laser beams. Diffraction efficiencies of up to 35% were obtained for read-out with red light of $\lambda=633$ nm. The main modulation mechanism was phase modulation. The spatial resolution was better than 1600 lines/mm. The upper limit of the polymer chain length was 0.6 μm. The holographic sensitivity was 4.5 cm^2/J for immediate read-out at 633 nm without processing after exposure. A weakly exposed latent hologram may be developed simply by gentle annealing the crystal which increases the sensitivity by one order of magnitude. (39 refs.)

106727 Nonlocal photovoltaic response function for the interpretation of hologram writing in ferroelectric crystals. R.von Baltz, C.Lingenfelder (Inst. fur Theorie der Kondensierten Materie, Univ. Karlsruhe, Karlsruhe, Germany), R.Rupp.
Appl. Phys. A (Germany), vol.A32, no.1, p.13-18 (Sept. 1983).
The general properties of the nonlocal relationship between light intensity and bulk photovoltaic current density are studied within the linear response theory. As a result, only the even part of the response function is related to the bulk photovoltaic effect whereas the odd part is connected with diffusion of hot carriers. In addition, the authors present a calculation of the response function for a model of impurity centers in a ferroelectric crystal. They conclude that the characteristic decay length for the response is neither the anisotropy length nor the mean-free path but the hot carrier diffusion length. (31 refs.)

106728 A laser scanner applicable to scanning any graphics. Ye Quanshu, Gao Wenqi (Dept. of Phys., Nanjing Univ., China).
Acta Opt. Sin. (China), vol.3, no.4, p.313-18 (1983). In Chinese.
A type of computer-generated holographic scanner, being able to scan any type of 2-D patterns such as characters, is described. Methods of improving the focusing ability and reversing the scanning direction are introduced and the experimental results are presented. (6 refs.)

106729 Imaging analysis of one-step rainbow holography. Chen Guicong (Dept. of Phys., Shandong Coll. of Oceanology, Qingdao, China), H.Chen.
Acta Opt. Sin. (China), vol.3, no.4, p.326-32 (1983). In Chinese.
Starting from scaler diffraction theory, various possible recording and reconstruction geometries of one-step rainbow holography are analyzed, and quantitative conditions for obtaining orthoscopic or pseudoscopic reconstructed images are derived. (5 refs.)

106730 Design of aberration-reduced holographic gratings for Seya-Namioka monochromators. R.Iwanaga, T.Oshio (Res. Inst. for Atomic Energy, Osaka City Univ., Osaka, Japan).
J. Spectrosc. Soc. Jpn. (Japan), vol.32, no.3, p.166-72 (1983). In Japanese.
A designing method of aberration-reduced holographic gratings has been studied for Seya-Namioka monochromators. Aberrations such as astigmatism, coma and image curvature have been tested analytically without using numerical integration employed in a case of aberration balancing. Satisfying results have been given for both spherical and toroidal gratings. (5 refs.)

106731 The effect of angular selectivity on the monochromatic imaging performance of volume holographic lenses. R.R.A.Syms, L.Solymar (Dept. of Engng. Sci., Univ. of Oxford, Oxford, England).
Opt. Acta (GB), vol.30, no.9, p.1303-18 (Sept. 1983).
Angular selectivity is shown to have a significant effect on the size of objects that may be imaged acceptably by volume holographic lenses, so that a definition of imaging performance based purely on classical lens aberrations may no longer be considered adequate. The performance of single elements and compound systems is examined qualitatively by means of photographs of real and virtual images, and suggestions are made for improvements in performance. (21 refs.)

106732 Fourier spectrum analysis of multi-exposure synthetic holograms. M.Kujawinska (Precision Mech. Dept., Warsaw Tech. Univ., Warsaw, Poland).
Opt. Acta (GB), vol.30, no.9, p.1319-29 (Sept. 1983).
Two methods of determining the localization, spectrum content and distribution of the intensity in the Fourier plane of a product-type multi-exposure hologram are presented. The analytical considerations of the localizations and dimensions of diffraction orders of the spectrum of synthetic interferograms are verified by one- and two-dimensional calculations. (4 refs.)

106733 Coordinate transformations via multifacet holographic optical elements. H.Bartelt, S.K.Case (Dept. of Electrical Engng., Univ. of Minnesota, Minneapolis, MN, USA).
Opt. Eng. (USA), vol.22, no.4, p.497-500 (July-Aug. 1983).
Arbitrarily prescribed space variant operations can be carried out with high efficiency by multifacet holographic optical elements recorded in dichromated gelatin. The authors describe the use of such elements to perform coordinate transformations from Cartesian to polar coordinates. Theoretical calculations of resolution limits and experimental results are given. (6 refs.)

106734 Review of resolution factors in holography. O.D.D.Soares (Centro de Fisica, Faculdade de Ciencias, Univ. do Porto, Porto, Portugal).
Opt. Eng. (USA), vol.22, no.4, p.107-112 (July-Aug. 1983).
High resolution has long been considered one of the achievable advantages in holography. This has induced the pursuit of research on the application of holographic techniques into several fields. Though the holographic principle ensures the feasibility of high resolution of the order of the radiation wavelength and superresolution, in practice, the obtainable resolution in a holographic experiment remains as one of the most complex features to assess. This is a result of the large number of interactive parameters involved and the difficulty of expressing quantitatively their role upon the resolution expected for the implementation of the conceived experiment. A discussion of the factors that affect resolution is reviewed to establish the range of the physical parameters that should define the experimental setup. A systematic procedure to guarantee a desired resolution is presented, as well as its corresponding implications on the experimental design, namely, angular tolerances ranging to orders of microradians. (41 refs.)

106735 Reconstruction by multidirectional holographic interferometry of the concentration field in a supersaturated solution near a growing $NaClO_3$ crystal. F.Bedarida, L.Zefiro, P.Boccacci, C.Pontiggia (Istituto di Mineralogia, Univ. di Genova, Genova, Italy).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.139-43
Holographic interferometry that is usefully applied to check crystal growth from solution on earth, may also be used in a microgravity field. The simplest method is one-directional holographic interferometry that allows a measurement in real time of the concentration averaged on the direction of observation. Multidirectional holographic interferomety is a more sophisticated method that gives a mapping of the concentration in the solution near the growing crystal. (8 refs.)

42.50 QUANTUM OPTICS

106736 Effects of laser fluctuations on the driven Dicke model. R.R.Puri (Dept. of Math., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England), S.V.Lawande.
Physica A (Netherlands), vol.120A, no.1-2, p.43-54 (1983).
The exact steady-state solution is presented for the reduced density operator for a model of N identical two-level atoms on a single site (the Dicke model) driven by a laser field with phase fluctuations. Exact expressions are given for the phase averaged atomic observables and atomic correlation functions of arbitrary order. Results show that the inclusion of phase fluctuations tends to smooth the discontinuities in the observables and their correlation functions found in the nonfluctuating resonant case. Quantum fluctuations are also reduced to the effects of the phase fluctuations and with increasing N, the atomic observables tend to assume their semi-classical value. (31 refs.)

106737 Laser phase and amplitude fluctuations in the fluorescent Dicke model. R.R.Puri (Dept. of Math., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England), S.S.Hassan.
Physica A (Netherlands), vol.120A, no.1-2, p.55-67 (1983).
The authors derive a master equation for the ensemble averaged atomic density operator for a system of N identical superimposed two-level atoms (the Dicke model) driven by an intense, fluctuating laser field of finite phase/amplitude bandwidth by using the theory of multiplicative stochastic processes. It is shown that in spite of the appearance of time-dependent terms, this master equation still describes a Markov process. The quantum regression theorem can, therefore, be used to calculate the fluorescent spectrum which is found to consist of a single Lorentzian located at the central driving laser frequency and a sum of symmetrically displaced Lorentzians. There are broadening and narrowing effects. The intensity correlations are also evaluated. The results are also extended to the case when the atomic system is in n-photon resonance with the phase fluctuating laser field. (14 refs.)

106738 Broadband population inversion. R.Tycko (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.9, p.775-7 (29 Aug. 1983).
A theory is presented for construction of sequences of phase-shifted radiation pulses for coherently inverting populations over a broad band of transition frequencies. Such sequences have applications in nuclear magnetic resonance and coherent optics. Examples of sequences are derived, together with computer simulations of their inversion properties. (13 refs.)

106739 Contribution to the Dicke superradiance theory. Exact solution of the quasi-one-dimensional quantum model. V.I.Rupasov (Spectroscopy Inst., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.989-96 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1711-23 (Nov. 1982). [received: Sept. 1983]
The quantum inverse-scattering method problem is used to show that the Dicke quasi-one-dimensional model of superradiance theory is completely integrable. Commutation relations are obtained for the action-angle variables, and the eigenstates and eigenvalues of the commuting integrals of motion of the model are found. It is shown that the eigenstates of the system include, besides 'continuous' spectrum states corresponding to usual spontaneous emission, also bound complexes of quasiparticles (quantum solitons) that correspond to the Dicke superradiance. (16 refs.)

42.55 LASING PROCESSES

106740 Photolytic dual-media nuclear pumping of excimer lasers. F.P.Boody, M.A.Prelas (Nuclear-Pumped Laser Corp., Kingston, NJ, USA).
AIP Conf. Proc. (USA), no.100, p.349-53 (1983). (Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983).
Presents a novel photolytic nuclear pumping scheme, utilizing concentration of nuclear-pumped excimer fluorescence and a new high-efficiency nuclear pumping source that overcomes nuclear pumping's previous problems of insufficient pumping power density and the deleterious effects of nuclear pumping sources on laser kinetics. Utilizing this scheme should produce absorbed pumping power densities of 50-100 kW/cm^3 in the photolytic laser medium—more than sufficient for long pulse pumping of efficient excimer and excimerlike laser systems. Laser system efficiency should exceed 1%. (5 refs.)

42.55B General theory of lasing action

106741 Influence of seeding radiation on the dynamics of single-pulse laser generation. A.A.Kovalev, B.N.Tyushkevich, V.N.Sadovskii, N.A.Usova.
J. Appl. Spectrosc. (USA), vol.37, no.5, p.1236-41 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.741-8 (Nov. 1982). [received: Sept. 1983]
The method of narrowing the radiation spectrum of single-pulse lasers with active loss modulators based on the creation of narrow-cavity seeding radiation in the laser resonator is very effective, and of great practical value. This method is most simply realized in a laser with two resonators that are optically coupled through an electrooptical gate (EOG), with one resonator serving additionally to form the seeding radiation by free generation up to the moment when the Q-factor is switched on. The influence of the drop in inversion on the behaviour of the frequency and intensity is investigated. (9 refs.)

42.55D CO_2 lasers

106742 Fine tuning of lasers by an intracavity interferometer containing an absorbing gas. J.R.Izatt, P.Mathieu (Lab. de Recherche en Optique et Laser, Univ. Laval, Quebec, Canada).
Can. J. Phys. (Canada), vol.61, no.9, p.1278-83 (Sept. 1983).
Laser emissions can be tuned to an absorption line of a gas if the usual output coupler is replaced by a Michelson interferometer with a cell containing the absorbing gas introduced in one of its arms. For a TEA-CO_2 laser, this method allows one to tune the emission spectrum over a frequency range equal to the width of the gain curve (3.5 GHz) while maintaining the spectral width around 70 MHz. The analysis of such a system is carried out by taking into account anomalous dispersion and saturation of the absorbing gas. This enables one to determine the optimal values of the experimental parameters and to evaluate the tuning range and the energy efficiency of the laser. Many other practical considerations are also discussed in the text. (3 refs.)

106743 Routes to chaotic output from a single-mode, DC-excited laser. R.S.Gioggia, N.B.Abraham (Dept. of Phys., Bryn Mawr Coll., Bryn Mawr, PA, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.650-3 (22 Aug. 1983).
Instabilities in a single-mode, Fabry-Perot, predominantly inhomogeneously broadened xenon laser show progressions through increasingly complicated periodic behavior, ultimately reaching a deterministic chaotic behavior. Period doubling, two-frequency, and intermittency routes to chaos have been observed. (23 refs.)

106744 Noise of He-Cd laser and its suppression. Y.G.Tseng, J.L.Jiang, J.H.Lu, M.S.Chiu (Shanghai Inst. of Laser Technol., Shanghai, China).
Appl. Opt. (USA), vol.22, no.16, p.2484-6 (15 Aug. 1983).
Linear relations have been observed between the reciprocal of the noise ratio and the reciprocal of the output power of the He-Cd laser as well as between the noise ratio and the net gain within the laser cavity. By a feedback method with an acoustooptic modulator in the laser cavity at the Brewster angle for low optical loss, a stable laser with high power output and low noise has been obtained. The noise ratio and the output power are 0.8% and 33 mW, respectively, at 4416 Å. (11 refs.)

106745 XeCl excimer laser excited by longitudinal discharge. Zhenzhuo Zhou, Yongjian Zeng, Mingxin Qiu (Shanghai Inst. of Laser Technol., Shanghai, China).
Appl. Phys. Lett. (USA), vol.43, no.4, p.347-9 (15 Aug. 1983).
XeCl excimer laser excited by longitudinal gas discharge is reported. The main characteristics of the laser output and the laser energy in dependence of the operating parameters were measured. The laser pulse duration was 35 ns and the maximum laser energy 317 μJ with improvement by preionization. (2 refs.)

106746 Gain characteristics of XeCl laser. Chen Jianwen, Fu Shufen, Liu Miaohong, Chao Liming, Guo Weichong (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Acta Opt. Sin. (China), vol.3, no.4, p.364-8 (1983). In Chinese.
Reports the experimental measurement of gain characteristics of a XeCl laser pumped by a Blumlein fast discharge device, using the method of varying the output coupling, according to the relation betweem the output power of the laser consisting of a stable cavity and homogeneously broadened gain medium, and other laser parameters, such as small-signal gain coefficient g_0, constant absorption loss coefficient saturation intensity I_s and cavity length. Finally, the optimum transmittance of the laser is determined. The authors find that the optimum transmittance is a function of pumping power. (6 refs.)

106747 Measuring saturation intensity of the He:Cd laser. M.S.Chiu, Y.G.Tseng (Shanghai Inst. of Laser Technol., Shanghai, China).
Opt. Acta (GB), vol.30, no.9, p.1203-6 (Sept. 1983).
A new method of obtaining the saturation intensity of the He:Cd laser by means of measuring the laser noise is introduced. The value of the saturation intensity of the He:Cd laser at 4416 Å obtained by this method is quite close to that obtained by the determination of the maximum unsaturated gain. (4 refs.)

106748 Probabilities for transition processes crucial to Li lasers. G.Aspromallis, C.A.Nicolaides (Theoretical & Phys. Chem. Inst., Nat. Hellenic Res. Found., Athens, Greece).
Phys. Rev. A (USA), vol.28, no.3, p.1879-82 (Sept. 1983).
The authors present results of electron correlation calculations in the Briet-Pauli approximation for radiative allowed and forbidden transition probabilities of highly excited Li states, contained in recent schemes for short-wavelength lasers. This is the first quantitative prediction for the phenomenon of relativistic radiative autoionization (RAA). RA has already been singled out as a fundamental deexcitation mechanism which might lead to efficient lasing systems. (26 refs.)

106749 Short-cavity hydrogen-halide laser. P.Arrowsmith, J.C.Polanyi, H.H.Telle, B.Yang (Chem. Dept., Univ. of Toronto, Toronto, Ontario, Canada).
Appl. Opt. (USA), vol.22, no.17, p.2716-20 (1983).
Laser action in HCl and HBr with a short-length-cavity TEA laser has been investigated. Support of the discharge by preionization resulted in reliable operation with pulse-to-pulse stability of better than 5%. Both efficient multiline and single-line operation are described. Maximum output energies of 120 and 35 mJ were measured in multiline operation, and 55 and 6 mJ were obtained from a single line for HCl and HBr, respectively. Energy conversion was 0.89 and 0.26% for the HCl and HBr system. (18 refs.)

106750 Continuous-wave HF optical resonance transfer laser model. M.A.Kwok, R.L.Wilkins (Aerospace Corp., Los Angeles, CA, USA).
Appl. Opt. (USA), vol.22, no.17, p.2721-31 (1983).
A nonreactive kinetics model of the flowing gaseous medium of a CW HF optical resonance transfer laser (ORTL) was developed and a parametric study performed. Cross sections were generated for $HF(\nu_1,J_1)+HF(\nu_2,J_2)$ V-V, $R \rightarrow T$, and V-R processes by classical trajectory calculations and by surprisal methods. The ORTL medium model was validated by modeling the reported experimental results of past ORTL experiments. The collisional processes were found to be important in creating positive gain. The study, observing the effects on small signal gain by varying parameters such as pumping laser radiative flux, flux distribution, flow velocity, flow density, and HF mole fractions, has suggested possible regimes of large gain. (20 refs.)

106751 Lasing on the $B \rightarrow X$ band of cadmium monoiodide (CdI) and ^{114}CdI in a UV-preionized, transverse discharge. D.P.Greene, J.G.Eden (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.418-20 (1 Sept. 1983).
Stimulated emission on the $B \rightarrow X$ band of CdI and isotopically enriched (98.6%) ^{114}CdI has been observed in a UV-preionized, transverse discharge device with a gain length of 50 cm. For natural CdI, the laser energy is distributed among several transitions between 656 and 658 nm. The isotopically enriched ^{114}CdI spectrum, in contrast, is dominated by a single line at 657.1 nm, which contains >50% of the output energy. With a high-Q optical cavity, output energies >10 μJ have been measured in a 85-ns full width at half-maximum (FWHM) pulse. (11 refs.)

42.55M Lasing action in liquids and organic dyes

106752 Detection of triplet states in a laser dye from linear and circular polarization studies. T.W.Barrett, J.F.Guiliani (US Naval Res. Lab., Chem. Div., Washington, DC, USA).
Appl. Opt. (USA), vol.22, no.17, p.2522-5 (1983).
Presents a technique based on a polarization study of dye fluorescence. This procedure not only identifies weak triplet-triplet absorption states involved in a dye laser system, but it also allows for the optimum selection of excitation wavelengths with which to more efficiently pump the dye to produce nearly pure singlet emission and thereby to avoid wasted pump energy transfer into the deleterious overlapping triplet band or bands. The technique was tested for the lasing dye, oxazine perchlorate, in an ethanol solvent. Basically, the technique involves the application of the semiclassical oscillator theory in a polarizator study of the polarized fluorescence emission spectrum from a dye excited at a number of selected, narrowband, excitation wavelengths. These wavelengths are used to pump specific portions of the dye absorption band, first under linearly polarized light to detect singlet emission only, and second, under circularly polarized light to detect changes in the spin states (i.e. triplet conversion). (6 refs.)

106753 Dye stability under excimer-laser pumping. II. Visible and UV dyes. V.S.Antonov, K.L.Hohla (Lambda Phys., Gottingen, Germany).
Appl. Phys. B (Germany), vol.B32, no.1, p.9-14 (Sept. 1983).
For pt.I see ibid., vol.B30, p.109 (1983). The stability of laser dyes under the excitation of a XeCl-laser (308 nm) has been investigated. The measurements were performed in an oscillator amplifier device where the amplifier was fully saturated. This allows the comparison with the theoretical model showing that the main reason for dye degradation is the absorption of photo-products. Results for the most important dyes are presented. Dye stabilities range from 46 (fluorescein 27) to 3.4×10^4 (QUI) absorption processes per molecule before the dye solution has degraded to 1/2 of its initial energy output. (2 refs.)

106754 Continuous laser amplification in a monomode fiber longitudinally pumped by evanescent field coupling. B.F.Lamouroux, A.G.Orszag, B.S.Prade, J.Y.Vinet (Lab. d'Optique Appl., Ecole Polytech., Palaiseau, France).
Opt. Lett. (USA), vol.8, no.9, p.504-5 (Sept. 1983).
Amplification of continuous laser radiation propagating in a monomode optical fiber was obtained by evanescent field coupling with a pumped dye solution deposited in the neighborhood of the fiber core. A factor-of-25 signal gain was recorded for 632.80-nm He-Ne radiation and DCM dye solution. (8 refs.)

42.55P Lasing action in semiconductors with junctions

106755 Long-lived GaAlAs laser diodes with multiple quantum well active layers grown by organometallic vapor phase epitaxy. C.Lindstrom, T.L.Paoli, R.D.Burnham, D.R.Scifres, W.Streifer (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.278-80 (1 Aug. 1983).
Proton-defined stripe geometry GaAlAs laser diodes with multiple quantum well active layers grown by organometallic vapor phase epitaxy have been operated continuously at 5 mW/facet for over 1800 h at 70°C and over 1100 h at 100°C. With a 0.7-eV activation energy, these times extrapolate respectively to 11.7 and 47.9 years of continuous operation at 20°C. In the present mode of degradation, the authors estimate that the mean time to double the initial operating current is greater than 138 years at 20°C. (21 refs.)

106756 Superluminescent damping of relaxation resonance in the modulation response of GaAs lasers. K.Y.Lau, I.Ury, N.Bar-Chaim (Ortel Corp., Alhambra, CA, USA), C.Harder, A.Yariv.
Appl. Phys. Lett. (USA), vol.43, no.4, p.329-31 (15 Aug. 1983).
It is demonstrated experimentally that the intrinsic modulation response of injection lasers can be modified by reducing mirror reflectivities, which leads to suppression of relaxation oscillation resonance and a reduction of nonlinear distortions up to multi-GHz frequencies. A totally flat response with a 3-dB bandwidth of 5 GHz was obtained using antireflection coated buried heterostructure lasers fabricated on a semi-insulating substrate. Harmonic distortions were below 40 dB within the entire 3-dB bandwidth. These results are in accord with theoretical predictions based on an analysis which include the effects of superluminescence in the laser cavity. (17 refs.)

106757 Mode-locked semiconductor lasers with gateable output and electrically controllable optical absorber. W.T.Tsang, N.A.Olsson, R.A.Logan (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.339-41 (15 Aug. 1983).
The authors propose and demonstrate for the first time an electronically gateable mode-locked semiconductor laser capable of coding information on the picosecond optical pulses emitted. They further introduced an electronically controllable optical absorber which made it possible to electrically control the optical performance of the mode-locked semiconductor laser. (9 refs.)

106758 Broadly tunable mode-locked HgCdTe lasers. R.S.Putnam, M.M.Salour (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA), T.C.Harman.
Appl. Phys. Lett. (USA), vol.43, no.5, p.408-9 (1 Sept. 1983).
The authors report tunable CW mode-locked laser action from synchronously pumped HgCdTe lasers. 4-8-μm-thick liquid phase epitaxial layers lasing at $\lambda = 1.2$ and $\lambda = 1.73$-2.0 μm are longitudinally pumped by a neodymium:yttrium aluminum garnet (Nd:YAG) laser. Peak output powers of 50 W using a chopped pump beam, and a CW mode-locked average output power of 5.6 mW, have been achieved at a wavelength of 1.2 μm. Nearly bandwidth-limited pulses of 6-ps duration have also been obtained. Tuning from $\lambda = 1.82$ to 2.0 μm via the Burstein-Moss shift has been accomplished on a single epilayer by varying the loss in the external cavity. (8 refs.)

106759 Influence of an external cavity on semiconductor laser phase noise. M.Tamburrini, P.Spano, S.Piazzolla (Fondazione Ugo Bordoni, Roma, Italy).
Appl. Phys. Lett. (USA), vol.43, no.5, p.410-12 (1 Sept. 1983).
Investigation of phase noise in semiconductor lasers allows one to understand the physical processes that influence both the width and the shape of the emission line. Furthermore, the limitations associated with phase noise have to be taken into account when semiconductor lasers are employed in coherent optical communication systems. In this letter the authors report phase-noise measurements on single-mode semiconductor lasers in the presence of optical feedback. They are able to observe, besides the expected linewidth reduction, a peculiar behavior in the high-frequency region not yet reported in the high-frequency region not yet reported in the literature, strongly dependent on the external cavity length. (12 refs.)

106760 Control of mutual phase locking of monolithically integrated semiconductor lasers. E.Kapon, J.Katz, C.Lindsey, S.Margalit, A.Yariv (California Inst. of Technol., Pasadena, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.421-3 (1 Sept. 1983).
The mutual coherence of two coupled semiconductor lasers is investigated experimentally. It is demonstrated that by varying the gain in the overlap region, the degree of phase coherence can be continuously controlled. The quantitative characterization of the degree of phase coherence by fringe visibility is demonstrated. (10 refs.)

106761 Transverse second-order mode oscillations in a twin-stripe laser with asymmetric injection currents. S.Mukai, H.Yajima, S.Uekusa, A.Sone (Electrotetch. Lab., Ibaraki, Japan).
Appl. Phys. Lett. (USA), vol.43, no.5, p.432-4 (1 Sept. 1983).
Transverse second-order mode oscillations in asymmetrically pumped twin-stripe lasers are described. Both far-field patterns and near-field patterns have two peaks, and a stronger peak appears on the weakly pumped side. The dependence of light intensity in one peak of the far-field pattern on the current into one stripe shows threshold characteristics. On application of rectangular pulse to one stripe, switching from one peak to the other occurs within 5 ns. (6 refs.)

106762 Optical stability of narrow stripe, proton-isolated AlGaAs double heterostructure lasers with gain guiding. H.W.M.Salemink, J.W.M.Biesterbos (Philips Res. Labs., Eindhoven, Netherlands).
Appl. Phys. Lett. (USA), vol.43, no.5, p.434-6 (1 Sept. 1983).
Optically stable, proton-isolated, gain-guided (AlGa)As double heterostructure injection lasers are described. A narrow stripe width (3.5 μm) and a very shallow implantation are employed (1.3 μm from the active layer); this results in a $\cosh^{-2}$-like optical mode of $\sim$9.0-μm full width at half-maximum. The far-field profiles possess strong sidelobes at high optical output power. The optical material loss coefficient and the antiguiding parameter are derived from the measured far-field profiles, using the theory of gain guiding. Key parameters in the description of the optical mode distribution are calculated for several values of output power. (5 refs.)

106763 Above-threshold current leakage effects in stripe-geometry injection lasers. K.A.Shore (Dept. of Electrical Engng. & Electronics, Univ. of Liverpool, Liverpool, England).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.371-9 (Sept. 1983).
Lateral current-spreading in stripe-geometry injection lasers is treated in the above-threshold range of device operation. The model represents an extension of previous formalisms which have concentrated on analysing current leakage in the absence of lasing action. The present analysis is used to examine the characteristics of devices with a range of current-spreading parameters and is suitable for assessing the significance of current leakage effects, particularly for mode-stability properties, in stripe-geometry lasers. Furthermore, the description of multi-stripe-geometry lasers requires a consistent model for current-spreading in the above-threshold regime. (11 refs.)

106764 Temporal coherence characteristics of InGaAsP laser diode with single-longitudinal-mode oscillation. Y.Yamabayashi, M.Saruwatari (Yokosuka Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Kanagawa-ken, Japan).
Opt. Lett. (USA), vol.8, no.9, p.506-8 (Sept. 1983).
Temporal coherence characteristics of the InGaAsP laser diode in the single longitudinal mode are measured using an unbalanced Michelson interferometer. It is demonstrated that the coherence characteristics can be expressed by the sum of the Fourier transformation of a spectral fine structure, which consists of a main mode and two adjacent submodes. These submodes cause the coherence length to be shorter than would be expected if direct line width measurements were made. (5 refs.)

106765 Lead chalcogenide tunable diode lasers. D.Dadarlat, R.M.Candea, P.Fitori, A.Darabont (Inst. de Tehnologie Izotopica si Moleculara, Cluj-Napoca, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.35, no.6, p.546-66 (1983). In Rumanian.
A brief view on the specific physical (band structure; temperature and pressure dependence of the refractive index and of the cavity length) and technological (single crystal growth; p-n junction, thermal and electrical contacts manufacturing, shock isolation, temperature and injection current stabilisation) problems connected with the lead chalcogenide diode lasers, is presented. The peculiarities of the laser emission in lead chalcogenides are analysed, stressing the tuning mechanisms (compositional, by temperature, injection current, pressure, magnetic field) and the influence of the variations of the tuning parameters on the laser emission in Pb-salt diode lasers. The up-to-date performances concerning resolution, emitted power, tuning range, stability in time, threshold current and maximum operation temperature are discussed. A summary of the application areas is given. (81 refs.)

42.55R Lasing action in other solids

(inc. solid Raman lasers)

106766 Using superluminescence to improve ultrashort-pulse characteristics. L.S.Kornienko, N.V.Kravtsov, Yu.P.Yatsenko (Sci. Res. Inst. of Nuclear Phys., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.40-4 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.37-41 (1982).
A solid-state laser with a filter operating under conditions of overlap of the saturation stages of the active medium and the nonlinear absorber, with large amplification factors of the active medium, is considered. It is shown that the superluminescence arising under these conditons, which reduces the need for precise maintenance of the optimum level of pumping, may facilitate an increase in the probability of obtaining stable ultrashort pulses with high contrast. (9 refs.)

106767 Passive Q-switch with color centers for neodymium lasers. A.Lupei, V.Lupei, F.Domsa, S.Georgescu, V.I.Manzatu, I.Ursu (Central Inst. of Phys., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.6, p.525-8 (1983).
Properties of a crystalline passive Q-switch based on F_2^- color centers in LiF are presented. Preparation, spectroscopic and Q-switching characteristics (in a YAG:Nd laser) are given. Energies of 50-60 mJ in pulses of 15-20 nsec have been obtained. (6 refs.)

106768 Laser glass. T.Izumitani, H.Toratani.
Solid State Phys. (Japan), vol.18, no.5, p.287-96 (May 1983). In Japanese.
Radiative and non-radiative properties of rare earth ions in various kind of glasses and their site variation due to inhomogeneous structure of glass are reviewed. (33 refs.)

106769 Oxide and halide laser glasses. M.J.Weber (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.2-3, p.239-50 (1983). In English. (Otto-Schott-Colloquium on the State of Optical Glass Research 1982, Jena, Germany, 1982).
Optical and spectroscopic properties of oxide and halide glasses are compared for optically-pumped laser applications. Properties considered include the transparency, linear and nonlinear refractive indices, and damage threshold of the host glass and the absorption spectrum, radiative and nonradiative transition probabilities, fluorescence wavelength, stimulated emission cross section, and spectroscopic inhomogeneities of the lasing ion. Most of these properties exhibit systematic variations with glass composition which can be used to tailor laser parameters. Measured properties for the ${}^4F_{3/2}\rightarrow{}^4I_{11/2}$ lasing transition of Nd^{3+} are surveyed for oxide (silicate, phosphate, borate, germanate, tellurite), halide (fluoroberyllate, fluoroaluminate, fluorozirconate, fluorohafnate, chloride), and oxyhalide (fluorophosphate, chlorophosphate) glasses. 42.55T Free electron lasers

106770 Unstable electrostatic beam modes in free-electron-laser systems. H.P.Freund, P.Sprangle (Naval Res. Lab., Washington, DC, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1835-7 (Sept. 1983).
The electrostatic stability of the free-electron laser is studied for a configuration in which a relativistic electron beam propagates through combined helical wiggler and axial guide fields. Instability is found for certain specific parameter regimes which, in the beam frame, is shown to be purely growing and to require the presence of both the wigler and axial guide fields. The electrostatic stability is also studied for a configuration which consists of a linearly polarized wiggler and an axial guide field, for which analogous results are found. (14 refs.)

106771 Photon statistics of the free-electron-laser startup. W.Becker, J.K.McIver (Dept. of Phys. & Astron., Univ. of New Mexico, Albuquerque, NM, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1838-40 (Sept. 1983).
The authors show that, for the high electron currents used in present-day free-electron lasers, spontaneous radiation is distributed according to thermal statistics. (8 refs.)

106772 Generation of high power, very coherent radiation by interaction of a free electron laser with a molecular (or ionic) medium. H.Wilhelmsson, H.G.Gustavsson (Inst. for Electromagnetic Field Theory, Chalmers Univ. of Technol., Goteborg, Sweden), L.Stenflo.
Phys. Scr. (Sweden), vol.28, no.2, p.205-8 (Aug. 1983).
Intense, very coherent electromagnetic radiation can, in principle, be generated by the interaction of a relativistic electron beam and a molecular medium in the presence of a wiggler field (or a strong electromagnetic pump wave). Enhanced spatial growth in a narrow frequency region results from the presence of the molecules as demonstrated in graphs from computer calculations. These effects are found to occur when the molecules (or ions) have inverted populations, i.e. for maser or laser media, as well as for situations where this is not the case, i.e. when the molecules act like micro-cavities (passive resonators), distributed over the volume of interaction. (10 refs.)

106773 Two-dimensional analysis of the Raman-type free-electron laser. T.Nakashima, T.Shiozawa, H.Morita (Faculty of Engng., Osaka Univ., Suita, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.6, p.439-46 (June 1983). In Japanese.
The authors consider a class of the Raman-type free-electron laser utilizing a two-dimensional relativistic electron beam of finite thickness enclosed by two perfectly conducting planes. For this type of laser the problem of coupling between the positive-energy scattered wave and the negative-energy electron plasma wave under the influence of an electromagnetic pump wave is discussed. From a numerical estimate of the spatial growth rate for the scattered wave, the finite sizes of the beam thickness and the separation between two conducting planes are found to bring several significant modifications in the oscillation characteristics of this type of laser. (13 refs.)

42.60 LASER SYSTEMS AND LASER BEAM APPLICATIONS

106774 Measurement of discharge circuit distributive inductance for Blumlein excimer laser. Chen Jian-wen, Xia Kang-min, Liu Miao-hung, Zhong Fan (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, China).
Acta Phys. Sin. (China), vol.32, no.4, p.548-52 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
The technique of measuring discharge current of Blumlein circuit using magnet-light method is described briefly in this paper. The more exact method estimating distributive inductance of discharge circuit is presented. The circuit equations are solved and the analytic expression of distributive inductance is derived. Finally, the calculated result is discussed. (4 refs.)

106775 Metrological features of a laser device with a single-mirror deflecting unit. A.A.Ivanov, G.M.Maksimov, Yu.S.Nechaev (Inst. of High-Energy Phys., Serpakhov, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1482-5 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.151-3 (Nov.-Dec. 1982).
The features of the readout systems are considered for the laser device for recording graphics information with a one-mirror deflecting unit. The couplings between the systems and the nonlinearity are examined. The calibration procedure is described. Results are given from an examination based on the calibration program together with data on the stability of the calibration constants. The device provides coordinate determination with a mean-square error of about 3-5 μm. (4 refs.)

42.60B Design of specific laser systems

106776 Seventeen psec pulses from a nitrogen laser-pumped short-cavity rhodamine 6G dye laser. G.W.Liesegang (US Nat. Inst. of Health, Lab. of Tech. Dev., Bethesda, MD, USA).
Appl. Opt. (USA), vol.22, no.16, p.2405-7 (15 Aug. 1983).
Reports the generation of 17-psec pulses of 200-kW intensity from a nitrogen-pumped rhodamine 6G short-cavity dye laser. This dye laser has a cavity length of 120 μm and is axially pumped by the nitrogen laser. (8 refs.)

106777 Simple ruby laser producing variable pulse lengths from 800-psec to 80-nsec duration. B.Gellert (Res. Center, Brown Boveri et Cie Baden-Dattwil, Switzerland), C.Heupts.
Appl. Opt. (USA), vol.22, no.17, p.2709-11 (1983).
Remote control of ruby laser pulse length could be achieved over 2 orders of magnitude. The technique for generating such a variability of pulse lengths with the same laser makes use of well-known cavity dumping and mechanical or simple electronic modifications. Short pulses could be lengthened by increasing the parallel capacity of a laser-triggered spark gap. (9 refs.)

106778 Wavelength multiplexing of 1.31-μm InGaAsP buried crescent laser arrays. J.P.van der Ziel, H.Temkin, R.A.Logan (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.401-3 (1 Sept. 1983).
A monolithic array of five noninteracting buried crescent lasers has been optically multiplexed using an external cavity with a grating as a dispersive element. The lasers have a center to center separation of 8 μm, and with an external cavity consisting of a 4-mm focal length lens and a 600-line/mm grating used in second order, the lasers emit at $\approx$1.31 μm in essentially single longitudinal modes separated by 19.6 Å. Single longitudinal mode operation has also been obtained using a cleaved coupled cavity (C^3) laser array. In this case the dominant mode is determined by the coherent interference of the mode spectrum of the two subcavities. (12 refs.)

106779 Selective low-temperature mass transport in InGaAsP/InP lasers. A.Hasson, L.C.Chiu, T.R.Chen, U.Koren, Z.Rav-Noy, K.L.Yu, S.Margalit, A.Yariv (California Inst. of Technol., Pasadena, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.403-5 (1 Sept. 1983).
A low-temperature mass transport process in InP was investigated. Mass transport of InP was achieved at 570-600°C in a closed ampoule using iodine or InI as a catalytic transporting agent. Accomplishing the mass transport process at lower temperature has eliminated the problem of thermal etching and resulted in lasers with higher T_0. (7 refs.)

106780 Twisted double-heterostructure GaAs-(AlGa)As laser. T.Sugino, S.Wang (Dept. of Electrical Engng. & computer Sci., Univ. of California, Berkeley, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.427-9 (1 Sept. 1983).
A novel laser structure in which a terraced substrate laser and a channeled substrate laser are connected is fabricated. The active layer of the composite cavity is twisted in the junction area between the two laser cavities. Internal reflection and polarization change occur in the twisted region. A built-in refractive index variation is formed by the terraced substrate and the channeled substrate structures. Remarkable characteristics of the laser are a low threshold current of 40 mA, a stable fundamental transverse-mode and single longitudinal-mode oscillation, and a wavelength locking over a temperature range of more than 6°C. (11 refs.)

106781 A 1.59 μm wavelength GaInAsP/InP distributed feedback laser with first-order grating on anti-meltback layer. S.Uchiyama, K.Iga (Res. Lab. of Precision Machinery & Electronics, Tokyo Inst. of Technol., Yokohama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L348-9 (June 1983).
A 1.59 μm wavelength GaInAsP/InP distributed feedback laser with a first-order grating has been fabricated by a two-step liquid phase epitaxial (LPE) growth. The first-order grating was formed on the anti-meltback layer grown on the active layer. The threshold current was 680 msA for 18 μm stripe width and 510 μm cavity length and single-longitudinal-mode operation was obtained from -50 to 0°C. (10 refs.)

106782 A dye laser synchronously pumped by Ar$^+$laser. Liu Yupu, Zhang Yinghua, Zhang Guoxuan, Fu Baoxiang (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Acta Opt. Sin. (China), vol.3, no.4, p.333-8 (1983). In Chinese.
The parameters for acousto-optic mode-locking of an Ar$^+$-laser are investigated. Stable mode-locked operations at 4880 Å and 5145 Å have been obtained. The average power is up to 300 mW. The pulse-width is about 200 ps. The fluctuation of the pulse amplitudes is less than 5%. A dye laser with an astigmatically compensated cavity synchronously pumped by this Ar$^+$-laser has been operated. Its pulse-width is less than 10 ps, and the average power is about 20 mW at 5840 Å. The pulses of the mode-locked dye laser are wavelength tunable over the range 5700$\sim$6200 Å. Particularly, the effects of the mismatch of the cavity length or frequency on the mode-locking behaviour are emphasized. (4 refs.)

106783 A folded tunable single-mode TEA CO_2 laser with two beams. Zhou Yueliang, Chen Zhenghao, Cui Dafu, Lu Huibin (Inst. of Phys., Acad. Sinica, Beijing, China).
Acta Opt. Sin. (China), vol.3, no.4, p.339-43 (1983). In Chinese.
This laser can produce two beams which have the temporal coincidence of the pulses. Each beam can be tuned by grating independently within the range of 9.2 μm$\sim$10.9 μm. The highest peak powers of the single-mode/single-line output and the multi-mode/single-line output are about 1 MW and 4 MW respectively. The authors discuss the optimum transmittance and the mode selection of this laser and the temporal coincidence of the pulses. Some experimental results are given. (6 refs.)

106784 GaAs-(AlGa)As large optical cavity lasers. Zhang Xingde, Ren Dacui (Changchun Coll. of Optics & Fine Mech., Changchun, China).
Acta Opt. Sin. (China), vol.3, no.4, p.358-63 (1983). In Chinese.
GaAs-(AlGa)As large optical cavity lasers have been fabricated using a liquid phase epitaxy method and its main parameters, have been measured, such as laser pulse power, beam divergence angle, wavelength and external differential quantum efficiency etc. (11 refs.)

106785 Small-size CO_2 laser with transverse high-frequency excitation. Sh.Kh.Zakirov, A.T.Mirzaev, A.A.Sipailo, V.A.Stepanov, M.Sh.Sharakhimov (Tashkent State Univ., Tashkent, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1473-5 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.143-5 (Nov.-Dec. 1982).
Two versions of the construction of sealed-off small-size CO_2 lasers with tubes made from technical quartz and ceramics with capacitive high-frequency excitation systems in a mixture of CO_2, N_2 and He are described. The parameters of these lasers are compared with the parameters of DC CO_2 lasers. (4 refs.)

106786 Subnanosecond pulse generation of 193 nm radiation by pulse slicing. D.A.Jaroszynski, T.A.King (Phys. Dept., Schuster Lab., Manchester Univ., Manchester, England).
J. Phys. E (GB), vol.16, no.9, p.862-5 (Sept. 1983).
An optical gate and associated techniques are described for the generation of subnanosecond UV radiation from pulsed lasers. Pulses of 400 ps duration at 193 nm have been produced by pulse slicing the output of an ArF laser using a KDP electro-optic modulator driven by a krytron-cable voltage pulse generator. (14 refs.)

106787 Mode matching for a passive resonant ring laser gyroscope. T.D.Baxter, T.T.Saito, G.L.Shaw, R.T.Evans, R.A.Motes (US Air Force Acad., Colorado Springs, CO, USA).
Appl. Opt. (USA), vol.22, no.16, p.2487-91 (15 Aug. 1983).
An analytical method of matching the mode of an input laser to the lowest-order mode of a passive resonant ring laser gyro is described, as are the steps in determining the location and focal length of cylindrical mode matching lenses. Results were obtained with no mode matching, with a compromise spherical lens, with horizontal mode matching only, and with the proper cylindrical mode matching lenses. Compared with no mode matching, the latter case shows that the amplitude of the lowest-order mode is increased $\sim$2.5 times. In addition, the number and intensity of higher-order modes are reduced to near zero, and the relative intensity of the lowest-order mode to the higher-order mode increased from $\sim$5 to $\sim$60 times greater. (5 refs.)

106788 Optical resonators with Gaussian reflectivity mirrors: misalignment sensitivity. N.McCarthy, P.Lavigne (Inst. Nat. de la Recherche Sci., Univ. de Quebec, Varennes, Quebec, Canada).
Appl. Opt. (USA), vol.22, no.17, p.2704-8 (1983).
An analytical solution to the problem of the misaligned optical resonator with a Gaussian reflectivity mirror is presented. It is shown that the fundamental mode of such a resonator remains a Gaussian beam which propagates along a tilted axis in the misalignment plane. The exact analytical solution yields simple expressions that characterize the misalignment sensitivity of the resonator by giving the beam-steering angle and the loss variations. (17 refs.)

106789 The generation of ultrashort laser pulses. G.H.C.New (Dept. of Phys., Imperial Coll. of Sci. & Technol., London, England).
Rep. Prog. Phys. (GB), vol.46, no.8, p.877-971 (Aug. 1983).
Ultrashort laser pulses are finding increasing application in numerous branches of science and technology. This article is an attempt to provide a comprehensive review of the whole field of ultrashort pulse generation, covering both the experimental and the theoretical aspects of the subject. By far the commonest method of generating pulses in the picosecond and subpicosecond regime is the technique known as 'mode-locking' and it is with this that the review is therefore largely concerned. After introductory remarks and a simple treatment of some of the general principles, the central sections of the review deal with the main generic techniques, namely spontaneous mode-locking, active mode-locking (including mode-locking by synchronous pumping) and passive mode-locking. Within each section the material is organised into three main categories, namely (a) general background, (b) historical survey (mainly relating to experimental work and densely packed with references to published work) and (c) theoretical methods (presented with a strongly pedagogical flavour). A major section at the end deals with a mass of important (and mostly recent) work that does not fit naturally into the main framework of the review. This includes USP generation in semiconductor lasers, a number of special methods such as injection mode-locking (and others where two or more mode-locking techniques are combined), as well as chopping and switching techniques. (490 refs.)

42.60H Optical problems related to properties and interactions of laser beams

106790 Bistable operation of a dual-wavelength synchronously mode-locked CW dye laser. I.S.Ruddock, R.Illingworth (Dept. of Phys., Univ. of Strathclyde, Glasgow, Scotland).
Appl. Phys. B (Germany), vol.B32, no.1, p.7-8 (Sept. 1983).
Bistable operation of a dual-wavelength synchronously mode-locked CW dye laser is reported. Wavelength switching is found to depend on the pump power and the dye laser cavity lengths. (5 refs.)

106791 Precise measurement of laser power using calorimetric method. T.Honda, M.Endo.
J. Soc. Instrum. & Control Eng. (Japan), vol.22, no.6, p.508-21 (June 1983). In Japanese.
Calorimetric methods for precise measurement of laser power are surveyed, and a new double calorimeter designed to establish the CW laser power measurement standard is discussed. The double calorimeter consists of a standard thermopile unit (conduction-type calorimeter) having fast response and an electronic-cooling calorimeter (isothermal-type calorimeter) of which the thermal load is borne by the thermopile unit. In a description of the principle of the double calorimeter, the substitution ratio of DC power for laser power (which is termed the effective efficiency) in the thermopile unit is defined. The thermopile unit and the electronic-cooling calorimeter are operated simultaneously, and the effective efficiency of the thermopile unit is determined. (26 refs.)

106792 Plastics for high-power laser applications: a review. R.M.O'Connell, T.T.Saito (Frank J. Seiler Res. Lab., US Air Force Acad., Colorado Springs, CO, USA).
Opt. Eng. (USA), vol.22, no.4, p.393-9 (July-Aug. 1983).
Reviews studies of single- and multiple-shot laser damage to plastics and theories of the damage mechanism. Single-shot damage is caused by absorbing defects, many of which can be eliminated by monomer purification. Multiple-shot damage is controlled by viscoelastic properties; plasticization improves damage resistance. Also, the authors review high-power laser studies of dye-impregnated plastics. Photobleaching is the most serious problem. The authors review progress in understanding the physics of that process. Dye-induced lowering of laser damage resistance and thermal bleaching are other important problems discussed. Plasticization to improve multiple-shot damage resistance may encourage thermal bleaching. Finally, the authors present a list of as yet untested and potentially damage-resistant commercially available plastics. (51 refs.)

106793 On the nature of the accumulation effect in laser-induced damage to optical materials. A.A.Manenkov, G.A.Matyushin, V.S.Nechitailo, A.M.Prokhorov, A.S.Tsaprilov (Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Opt. Eng. (USA), vol.22, no.4, p.400-4 (July-Aug. 1983).
Features of multiple-shot laser-induced damage to optical materials are analyzed. The methodology of studying the accumulation effect responsible for catastrophic damage, based on the statistical approach, is suggested, and the basic characteristics of multiple-shot damage are introduced. Possible mechanisms of microdamage in materials under multiple laser irradiation are discussed. The experimental data on the laser-induced damage to optical polymer materials which demonstrate some basic properties of the accumulation effect are presented. The ways of suppressing the accumulation effect in transparent polymers which result in a considerable increase of laser damage resistance are proposed. (42 refs.)

106794 Multiple pulse laser-induced bulk damage in crystalline and fused quartz at 1.064 and 0.532 μm. L.D.Merkle, M.Bass, R.T.Swimm (Center for Laser Studies, Univ. of Southern California, Los Angeles, CA, USA).
Opt. Eng. (USA), vol.22, no.4, p.405-10 (July-Aug. 1983).
Reports bulk damage measurements on single crystal quartz and two types of fused silica under single and multiple pulse laser irradiation at 1.064 μm and 0.532 μm. Whereas the single pulse damage threshold varies little among the materials or with wavelength, the multiple pulse induced damage behavior depends strongly upon material and wavelength. Laser calorimetry and measurements of light scattered during irradiation give no evidence of change prior to the pulse on which macroscopic damage occurs. However, the distribution of the number of pulses needed to produce macroscopic damage as a function of intensity is indicative of an accumulation process in which some minimum intensity is required to initiate the accumulation of microscopic damage. (14 refs.)

106795 Single and multiple pulse catastrophic damage in diamond-turned Cu and Ag mirrors at 10.6, 1.06 and 0.532 μm. N.Koumvakalis, C.S.Lee, M.Bass (Center for Laser Studies, Univ. of Southern California, Los Angeles, CA, USA).
Opt. Eng. (USA), vol.22, no.4, p.419-23 (July-Aug. 1983).
The results of single and multiple pulse damage studies at 10.6, 1.06, and 0.532 μm in diamond-turned bulk Cu and diamond-turned electro-deposits of Ag on Cu are presented. The single pulse damage threshold decreases or remains constant with increasing spot size, as previously reported. On the other hand, the multiple pulse threshold increases with increasing spot size. The difference in their behavior suggests that the two phenomena are the result of different mechanisms. Localized surface defects and impurities appear to be responsible for single pulse damage, while for multiple pulse damage a model is proposed based on the cumulative effect of plastic deformation induced by thermal stresses. (8 refs.)

106796 Picosecond damage studies at 0.5 and 1 μm. M.J.Soileau, W.E.Williams, E.W.Van Stryland, T.F.Boggess, A.L.Smirl (Dept. of Phys., North Texas State Univ., Denton, TX, USA).
Opt. Eng. (USA), vol.22, no.4, p.424-30 (July-Aug. 1983).
The laser-induced damage (LID) thresholds of fused silica and single crystal NaCl were studied at wavelengths of 0.5 and 1 μm for pulses as short as 4 ps for a variety of focal spot sizes. The problem of sample-to-sample variation was minimized by performing parametric studies on a single sample at a time. Beam distortion measurements and polarization dependence studies of the LID thresholds demonstrate that the contribution of self-focusing to the LID measurements was negligible. The damage threshold field E_B was found to increase as the pulsewidth was decreased in both materials at both wavelengths. The strongest pulsewidth dependence observed was approximately an inverse square root proportionality observed in NaCl at 1 μm for pulses shorter than 10 ps. For conditions of equal pulsewidth and the same focal spot size, E_B was less at 0.5 μm than at 1 μm for both materials. (22 refs.)

106797 Bulk and surface damage thresholds of crystals and glasses at 248 nm. F.Rainer, W.H.Lowdermilk, D.Milam (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Opt. Eng. (USA), vol.22, no.4, p.431-4 (July-Aug. 1983).
The authors used 20 ns, 248 nm pulses to study surface and bulk damage in bare, polished samples of UV-transmitting glasses, fluoride crystals, and isomorphs of potassium dihydrogen phosphate (KDP). The intent was to test enough samples to establish the safe operating limits for currently available windows and crystals finished by routine techniques for optical fabrication. In fluoride crystals, thresholds for bulk inclusion damage and for rear-surface damage were comparable. The median rear-surface threshold was 16 J/cm^2. The fluence limit in fused silica windows was determined by the threshold for rear-surface damage, which ranged from 5 to 9 J/cm^2. For the isomorphs of KDP, the limiting fluence was the threshold for front-surface damage, which ranged from 3 to 9 J/cm^2. (6 refs.)

106798 Continuous wave laser damage on optical components. J.R.Palmer (TRW Inc., Redondo Beach, CA, USA).
Opt. Eng. (USA), vol.22, no.4, p.435-46 (July-Aug. 1983).
Continuous wave laser damage on optical components is a major problem encountered in the operation of high energy chemical lasers. Although the damage phenomena on cooled and uncooled optical components are very similar to those on pulsed laser devices, mechanisms of damage are different. Unlike pulsed laser systems, maintenance of optical figure due to thermal distortion becomes an important aspect of the complete optical train for a device that may be required to operate for a number of seconds. The author deals with damage mechanisms on cooled and uncooled optical components and how the damage may be predicted. Further, predictive tools for determining the thermal and mechanical forces that operate on optical components to induce distortions in the optical train are evaluated. (31 refs.)

106799 The efficiency of coupling light from a laser diode into an optical fiber with the aid of a lens. W.Nakwaski (Politech. Lodz, Lodz, Poland).
Rozpr. Electrotech. (Poland), vol.28, no.1-2, p.233-45 (1982). In Polish. [received: Aug. 1983]
The analysis of radiative losses during laser diode-optical fiber coupling is the subject of the paper. It enables one to calculate an efficiency of coupling as well as showing how this efficiency can be increased with the aid of a suitable change of system parameters. (16 refs.)

106800 Reconstruction of the intensity distribution of heating radiation from the thermal damage profile of a thin plate. I.S.Spevak (All-Union State Sci.-Res. Inst. of Metrology, Khar'kov, Ukrainian SSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.245-6 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.394-6 (Feb. 1983). [received: Sept. 1983]
It was proposed by Appolonov et al. (1978, 1979) that the spatial intensity distribution of light be determined by measuring the induced thermal deformation of a mirror-like surface irradiated by high-power laser radiation. The author suggests employing a thin transparent plate instead of using a mirror as the sensitive element. It is possible by using a plate to increase the maximum measurable intensities without sacrificing the advantages characteristic of the thermodeformation method. This is because in most cases the fraction of radiation absorbed by the plate is less than that absorbed by a mirror. Thus for NaCl plates the absorbed energy is $\sim$0.2% at $l=1$ cm, $\lambda=10.6$ μm (it is proportional to $\gamma l+2\beta$, where γ and β are the bulk and surface absorption coefficients and l is the thickness of the plate); on the other hand, $\approx$1% of the radiation is absorbed when light is reflected from an aluminum mirror. Even though rather large amounts of heat can be shed by cooled porous mirrors, there are technical reasons why it may be preferable to use a transparent plate (the measurements are obviously simpler and can be carried out anywhere in the optical system without disrupting operation, etc.). (5 refs.)

106801 Effects of the coupling hole and tube diameter on the output power of an RF-excited CW HCN laser. H.Ute, I.Okabayashi, M.Makiuchi, M.Kawamura (Faculty of Engng., Tokyo Inst. of Technol., Tokyo, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.6, p.480-1 (June 1983). In Japanese.
Experimental studies of effects of the coupling hole and the tube diameter on the output power of an RF-excited CW HCN laser have been performed. It has been found that there exists an optimum hole diameter for the maximum output and that the output power increases with the tube diameter. (2 refs.)

106802 Improved welding penetration of a 10-kW industrial laser. A.S.Kaye, A.G.Delph, E.Hanley, C.J.Nicholson (UKAEA Culham Lab., Abingdon, England).
Appl. Phys. Lett. (USA), vol.43, no.5, p.412-14 (1 Sept. 1983).
The weld penetration of a multikilowatt CO$_2$ laser has been increased by reducing the laser beam divergence. This near diffraction limited laser has now demonstrated that CO$_2$ lasers are capable of full-penetration welding of 1-in. steel with typically 11 kW on the work. Bead-on-plate tests combined with previous data indicate that the penetration scales with laser power as $P^{0.8}$. (5 refs.)

106803 Blue green lasers and their military potential. V.V.Rampal (Defence Electronics Applications Lab., Dehradun, India).
Def. Sci. J. (India), vol.33, no.2, p.183-93 (April 1983). [received: Aug. 1983]
An overview of the state of art regarding the research and development of lasers in the blue green region of the spectrum is presented. Possible application of these lasers in the area of underwater detection, ranging, and submarine communication, is discussed. (15 refs.)

106804 Methodology of lidar probing of atmospheric temperature from Raman spectra. S.A.Danichkin.
J. Appl. Spectrosc. (USA), vol.37, no.5, p.1249-53 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.757-62 (Nov. 1982). [received: Sept. 1983]
Remote-sensing determination of the physical and chemical parameters of the atmosphere is quite practicable on account of the development of lidar prob-

ing methods and apparatus. Temperature measurement still represents a complicated problem, however. Recently, the pure rotation PR spectrum in Raman scattering RS has been used with air molecules, as the intensity distribution is dependent on the temperature. The resultant method has already found practical use. Nevertheless, the author's studies refine and extend the method by improving the performance. (12 refs.)

106805 Optically-steered twin-stripe laser beam scanner. K.A.Shore (Dept. of Electrical Engng. & Electronics, Univ. of Liverpool, Liverpool, England).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.461-2 (Sept. 1983).
A stripe-geometry injection laser configuration has been described in which the optical near-field position may be controlled by adjusting currents injected through two stripe contacts (1981). The response time for the device in this mode of operation is constrained by the speed at which modulation of the injection currents may be achieved and also by the time taken for changes in the injection current to be communicated to the optical field. Although the limitations imposed by these factors may not be serious in many applications it is of interest to examine alternative methods for implementing the scanning function of the device. The author points out that optical injection can provide a mechanism for fulfilling the suggested scanning application for the twin-stripe laser. Used in this way the device may be considered as a component of an all-optical processing system and potential gains in speed of response are made available. (5 refs.)

42.65 NONLINEAR OPTICS

106806 Nonlinear birefringence in fluids containing nonspherical molecules. I. Response and mode coupling theory. D.Ronis (Dept. of Chem., Harvard Univ., Cambridge, MA, USA).
Physica A (Netherlands), vol.120A, no.1-2, p.369-87 (1983).
The orientation density in nonequilibrium systems is expressed in terms of equilibrium time-correlation functions to quadratic order in the gradients in density, pressure and velocity fields. These are evaluated by mode coupling theory in the reversible bare vertex approximation at infinite dilution of the nonspherical component and using a two-variable model prediction for the two-point orientation correlations. A very simple nonlinear correction term is found, predicting no nonlinear shear birefringence and a nonlinear acoustic birefringence which scales as $\Omega I^{1/2}/\Gamma$ with respect to the linear birefringence (Ω is the driving frequency, I is a dimensionless acoustic intensity and Γ is the equilibrium orientation relaxation rate). (20 refs.)

106807 The fifth order susceptibility calculus of alkali metal vapours. I.M.Popescu, N.N.Puscas, P.E.Sterian, I.Baranovski (Polytech. Inst. of Bucharest, Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.5, p.383-8 (1983).
Presents a method for the evaluation of the fifth order susceptibility of alkali metals vapours, considering only the step processes induced by the incident laser field. The Eicher model takes into account the spin-orbit coupling and the damping effect utilising also the oscillator strengths for the calculation of the dipole matrix element. The obtained values $\chi^{(5)}=1.3410.10^{-44}$ esu are in accordance with other published results. (17 refs.)

106808 Resonant interaction of the noise radiation with a two-level system. G.M.Krochik (Sci. Res. Inst. of Intermediate Organic Products & Dyes, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.10, p.812-22 (Oct. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.10, p.1138-51 (Oct. 1982). [received: Sept. 1983]
The behaviour of a two-level system in a strong Gaussian noise field with an arbitrary width of the spectrum is studied. It is shown that the relaxation of the average difference of populations takes place quasiperiodically rather than exponentially. As the intensity of field fluctuations increases, the oscillation frequency tends to the Rabi frequency. The stationary value of the population difference as a function of the ratio between the correlation times of the random field, transverse and longitudinal relaxation, and the deviation of the frequency from resonance are studied, as well as the phase relaxation. It is established that the correlation function for the density matrix of the transition in a strong noise field carries out oscillations which are related to the oscillations of the population difference. The corresponding spectrum of the transition contains a dip whose magnitude increases with increasing intensity of the field fluctuations. A comparison with the results of other work is made. (17 refs.)

106809 Optical generation of control signals in adaptive systems. M.A.Vorontsov, V.I.Shmal'gauzen (Moscow State Univ., Moscow, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.10, p.843-9 (Oct. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.10, p.1179-87 (Oct. 1982). [received: Sept. 1983]
Discusses adaptive focusing systems for radiation in a nonlinear, optically inhomogeneous medium. Spectral criteria are introduced for an estimate of the focus quality based on an analysis of the scattered field within the receiving aperture. Methods are proposed which enable one to generate control signals for a wavefront corrector using optical filtering of the scattered radiation. (6 refs.)

106810 Line shape of spontaneous resonance hyper-Raman scattering of intense optical fields. L.Kancheva, S.Rashev (Inst. of Solid State Phys., Sofia, Bulgaria).
Spectrosc. Lett. (USA), vol.16, no.7, p.489-97 (1983).
The authors present some preliminary theoretical investigations on the multicomponent structure of the resonance spontaneous hyper-Raman spectrum from a four-level system. The central result is the demonstration of the 13-component spectral structure, and the establishment of certain general conditions for its appearance. (13 refs.)

106811 Six-wave interaction in liquid crystal mesophase. N.V.Tabiryan, S.G.Odulov.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1152-5 (Aug. 1983). In Russian.
Efficient degenerate six-wave interaction of low-power beams of CW gas lasers due to the fifth-order orientational optical nonlinearity of liquid crystals is predicted. Nonlinear susceptibility is evaluated for the geometry of interaction where ordinary third-order nonlinearity does not occur, $\chi^{(5)}\approx 10^{-6}$ cm^6/erg^2, which is 10 orders higher than that of semiconductor materials with two-photon absorption. (5 refs.)

106812 Temperature effects in $AgGaS_2$ nonlinear devices. G.C.Bhar (Phys. Dept., Burdwan Univ., Burdwan, India), D.K.Ghosh, P.S.Ghosh, D.Schmitt.
Appl. Opt. (USA), vol.22, no.16, p.2492-4 (15 Aug. 1983).
Refractive indices of $AgGaS_2$ crystal are measured at different temperatures using the classical minimum deviation technique and are fitted in appropriate dispersion relations. The variation of pump laser wavelength for noncritical upconversion of signal at 10.6 μm with the change in crystal temperature has been verified using the above data. Temperature tunable infrared generation by noncritically phase-matched difference-frequency mixing has been predicted from 3 to 18 μm. (22 refs.)

106813 Efficient SHG of IR radiation by guided waves in MNA. G.I.Stegeman, C.Liao (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA).
Appl. Opt. (USA), vol.22, no.17, p.2518-19 (1983).
The efficiently produce blue light by second harmonic generation (SHG), a high power density fundamental beam must be propagated over long distances in a highly nonlinear material in a phase-matched geometry. One of the most nonlinear materials reported to date is 2-methyl-4-nitroaniline (MNA) with $d_{11}=2.3\times10^{-10}$ m.V(vs$d_{33}=4\times10^{-11}$m/V for $LiNbO_3$). However, the large dispersion in refractive index with wavelength in this material ($n_x=1.8$ at $\lambda=1.06$ μm and $n_x=2.2$ at $\lambda=0.53$ μm) has precluded use of this coefficient for phase-matched SHG with plane waves. In a guided wave context, this dispersion can be compensated for by the well-known dispersion with thickness, as first suggested by Levine et al. (1979) It is shown in their work on the nonlinear properties of MNA. It is shown numerically that there exists at least one geometry and a set of mode parameters which lead to very efficient doubling of IR radiation in MNA. (7 refs.)

106814 Interpretation of Livermore third-harmonic-generation experiments. R.S.Craxton (Lab. for Laser Energetics, Univ. of Rochester, Rochester, NY, USA).
Appl. Opt. (USA), vol.22, no.17, p.2739-42 (1983).
Third-harmonic-generation experiments at the Lawrence Livermore National Laboratory were recently reported by Linford et al. [Appl. Opt., vol.21, p.3633 (1982)]. Here the theory pertaining to these experiments is discussed in detail. The Livermore results are shown to be in accordance with calculations using the harmonic generation code MIXER, whose predictions of highly efficient frequency tripling were first confirmed experimentally at the University of Rochester using the Type II/Type II polarization-mismatch configuration. The Livermore experiments confirm the advantages of this configuration. (9 refs.)

106815 Angular distribution and bandwidth effects observed in stimulated Raman emission. D.J.Brink, D.Proch, K.L.Kompa (Max-Planck-Inst. fur Quantenoptik, Garching, Germany).
AIP Conf. Proc. (USA), no.100, p.325-33 (1983). (Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983).
Presents and discusses the results of two experiments, namely: a) a study of the spatial quality of anti-Stokes stimulated Raman scattering (AS-SRS) generated light and b) an investigation on the impact of excitation bandwidth on that of the shifted radiation and on the efficiency of conversion. (18 refs.)

106816 Picosecond light-pulses tunable from the violet to the near infrared. F.Wondrazek, A.Seilmeier, W.Kaiser (Phys. Dept. E11, Tech. Univ. Munchen, Munchen, Germany).
Appl. Phys. B (Germany), vol.B32, no.1, p.39-42 (Sept. 1983).
System parameters of an optical parametric generator pumped by the third harmonic of a Nd:glass laser are presented. The tuning range extends from 5700 to 22700 cm^{-1}; i.e. it covers a frequency range of 17000 cm^{-1}. Experimental data on spectral bandwidths, conversion efficiencies, and pulse shape are discussed. A pump beam with a divergence of four degrees simultaneously generates the entire visible spectrum (blue to red) separated by the angle of emission. (9 refs.)

106817 Second harmonic wave coherent Raman mixing in $LiIO_3$ crystal. Liang Peihui, Gu Zhongmin, Zhang Geiqing (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China), Liu Songhao.
Acta Opt. Sin. (China), vol.3, no.4, p.289-97 (1983). In Chinese.
By pumping a $LiIO_3$ crystal with a 1.06 μm picosecond laser pulse train at a proper incident angle, 8 stimulated Raman scattering lines have been obtained

in the visible region from 4896 Å to 6119 Å:$\omega=2\omega_1 \pm n\omega_P$, $n=1, 2, 3$, concerned elementary excitations being the *LO* mode and *TO* mode of the $(A+E_1)$ oblique polariton in the crystal. The process of such a complex stimulated Raman scattering is as follows: with phase matching the intense 1.06 μm laser beam and its scattered light generate SHG in the crystal; meanwhile it excites coherently the elementary excitations of the crystal, the latter scatter the SHG into Stokes and antiStokes radiation resulting in a complex effect of $\chi^{(2)}$ and $\chi^{(3)}$ nonlinear optical processes. Furthermore the reflected stimulated Raman scattering with distinct wavelength has been observed from the forward one. The reflected scattering is also the SHG coherent Raman mixing but generated by the 1.06 μm beam reflected upon the exit crystal surface. (13 refs.)

106818 Some features of second-harmonic generation in sequentially positioned nonlinear crystals. B.V.Bokut, N.S.Kazak, A.T.Malashchenko, Yu.A.Sannikov.
J. Appl. Spectrosc. (USA), vol.37, no.5, p.1242-5 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.748-52 (Nov. 1982). [received: Sept. 1983] (4 refs.)

106819 Correlation of intensities in the Rayleigh scattering of light. N.I.Lebedev (Dept. of Quantum Radiophys., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.45-7 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.41-3 (1982).
The correlation of light intensities in the quasielastic scattering of two-beam pumping is investigated. It is shown that the fields scattered in different directions will be statistically related under two different conditions of spatial synchronism. The relation between this effect and the effect of correlation of the Stokes and anit-Stokes components of Raman scattering is considered. (5 refs.)

106820 Second-harmonic photons from the interaction of free electrons with intense laser radiation. T.J.Englert, E.A.Rinehart (Dept. of Phys. & Astron., Univ. of Wyoming, Laramie, WY, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1539-45 (Sept. 1983).
A preliminary experimental investigation of the generation of second-harmonic photons from the interaction of free electrons with an intense laser beam has been performed. Second-harmonic photons with a wavelength of 530 nm generated from the interaction of free electrons with 1060-nm photons from a neodymium-glass laser are implied by observing Doppler-shifted photons with wavelengths of 490 and 507 nm. The observed photon wavelengths result from a Doppler shift of the laser photon wavelength as viewed in the rest frame of the electrons, combined with a Doppler shift of the second-harmonic photon emitted from 1600- and 500-eV electrons. Comparison of experimental results with those predicted by cross sections, derived from classical and quantum electrodynamics, shows reasonable agreement with both theories. Although second-harmonic photons are created, the dynamics of second-harmonic-photon generation (accelerated electron motion due to the electromagnetic field or actual two-photon interaction with the electron) cannot be resolved without further experiment. (22 refs.)

106821 Antisaturation in stimulated Raman emission. B.Fain (Chem. Dept., Tel Aviv Univ., Ramat Aviv, Tel Aviv, Israel).
Phys. Rev: A (USA), vol.28, no.3, p.1843-4 (Sept. 1983).
It is shown that in the regime of the Raman laser, at the threshold of its excitation, the absorption of the driving field has a singularity. (9 refs.)

106822 Raman scattering of light by stationary nonlinear polarization waves. T.M.Makhviladze, M.E.Sarychev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.952-8 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1650-60 (Nov. 1982). [received: Sept. 1983]
It is shown that new light-scattering regimes should arise in the case of Raman scattering of light in a medium in which optical solitons are propagating. Investigation of the formation and evolution of Stokes pulses has revealed the dependences of their principal characteristics on the scattering length and on the density of the molecules. The feasibility of the transformation of ultra-short pulses by utilizing optical solitons is considered for single-photon absorption solitons and stimulated Raman scattering solitons. (17 refs.)

106823 Nonlinear optical properties of semiconductors due to phonon flows. E.P.Pokatilov, V.M.Fomin.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1155-62 (Aug. 1983). In Russian.
Based on the collision integral calculation in the equation of motion for a density matrix of band charge carriers, the spectrum of polarization due to the response of the carriers to a strong electromagnetic field is obtained for the case of nonequilibrium phonon distributions. The tensor is found describing the second harmonic field generation caused by the presence of phonon flows in the semiconductor. The optimum conditions for this effect to reveal itself are studied. An increase in the second harmonic field per unit length due to deformational and piezoelectric interactions is calculated for InSb and CdS crystals. It is shown that, in contrast to the optical effects under conditions of equilibrium phonon distributions, the spatial symmetry of an electron-phonon interaction may be directly investigated by means of the second harmonic field generation in the presence of phonon flows. The examined nonlinear optical effects in semiconductors may be used to study the phonon flows detecting electromagnetic waves. (16 refs.)

106824 Nonlinear absorption of electromagnetic waves in crystals with large dielectric constant caused by SBS. G.N.Burlak, A.L.Kalapusha, N.Ya.Kotsarenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1162-5 (Aug. 1983). In Russian.
Nonlinear absorption of electromagnetic waves caused by stimulated Brillouin scattering (SBS) is investigated theoretically in crystals with large dielectric constants ($SrTiO_3$, $KTaO_3$). Coefficients of nonlinear absorption and threshold values of the fields are obtained. Their dependence on the coefficients of sound reflection from crystal boundaries is presented. A comparison of nonlinear losses caused by SMS and other parametrical mechanisms is given. (6 refs.)

106825 Degenerate four-wave mixing due to intervalance band transition in *p*-type mercury cadmium telluride. S.Y.Yuen (Francis Bitter Nat. Magnet Lab., MIT, Cambridge, MA, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.479-81 (1 Sept. 1983).
Degenerate four-wave mixing in *p*-type HgCdTe has been observed with CO_2 lasers. A room temperature third order nonlinear susceptibility $\chi^{(3)}$ of 8×10^{-6} esu has been measured. This is the largest $\chi^{(3)}$ with picosecond relaxation time reported. The observed nonlinearity is interpreted in terms of the effective mass change induced by the transition from the heavy to light hole band. This process is shown to be stronger than the nonlinearity caused by the saturation of the intervalence band absorption. (20 refs.)

106826 Dependence of the efficiency of resonant four-wave interaction on the frequency difference of the pumping waves. A.A.Afanas'ev.
J. Appl. Spectrosc. (USA), vol.37, no.5, p.1245-9 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.752-7 (Nov. 1982). [received: Sept. 1983]
Recently, there has been intensive development in the investigation of wavefront rotation (WFR) of light fluxes in four-wave interactions (FWI) in nonlinear media. Particular attention has been paid to the FWI process in resonant media, allowing not only considerable reflective indices ($R\gg1$) to be obtained, but also the spectrum of reflected radiation to be effectively controlled. On account of the nonlinear interaction of the signal wave with one of the pumping waves, an amplitude-phase lattice is induced in the medium, and the diffraction of the second pumping wave on this leads to the generation of a wave with WFR with respect to the signal wave. If the frequencies of the pumping wave and the signal wave coincide (degenerate FWI), then the process of wavefront rotation occurs without change in frequency. The author investigates the WFR of weak radiation with resonant FWI in the field of specified pumping waves of different frequency. (12 refs.)

106827 Nonlinear optics with a diode-laser light source. D.A.B.Miller, D.S.Chemla, P.W.Smith (Bell Labs., Holmdel, NJ, USA), A.C.Gossard, W.Wiegmann.
Opt. Lett. (USA), vol.8, no.9, p.477-9 (Sept. 1983).
The authors report results of CW degenerate four-wave mixing experiments on room-temperature GaAs-GaAlAs multiple-quantum-well material using a commercial semiconductor diode laser as the sole light source. With CW powers of $\sim$3 mW and intensities of $\sim$13 W/cm^2, the authors observe diffraction efficiencies of $\sim10^{-4}$, corresponding to an effective nonlinear coefficient of $\chi^3\sim6\times10^{-2}$ esu. (8 refs.)

106828 Continuous-wave self-pumped phase conjugator with wide field of view. J.Feinberg (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA).
Opt. Lett. (USA), vol.8, no.9, p.480-2 (Sept. 1983).
A self-pumped phase conjugator is demonstrated that operates over a wide field of view, phase conjugates separate images without cross talk, and when pumped by one incident beam will self-oscillate with mirrors placed in all four quadrants. The phase conjugator uses a single crystal of $BaTiO_3$. (8 refs.)

106829 Storage and time reversal of light pulses using photon echoes. N.W.Carlson, L.J.Rothberg, A.G.Yodh (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA), W.R.Babbitt, T.W.Mossberg.
Opt. Lett. (USA), vol.8, no.9, p.483-5 (Sept. 1983).
The authors have studied in the temporal profile of photon-echo signals generated by combined gated CW and pulsed dye-laser excitation of the inhomogeneously broadened, 555.6-nm absorption line of ^{174}Yb vapor. The authors find that the echo profile is, after time reversal, essentially identical with that of the first excitation pulse. The authors give a new analysis of this effect. Since time-reversed pulse reproduction should also occur in inhomogeneously broadened solid samples, and since the authors observe time-reversed reproduced pulses up to 4% as intense as the input pulse, this effect may have important applications in optical signal-processing systems. (6 refs.)

106830 Spin dependence of optical dephasing in ruby: the frozen core. A.Szabo (Div. of Electrical Engng., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
Opt. Lett. (USA), vol.8, no.9, p.486-7 (Sept. 1983).
Measurements of the $^4A_2(-3/2)$ to $\bar{E}(-1/2)$ optical dephasing time in ruby are obtained for the first reported time and compared with the previously studied $^4A_2(-1/2)$ to $\bar{E}(-1/2)$ transition. Frozen-core effects reduce the ratio of dephasing times $T_2(-1/2)/T_2(-3/2)$ to 1.5 from the value 7.6 expected from a simple magnetic tuning rate consideration. (15 refs.)

106831 Three-wave mixing and nonlinear optical transients in the space domain. D.S.Ray (Dept. of Chem. Phys., Indian Assoc. for the Cultivation of Sci., Jadavpur, Calcutta, India).
Phys. Rev. A (USA), vol.28, no.3, p.1841-2 (Sept. 1983).
Three-wave mixing equations under parametric approximation have been recast in the form of Bloch equations for optical modes and a new echo analog of optical transient in the space domain is predicted. (10 refs.)

106832 Self-focusing and self-modulation of electromagnetic waves in semiconductor with superlattice. A.P.Tetervov (Inst. of Semiconductor Phys., Acad. of Sci., Lithuanian SSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.875-82 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1231-9 (Nov. 1982). [received: Sept. 1983]
The study deals with propagation of nonlinear electromagnetic waves through the current plasma in a semiconductor with a superlattice. The conditions for self-focusing and self-channeling of a nonlinear wave propagating within a small vicinity of Stark resonance are established and the respective characteristic lengths are determined. The self-modulation of one-dimensional nonlinear waves is also considered. The fundamental equations are shown to admit solutions in the form of solitons. (11 refs.)

106833 How to specify and select transparent EC coatings. C.Bright (Optical & Conductive Coatings, Pacheco, CA, USA).
Photonics Spectra (USA), vol.17, no.7, p.35-6, 38-9 (July 1983).
For pt.I see ibid., vol.17, no.6, p.37-43 (1983). Typical optical, electrical and environmental performance requirements of metallic and metallic oxide transparent electroconductive (EC) coatings are compared with manufacturers' data to determine suitability of coatings for each of the major application types. Special capabilities and technology required of EC coating manufacturers when doing heating and EMI shielding applications are examined citing a specific design example in each case, and preparing specifications for these examples. Finally, these specifications are used in a hypothetical evaluation/selection analysis. (2 refs.)

106835 Refractive-index dispersion for BaF_2-GdF_3-ZrF_4-AlF_3 glasses. S.Mitachi, T.Miyashita (NTT Ibaraki Electrical Communication Lab., Ibaraki-ken, Japan).
Appl. Opt. (USA), vol.22, no.16, p.2419-25 (15 Aug. 1983).
Refractive-index dispersion measurements were performed on bulk specimens of 2-, 4-, or 6-mol% AlF_3 doped $33BaF_2$-$4GdF_3$-$63ZrF_4$ (mol%) glass and 4-mol% LiF, CsF, YF_3, CdF_2, SnF_2, or PbF_2 doped $31.68BaF_2$-$3.84GdF_3$-$60.48ZrF_4$-$4AlF_3$ (mol%) glass in the wavelength region from 0.4047 to 5.3036 μm. The material dispersion curve and zero material dispersion wavelength were estimated on the basis of refractive-index dispersion measurements. The slope of the material dispersion curve for these fluoride glasses was less steep than that for SiO_2 glass in the wavelength range estimated. The zero material wavelength λ_0 shifted to a shorter wavelength with increasing AlF_3 concentration. The λ_0 is 1.675 μm for $31.68BaF_2$-$3.84GdF_3$-$60.48ZrF_4$-$4AlF_3$ (mol%) glass. When 4-mol% LiF, CsF, YF_3, CdF_2, SnF_2, or PbF_2 were doped into these glasses, each λ_0 shifted from 1.675 to 1.670, 1.668, 1.673, 1.681, 1.683, or 1.704 μm, respectively. The temperature dependence values of the refractive-index dispersion and material dispersion for $31.68BaF_2$-$3.84GdF_3$-$60.48ZrF$-$4AlF_3$ (mol%) glass were also obtained. The temperature coefficients of the refractive index were negative values ($dn/dT_{\mathrm{relative}} = -1.0\times10^{-5}/°C$) and the wavelength dependence of dn/dT was small. The wavelength λ_0 shifted from 1.675 to 1.605 μm, due to the rise in the measurement temperature from 25°C to 250°C. (15 refs.)

106836 Recent advances in optical fiber materials. P.C.Schultz.
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.2-3, p.215-25 (1983). In English. (Otto-Schott-Colloquium on the State of Optical Glass Research 1982, Jena, Germany, 1982).
This review summarizes important new results in optical fiber materials and processes, concentrating on published reports of the past year. Included are high deposition rate/large size preforms made by RF-plasma inside vapor deposition (IVD) and outside vapor deposition(OVD), all-vapor-deposited singlemode fibers made by OVD and VAD, and a 6 dB/km fiber made by sol gel techniques. New oxide glasses include Ta_2O_5, Sb_2O_3, and Al_2O_3-doped silicas (the latter 0.7 dB/km), and a 13 dB/km Sb_2O_3-GeO_2 fiber. A very active research field is fluoride glass fibers with potentially 10^{-3} dB/km losses: a record 21 dB/km ZrF_4-based glass fiber is reported made by direct melt techniques, as well as data on impurity absorption, optical dispersion, viscosity, strength and fatigue of these glasses. (32 refs.)

106837 Glass-forming in ternary tellurite systems. M.Marinov, V.Kozhukharov (Inst. of Chem. Technol., Sofia, Bulgaria), W.Vogel, H.Burger.
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.2-3, p.253-61 (1983). In English. (Otto-Schott-Colloquium on the State of Optical Glass Research 1982, Jena, Germany, 1982).
Presents results of glassforming investigations in binary- and ternary-component tellurite systems. Studies are carried out mainly on semiconducting and optical glasses. Semiconducting glasses from the systems TeO_2-R_mO_n-T_mX_n, TeO_2-R_mX_n-T_mX_n, where R_mO_n is a metal oxide, R_mX_n—a non-transition metal halide and T_mX_n—a transition metal halide (fluoride, chloride or bromide) have been investigated at atm. pressure, for glass formation ability and some physicochemical properties. A detailed study has also been carried out for glass formation in systems without transition metal oxides. The authors have used the combinations: TeO_2-P_2O_5-R_mO_n, TeO_2-P_2O_5-R_mX_n, TeO_2-B_2O_3-R_mO_n, and TeO_2-B_2O_3-R_MX_N, as a basis for stable optical glass preparation, the latter exhibiting high values of refractive index and low dispersion. This has been accomplished with several tellurite-metaphosphate and tellurite-metabolrate ternary systems. (35 refs.)

42.72 OPTICAL SOURCES AND STANDARDS

(for spectroscopic light sources, see also 07.65)

106839 Modified AC light source for constant output. A.J.Burke (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.2, p.637-9 (July 1983).
The author describes a synchronization circuit which effectively modifies an AC light source to provide a constant output to an optical signal. (no refs.)

106840 Conversion of a light beam by an intricate quasi-stochastic system of diffusers. A.V.Gnatovskii, M.I.Kovelenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.7, p.1108-9 (July 1983). In Russian.
Discusses the possibility of directed formation of light field with averaged spatial-angular characteristics using various quasi-stochastic systems of diffusers, connected by an aperture. (3 refs.) *V.G.P.*

42.78 OPTICAL LENS AND MIRROR SYSTEMS

(for microscopes, see 07.60P; for photographic instruments, see 07.68; for astronomical telescopes, see 95.55)

106841 Application of VanderLugt's operational notation to finite aperture lens systems: comment. D.Stoler (Riverside Res. Inst., New York, NY, USA).
Appl. Opt. (USA), vol.22, no.16, p.2405-7 (15 Aug. 1983).
Comments on Hagler's work (see ibid., vol.22, p.768, 1983) the content of which is that, when the numerical values of the parameters permit, one should treat finite apertures by means of the method of stationary phase. (2 refs.)

106842 Optical performance of a diffraction-limited molded-glass biaspheric lens. R.O.Maschmeyer, R.M.Hujar, L.L.Carpenter, B.W.Nicholson, E.F.Vozenilek (Res. & Dev. Labs., Corning Glass Works, Corning, NY, USA).
Appl. Opt. (USA), vol.22, no.16, p.2413-15 (15 Aug. 1983).
Optical performance results are reported for a molded-glass biaspheric lens. The 6-mm optical diam lens is intended for use in a laser-based optical disk application. The design with fabrication tolerances has an expected on-axis transmitted wave-front performance of 0.06-wave rms optical path difference (OPD) when tested at 0.6328 μm and a numerical aperture of 0.45. Transmitted wave-front aberrations were measured on actual molded lenses using a heterodyne interferometer. Typical performance was 0.05-0.08-wave rms-OPD. Experimental results involving mold rotation indicate that lens performance is primarily limited by a surface figure accuracy of one of the molds. (1 ref.)

106843 Grazing incidence toroidal mirror pairs in imaging and spectroscopic applications. A.M.Malvezzi (CISE, Milano, Italy), G.Tondello.
Appl. Opt. (USA), vol.22, no.16, p.2444-7 (15 Aug. 1983).
The optical performance of pairs of toroidal mirrors in grazing incidence has been studied analytically and numerically. Two types of toroidal surface are possible: football and bicycle tire. In grazing incidence and for configurations that compensate up to second-order aberrations, there are significant differences in performance between the two types. For football-type tori the best configuration appears to be *Z*-shaped with tangential and sagittal foci at the

middle point between the mirrors. For bicycle tire-type tori the best configuration is *U*-shaped with the tangential focus at the middle point and the sagital at infinity. (6 refs.)

106844 A method of synthesis of optical coverings which uses the necessary optimality conditions. A.V.Tikhonravov (Dept. of Math., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.108-10 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.91-3 (1982).
The study of necessary conditions for a minimum of the estimator functional in the problem of synthesis of optical coverings, leads to a result which is analogous to the Pontryagin principle of the maximum. It is shown that these results can be used for the construction of solution of the synthesis problem. (7 refs.)

106845 Design and testing of lenses for optical disk technology. P.Kuttner (Optische Werke G. Rodenstock, Munchen, Germany).
Opt. Eng. (USA), vol.22, no.4, p.473-8 (July-Aug. 1983).
Optical disk technology today finds widespread application in laser vision, compact disk, and data storage equipment. The required specifications of lenses which meet these requirements are discussed. Their image quality is given by RMS of wave aberration, by point spread function by encircled energy, or by modulation transfer function (MTF). Due to the automatic servo focusing technique, a certain amount of field curvature can be tolerated. Measured results of image quality are compared with theoretical values. (16 refs.)

106846 Method for numerical investigation of adaptive optical aperture sensing systems. M.A.Vorontsov, S.S.Chesnokov (Moscow State Univ., Moscow, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.939-46 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1310-18 (Nov. 1982). [received: Sept. 1983]
A method is proposed for analyzing multichannel adaptive aperture sensing systems numerically, based on calculation fo the increment to the functional being optimized (quality criterion) via the solution of auxiliary problems. The method permits studying the operation of an adaptive system with an arbitrary number of control channels. The influence of the configuration of the receiving aperture and the properties of the reflecting surface of the object on the efficiency of adaptive focusing of radiation in a linear randomly inhomogeneous medium is analyzed using numerical solutions. 106847 Limit of concentration for cylindrical concentrators under extended light sources. J.C.Minano, A.Luque (Univ. Politecnica, Inst. de Energia Solar, Madrid, Spain).
Appl. Opt. (USA), vol.22, no.16, p.2437-43 (15 Aug. 1983).
Cylindrical concentrators illuminated by an extended source with an arbitrary distribution of radiance are analyzed taking into account basic properties derived from the Fermat principle and not from the specific concentrator shape. The upper limit of concentration achievable with this type of concentrator is obtained and it is found to be lower than that of general (3-D) concentrators. Cylindrical compound parabolic concentrators are analyzed in the light of this theory, and it is shown that they achieve the highest optical concentration possible for a cylindrical concentrator. 106848 Optical transmissivity of magneto-optic switching elements. B.Hill (Philips GmbH Forschungslab. Hamburg, Hamburg, Germany).
Philips J. Res. (Netherlands), vol.38, no.3, p.150-63 (1983).
Magneto-optic switching elements are used in the light switching array LISA, a linear array of miniaturized light valves integrated on a garnet chip. LISA has been developed for high resolution optical printers on the basis of electrophotography or for grey-scale electronic recording on photographic material. In this article the optical properties of a switching element of LISA are outlined as a function of the wavelength of light. The typical features for special applications are summarized, and design rules for optimizing the component in view of the application are given. (8 refs.)

106849 Spatial filtering by a spherically illuminated coherent optical processor. R.S.Kasana (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).
Acta Phys. Pol. A (Poland), vol.A64, no.2, p.239-47 (Aug. 1983).
This paper reports on the spatial filtering in the case of a spherically illuminated processor consisting of a single lens or a pair of lenses. Various theoretical conditions for using it in different forms have been established. The flexibility provided by this type of (general) illumination in scaling parameter and Fourier-transform planes is investigated. The salient features of this processor are also discussed here. A simple spatial filtering technique has been utilised for generating higher frequencies which are arranged in the form of an interference matrix. A condition for achieving the exact Fourier transform without using any collimating device has been theoretically investigated and experimentally verified. It is also proved that the processor illuminated by parallel light is a particular case of this. Several spatial filtering operations have been performed with the exact Fourier transforms and the results obtained in both cases of a coherent optical processor illuminated by spherical as well as collimated wave fronts have been compared. 42.80C Spectral and other filters

106850 Harmonic response of a tunable Solc filter. J.F.Lotspeich, R.R.Stephens, D.M.Henderson (Hughes Res. Labs., Malibu, CA, USA).
Appl. Opt. (USA), vol.22, no.17, p.2743-6 (1983).
The spectral evolution and transitional behavior of the odd harmonic windows in a broadly tuned electrooptic Solc filter are described theoretically and demonstrated experimentally. The authors show how the fundamental and all the odd harmonic passbands split and eventually merge in pairs with nearest neighbors to become even harmonics of the fundamental λ_f as the principal pass wavelength λ_p is tuned from $\lambda_p=\lambda_f$ to $\lambda_p \gg \lambda_f$. 106851 Efficient femtosecond optical Kerr shutter. J.Etchepare, G.Grillon, A.Migus, J.L.Martin, G.Hamoniaux (Lab. d'Optique Appl., Ecole Polytech.-Ecole Nat. Superieure de Tech. Avancees, Palaiseau, France).
Appl. Phys. Lett. (USA), vol.43, no.5, p.406-7 (1 Sept. 1983).
Conjugated molecules, with large optical nonlinearities, are tested as materials usable for femtosecond optical Kerr shutter technique. With β-carotene, in acetone solution, the authors have achieved responses limited by the 100-fs width of the optical pulses and characterized by a resolution better than 1 ps with a dynamic range of 100. (13 refs.)

106852 A prism reflector of anti-resonant ring configuration. I.D.Carr, D.C.Hanna (Dept. of Phys., Univ. of Southampton, Southampton, England).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.447-50 (Sept. 1983).
Two identical prisms are combined to form an anti-resonant ring reflector, giving total reflection without the use of coatings or roof edges. When used as the total reflector in a Q-switched Nd:YAG laser this device has shown a damage threshold twice that of a multilayer reflector. (11 refs.)

42.80F Gratings, echelles

106853 Mechanically ruled aberration-corrected concave gratings for a polychromator with a self-scanned sensor array. T.Kita (Hitachi Ltd., Central Res. Lab., Tokyo, Japan).
J. Spectrosc. Soc. Jpn. (Japan), vol.32, no.3, p.173-82 (1983). In Japanese.
A method of designing a mechanically ruled aberration-corrected concave grating and its mounting for a polychromator with a self-scanned sensor array is described. An aberration-corrected concave grating with flat detection field and astigmatism free focusing properties has been designed and fabricated for a wavelength-meter to measure the laser diode oscillation in the wavelength range of 720-820 nm. The grating has been designed so as to take also the linearity of wavelength and the channel number of a sensor array into account. (11 refs.)

106854 Diffraction grating efficiencies. An exact differential algorithm valid for high conductivities. R.A.Depine, J.M.Simon (Dept. de Fisica, Univ. de Buenos Aires, Buenos Aires, Argentina).
Opt. Acta (GB), vol.30, no.9, p.1273-86 (Sept. 1983).
An exact differential algorithm is developed, using a conformal transformation for the half-space outside the grating and a non-conformal transformation that coincides with the former for the interior of the metal. As an example, the theory is applied to the $\mathbf{E}_\parallel$ mode for a cycloidal profile. (8 refs.)
